Reforming Tax System

In considering a switchover to VAT or any of its variants what is of fundamental importance is the effect it has on resource allocation in the economy and resource transfer to the government. The revenue generated under the alternative systems and the structure and relative prices associated with each need to be carefully understood. Another issue that has come in the way of a proper assessment of alternative tax systems is the question of cascading. The central issue of revenue neutrality and relative prices under alternative tax systems need to be examined. **1581**

Nation State Under Scrutiny

The feeling that the nation state is in trouble and that it will not survive the growing pressures from within and without may not stand close scrutiny. At most it can be said that the state is in crisis as it faces a world that is undergoing transformation, which is subjecting it to diverse pressure, including for reducing its traditional role in human affairs. **1593**

Unsafe, Insecure

To capture the reality of the situation of women workers in the informal sector and to understand women's social agency in the sphere of production is difficult, if not impossible. Public hearings provide a platform for accessing this information and contending with their problems. **1551**

A recent survey to determine whether construction workers were receiving minimum wages specified under the act reveals poor compliance even on the part of state establishments. **1540**

Dismantling Men

Anand Patwardhan's film, 'Father, Son and Holy War', a documentary on the Hindu Right and its legacy of communal violence offers a strong exposure of patriarchy and the beginnings of a critique against masculinity, perhaps the first of its kind in Indian cinema. **1610**

Aids to Learning

Do literacy primers being used in the total literacy programme reflect the reality of people's lives? What are their ideological underpinnings and whose interests do they serve? **1559**

Re-writing History

Rather than privileging , as the post-modern critiques of history have, canonical histories, it might be time to forget the nation and the nation as history and turn our inquiring mind to 'temporality' as the thread of history. **1570**

Trickle Back

Oustees from Gujarat's 19 villages which will be submerged by the Sardar Sarovar project who have been settled in sites close to Baroda, have begun to trickle back to their villages of origin **1555**

Advantage Syria

Syria's improved military strength after the Gulf War has improved its bargaining position vis a vis Israel and the US, especially since the latter is under some pressure at home to take a definite stand on the issue of Golan Heights. **1562**

Out of Court

The Supreme Court bench dealing with the clutch of Ganga pollution cases is expanding its responsibility outside the courts to ensure that action recommended is indeed taken. But unless the administrative set up is strengthened its efforts will have been in vain. **1557**

Dalit Assertion

What happened in Kadi is as much a sign of the rising assertiveness among the dalits as a measure of the sort of misrule possible under a government insensitive to these issues. **1558**

Population Politics

There seems to be a consensus among all political parties that the country's increasing population is a stumbling block in the development of the nation. This accepted wisdom needs to be questioned. **1617**

Development or Destruction?

THIS is with reference to the article by Vidhya Das (June 3). All three partners in this joint venture alumina project are committed to sustaining the environment, controlling pollution and minimising disturbance to the society of which we are about to become members. It was because we felt the need for independent opinion and guidance in these areas that we have closely involved the National Institute of Rural Development, Hyderabad, and the Tata Institute of Social Sciences, Bombay, in advising us on rehabilitation plans as well as on community development activities.

The plateau which is to have the bauxite mine has no human habitation. As for the plant site, we selected the present location with a view to minimise displacement of people and minimise acquisition of existing agricultural land or green areas. The technology to be used in the plant as well as in disposal of red mud waste is more advanced than any other in India. That is why this present project, despite being larger than the Nalco plant, is going to use approximately 55 per cent less land. The people likely to be affected are from one hamlet of Korol, one hamlet of Dimundi and Rambera village. They have been explained in detail by our people and shown the alternative land for their resettlement. In fact, if one alternative area is not found suitable by the people, another plan is worked out to suit their needs and requirements. Therefore, we believe that it is neither fully correct nor fair to say that the local people have not been told anything except that they have to leave.

As for the impact on the environment, the Utkal project mining lease does not fall within any declared forest area. About 100 hectares falls within the category of 'village forests' (under the state revenue department), for which we have engaged the services of a specialist consultant and developed alternative compensatory afforestation plans, and identified land for the same in surrounding areas. Ground and surface water studies have been carried out by the National Geophysical Research Institute, Hyderabad, who have confirmed that soil contamination will be negligible. We are nevertheless ensuring stringent preventive measures. The 'dry stacked' red mud storage area will be properly restored after use, through extensive plantation. We do this as a matter of routine; a visit to Indal's Belgaum Alumina Plant will prove the point.

Since this project does not envisage downstream conversion of alumina into aluminium metal at that site, the question of carbon residue, fluoride emission and other effluents associated with smelters does not arise. Further, the Indian Toxological Research Institute, Lucknow, has studied the impact of the proposed alumina plant on the drainage system and concluded that there will be no adverse impact. They have also conducted environment impact studies, collecting baseline data over a period of two years on noise, dust, air, water, to determine the existing ambient levels to help us ensure that the same are not exceeded in future. A detailed study by the Central Water and Power Research Station of the ministry of irrigation has concluded that the siltation effects are insignificant in view of stringent control measures adopted by the project.

Unlike other mining operations, Utkal will be minimising the 'drill and blast' mining method. As a result, the noise level will not be more than existing ambient levels. The dust in the mining area, to be controlled through the atomised dust suppression system, could well be less than the ambient dust levels. The run-off water from the mine will be guided through checks dams, siltation tanks and a network of garland canals so that solid particles are captured and retained, and the outflow water has less solid particles than even ambient levels. At our Durgmanwadi mines in Kolhapur, Maharashtra, the noise, dust and water levels are monitored by the independent Sahu Institute of Kolhapur. At Baphlimali too, environment/pollution monitoring will be by external agencies and the records will be open to scrutiny. At Baphlimali we also propose to have a 15 metre wide peripheral barrier to separate the mine slopes from the surrounding region. After mining, the top soil (overburden) will be back-filled on to the mined area and trees will be planted. There will be plantations along the plateau slopes as well. Trees do not grow on bauxite plateaus. That is why they are barren, dusty and have plenty of suspended solids in run-off water. It is only after the bauxite is removed that trees can take root and flourish. Again, we would refer to Indal's mining operations in Maharashtra, where we started mining only about a year ago, but have already planted nearly 75,000 saplings of varieties endemic to that region.

While the Utkal project will generate some direct and indirect employment, it would still not be enough to uplift the livelihood of that entire region. However, we are taking steps even now, i e, well before the pace of project implementation picks up, to upgrade the ITIs in Koraput and other contiguous towns. Then we will select groups of youths from among the local population and train them in these facilities, so that they can find meaningful future employment in projects such as ours and others that will come up in the region. Utkal Alumina has already commenced work on a few pilot community development projects such as health camps, vocational training in pottery, improved drinking water supply to some villages, and spreading improved agricultural practices. We are always open to advice and guidance on our activities, and to that end we are also open to interaction and information sharing with organisations similarly active in the area. We believe that if both sides are honest to their purpose and objectives, meeting grounds can be created, on the basis of which we can have economic progress at minimum cost to our ecological and social heritage.

Making Research Pay

THE CSIR in response to the changing national and international economic, trade and intellectual property environment [has] re-oriented itself to be more user-responsive and market-driven." So reads the preamble to a recent paper presented by the Council of Scientific and Industrial Research (CSIR) to the prime minister's office, heralding what is termed as a new focus for the premier agency. The paper is said to document changes which are already in place in response to the government's directive that CSIR laboratories should earn at least 33 per cent of their budget allocations. This will further hasten the CSIR's move away from what is seen as basic reasearch to 'applied' research.

There can be no gainsaying the fact that the CSIR has been lackadaisical both in developing relevant processes and in marketing them. Technologies developed here have had a poor uptake from industry – because the processes are unrelated, inappropriate or have been at too rudimentary a stage for industry to develop further. The other side of the picture is more complex: on the one hand, Indian industry, in general, did not have either the vitality or the inclination to pick up these technologies; but on the other, it made use of state-established research and development resources by contracting, albeit haphazardly, premier institutions (such as the IITs) to undertake research projects of their choice. In either case, the CSIR hardly benefited continuing to suffer the criticism of underemphasising applied research.

The roots of the crisis in Indian science today, illustrated by the abject state of research agencies like the CSIR, lie elsewhere: in the government's attitude to science and technology. While reams of paper have been wasted on glorifying science and its promotion, the centre's budget for science and technology has remained 2 per cent of the total allocations for decades. And of this a major portion goes to big money-guzzlers like the atomic energy, space and ocean development. The CSIR, the Indian Council of Agricultural Research, the Indian Council of Medical Research were envisaged not only as centres for pursuing research but as nodal agencies for creating an ethos for scientific research in their areas. They have increasingly become networks of laboratories with poor financial support and little administrative freedom to encourage creative leadership within them. Linkages with industry, agriculture and health needs, respectively, have been underdeveloped.

Scientific research has always been viewed as an esoteric enterprise – few of the development programmes in the various ministries has ever had a functioning research and development component. For example, such a component in the irrigation departments could have tackled issues such as the impact of irrigation on the surrounding soils, on the flora and fauna, on the spread of vector-borne diseases, and on the people, which in turn would undoubtedly have led to what are termed basic research problems. This linkage, the integration of 'development' whether in industry or elsewhere with the research enterprise has never received attention.

The other problem that has beset scientific enterprise in India has been the premise that science has to be harnessed to development. Such a philosophy can take root in a political and economic climate where science itself is seen differently, historically as a product of people's endeavour and currently, as itself empowering people to define the goals of development. But in class society under the bourgeois state, the concept suffers the inevitable distortion. As has happened in India, a crude and arbitrary division takes place between basic and applied research, with the implication that the latter is directly related to development in material terms – in the building of industry, harnessing of natural resources, etc – and the latter is only a sort of investment for the future. While certainly in the allocation of scarce resources necessary prioritisation has to be made, such a process must be dictated by the identification of people's needs – for instance the need for a alternative energy resources where all components from the basic to the applied would need to have the same emphasis. It is also a fact that fields not burdened with the need to produce 'applied science' are the ones which have made tremendous contributions to knowledge which in turn has spurred applications, for instance, developments in mathematics, astronomy, etc. The devaluing of science has a cumulative and long-term effect: Even at the undergraduate level, science streams are no longer chosen, but simply suffered because other streams of medicine, technology, etc, are not available. In a sense we are witnessing also the devaluation and the degeneration of the methodology of science with its central focus of rational enquiry.

It is sad commentary indeed that the premier research agency of a country that is supposedly poised to enter a new and expansive phase in its development, should narrow its vision to become more "user-responsive" and "market-driven" instead of strengthening and revitalising the roots of scientific enterprise. This unrooted endeavour is not likely to produce anything but garden variety innovations. That regional research laboratories should harness their considerable scientific talents to setting up patent consultancy services, whatever their practical advantage, is a misuse of the enormous resources which have been invested in creating these infrastructures. While certainly, there is a need for CSIR to reorient itself to the changing environment, its current intense preoccupation with making research pay may well result in the opposite – there may not be any research at all.

CONSTRUCTION WORKERS

Gross Negligence

AMONG the most vulnerable and poor segments of the unorganised sector working class is the building and construction industry workers. Apart from the general absence of job security, as well as the irregularity and seasonal nature of the jobs, most construction workers have to move from place to place seeking construction sites. The living conditions of the families of construction workers are appalling. Except for the Minimum Wages Act, 1948 under which the government of India is responsible for the fixation and revision of minimum wages in 'construction of roads or in building operations' as one of the 40 scheduled employments notified under the act, there is hardly any law which aims at regulating the employment and conditions of service of workers in this important and growing area of economic activity. Interestingly, it is now revealed that even the enforcement of the Minimum Wages Act by the authorities is mostly directed towards establishments possessing a licence or registration under the Contract Labour (Registration and Abolition) Act, 1970; establishments operating without the requisite registration or licence for carrying on business with contract labour, those not covered by the Contract Labour Act and a large number of unauthorised and clandestine constructions hardly receive the attention of the enforcement authorities.

Though the union ministry of labour has been quoting a figure of eight million as the total employment in the construction industry, the National Sample Survey results had placed the number of workers normally employed in construction at 12 million in 1987-88. All evidence suggests that the construction industry has been the fastest growing even insofar as the employment of unorganised labour force is concerned. This segment of the informal sector labour force deserved special attention from the authorities. And year after year, the union ministry of labour, in its annual report, has been stating that a proposal for enactment of a central legislation for the building and other construction workforce with a view to regulating their employment and conditions of service and providing for their safety and welfare was being vigorously pursued in consultation with other concerned ministries like surface transport, urban development, railways and finance and in the light of experiences of states like Kerala and Tamil Nadu where certain welfare schemes for construction workers were already under implementation. It looks as though serious ideological pressures under the impulse of economic liberalisation are coming in the way of evolving some rudimentary protection to the growing but vulnerable sections of the working class.

It is against this background that one should be dismayed at the results of the evaluation study on the implementation of the Minimum Wages Act, 1948 in the construction industry in the state sphere in the union territory of Delhi. The evaluation study was split into two phases (March 4 to March 22, 1992 and April 19 to May 10, 1992) so as to allow some more time for the enforcement and publicity of wage rates revised through the half-yearly wage revision effective from February 1992. Since May 1, 1989, the minimum rates of wages of building and construction workers had been linked to the consumer price index numbers so as to bring them on par with the organised industrial workers insofar as time-bound wage revisions were concerned. According to the study only 20 per cent of the unskilled workers in the establishments surveyed were receiving the prescribed minimum wages. The proportion of unskilled workers in the total labour force was as high as 70.6 per cent. About 83.3 per cent of the unskilled workers had a rural background, 86.6 per cent were illiterates and 79 per cent had less than one year's service to their credit. Employment of female workers was confined to the unskilled category and the level of minimum wage compliance in respect of them was 16.7 per cent as compared to 21.2 per cent for their male counterparts. In other words, 83.3 per cent of female workers and 78.8 per cent of male unskilled workers received less than the prescribed minimum wages. The evaluation study thus characterises this category of unskilled workers as "the most vulnerable section of the workers in building and construction establishments".

The overall compliance level in regard to the prescribed minimum wages for all workers together was 57.8 per cent which was, of course, mainly attributable to the pitifully low compliance of 20 per cent in respect of unskilled workers. Thus, the half yearly wage revisions hardly made much of a difference to a vast majority of the unskilled workers. Interestingly, only about 26.5 per cent of the establishments covered by the study had been inspected by the enforcement officers.

The mere knowledge of an evaluation study being undertaken by the authorities seems to have improved the compliance performance, with the level improving from 9 per cent during the first phase of the study to 27.8 per cent during the second phase in respect of unskilled workers and from 48.6 per cent to 63.9 per cent for all workers together. In general, the compliance with the minimum wages in respect of semi-skilled, skilled, and clerical and supervisory staff was, according to the report, highly satisfactory as almost all of them were getting the prescribed wages.

JANATA DAL

Leaderless Chaos

THE three-day national camp at Attibele in Bangalore, instead of emerging with one voice, ended in a cacophony. Though there was the brave talk of forgetting the past and forging a new future, the overall impression conveyed by the meet was that the leaders were interested in settling previous scores. After the breakup of SP-BSP in UP, a certain section of the JD wanted the SP to be included in the National Front. But Laloo Prasad Yadav, against whom Mulayam Singh campaigned in the recent assembly polls in Bihar, staunchly opposed the move. Laloo Prasad, after his triumph in the Bihar elections, aims to emerge as an uncontested leader of the yadavs in the northern belt. Notably, the victory rally felicitating Laloo Prasad was organised in Sambhal in Moradabad district of UP, the home territory of Mulayam Singh. Sharad Yadav's suggestion that the JD should keep its options open towards BSP has invited the ire of Ram Vilas Paswan who is planning to project Phoolan Devi against Mayawati and anoint himself as the leader of the dalits in the Hindi belt. It is this tendency to expand one's support base while chipping at the other's that has caused mutual resentment within the JD.

Another factor which disturbingly raised its head in the JD conclave is the extent to which the party and its ally, TDP, in the National Front are seriously committed to building a secular front. The overtures of Deve Gowda and N T Rama Rao to AIADMK to join the Front indicates that in spite of drawing up a minimum programme of action against the new economic policy, communalism and corruption, a different set of calculations seems to dominate their minds. Their argument that joining hands with AIADMK will ensure 100 seats from the south, besides leaving their long-standing ally, DMK, in the cold, defeats the purpose of secularism and reveals how amorphous their formulation of anti-Congressism is. This line of thinking also afflicts Sharad Yadav's background paper on JD's strategy for the coming Lok Sabha polls. Classifying the states into five categories on the basis of the relative strength of JD and its allies, the paper advocates an alliance with Arjun Singh in Madhya Pradesh, if anti-Congressism is to prevail. This mechanistic thinking purely in terms of seat adjustment dilutes the common programme of NF-LF, and instead inaugurates a coalition of all and sundry parties who will, no doubt, later

bicker amongst themselves for a share of the cake.

After the JD initiative in formulating poll strategy, there seems to be two distinct patterns of alignment emerging across the nation. First is the attempt made by the 'national' parties like the Congress, the BJP, to forge alliances with the regional parties in various states in case a hung parliament eventualises. The other is the one chalked out by the NF to form a front of various regionally dominant parties. It seems that the latter strategy can prove to be more friction-ridden, if some rigour is not maintained in the selection of the allies. Also, unlike 1989 when V P Singh symbolised the anti-Bofors forces targeting the centre, the leadership post in the present-day JD lies vacant. The party is like a torso without a head. That its regional chiefs, under the influence of various pulls, have not been able to give a cohesiveness to the JD is what the Bangalore meet has conveyed to the people.

G 7 SUMMIT

Fire Fighting

THE principal purpose of the G-7 summits is supposed to be to sort out mutual economic and financial difficulties. And there certainly was no shortage of such problems at the Halifax Summit in June, with Bosnia being at the top of the pile But some of these problems have become obstinately hard to sort out and some others do not admit of solution because of the obstinacy of the key players. Unemployment in the developed world could be said to belong to the first category; the US trade dispute with Japan over automobiles and auto parts belongs to the latter category. The US is simply unwilling to abide by the charter of the newly-established World Trade Organisation in regard to conflict resolution. It insisted on invoking its own bilateral sanctions should Japan not agree to its terms.

Where does the matter of IMF reform belong? It is a question that has dogged the international community for quite some years, particularly since the early 1980s, but thanks to the distorted perspectives of the majority of G-7, all that has been attempted so far is to attend to the immediate crisis.

The IMF was set up after second world war with the objective of functioning as a sort of World Central Bank which would monitor the international financial scene and insure, through timely intervention against destabilising movements. But like any central bank, the IMF needed to be armed with not only adequate powers of surveillance and monitoring but authority to enforce certain requirements of behaviour, backed of course with sufficient resources. Unfortunately, the IMF was armed with very limited powers and resources, although vesting a near total control over its decision-making in the hands of just one country, the US, given its effective veto.

The result has been a piecemeal approach to problems crying out for long-term solutions. The basic problems of shortage of international liquidity was never tackled at the multilateral level and ultimately, private banks took over. Consequently, the problem took the shape of volatile, unregulated movements of capital across national borders. The international community continues to be unable to face the problem. All that it has done so far is to attend to cases as and when they have arisen, the latest being Mexico.

The Halifax Summit, no doubt, discussed the question of creating a mechanism to tackle Mexico type crisis and agreed to create an emergency financing mechanism by refurbishing what was so far known as General Arrangement to Borrow (GAB) within the IMF. But how inadequate this new arrangement could be can be judged by recalling that for Mexico alone something like $ 40 billion had to be mobilised and now the IMF will have just $ 58 billion to cater to the entire world, developed and underdeveloped. Are they really serious?

URBAN DEVELOPMENT

Long Neglect

AS the Fourteenth Report of the Standing Committee on Urban and Rural Development of the Tenth Lok Sabha points out with reference to its concerned department, "The Annual Report... is an important document by which not only the progress of the various schemes can be known but also the performance of the ministries concerned can be verified. It is also relied upon by members of parliament while participating in the discussion on the annual budget." And yet, an annual report which gives reliable and up to date information on the ministries/department's programmes is more the exception than the rule. The quality of the reports and the ministries' lackadaisical attitudes to the document is well- illustrated by the remarks of the standing committee on the ministry's annual report of 1992-93.

The standing committee, clearly taking its task seriously, has pointed out that since the ministry is supposed to have established "close monitoring system for getting information and feedback on programmes", such information should be made available in the annual reports. With amazing nonchalance the ministry, narrowing its response to the matter of water supply and sanitation has replied that it has no organised monitoring cell to keep track of the projects on a regular basis. That the ministry which is in charge of formulating and directing policy on urban development should acknowledge this, shows utter disregard not only for mandatory requirements, but a certain disinterest in pursuing its purposes. In fact the annual report of the ministry (now called the ministry of urban affairs and employment) for 1995-96 admits its role includes planning and policy formulation, but it is obvious that the recommendations of the standing committee have made no impact on the preparation of the report. For instance, the section on water supply and sanitation, which had come in for considerable comment in the standing committee report, continues to merely list programme objectives, funds released and targets achieved, with regard to utilisation of funds. To quote the standing committee report, "The main point is whether the required population is getting adequate facility or not, whether the quality of facility available is socially acceptable or not Therefore, the committee would like to recommend that population coverage under water supply and sanitation system must take into account the adequacy and the quality of the facility provided in order to avoid nullification of the very purpose for which the facilities are meant". The standing committee had pointed out the discrepancy between the ministry's claim that 46 per cent of the urban population in India is covered by sewerage and sewage facilities and the WHO report of the Commission on Health and Environment 1992 which points out that only 209 of the 3,119 towns (7 per cent) are partially covered by such facilities. The ministry has gone into a convoluted explanation about the difference in the base number on which the two figures are based and admits that the ministry has no town/ citywise updates on programme coverage. Interestingly enough, the last year's annual report dispenses entirely with programme coverage data, confining itself to utilisation of funds

In the Sixth Plan, with a belated recognition that urban development needed more than the cursory attention it had received till then, the integrated development of small and medium towns scheme (IDSMT) was launched and has continued through the Eighth Plan with an allocation of Rs 155 crore. Interestingly, other than mentioning the guidelines on which the towns are chosen for the scheme, and noting the amounts utilised, there is no information on the actual coverage and no indication about what 'development' if any has taken place in these towns.

PAKISTAN

Mayhem in Karachi

If Kashmir is a thorn in Narasimha Rao's side, he can take comfort in the thought that Benazir Bhutto is nettled by happenings in Karachi. If the secular image of India gets a sound drubbing when the world watches it amassing its armed forces against the Muslim minority in the Valley, Pakistan's much-flaunted Islamic ideology equally loses its credibility when it is seen turning its guns against its own co-religionists – the Mohajirs – in Karachi.

The symbiosis between Benazir's increasingly shrill obduracy in the face of Mohajir demands, and the Mohajir Quami Movement's (MQMs) escalating terrorism has wrought havoc with the lives of Karachi's ordinary citizens. The latest mayhem was sparked off by the rape of the sister of an MQM activist, allegedly by members of a rival faction (the Haquiqe) which enjoys the patronage of the all powerful Inter Services Intelligence (ISS) of the Pakistani defence establishment. The MQM alleges that the Urdu-speaking Muslims who migrated from India to Pakistan after partition expecting a homeland where they would be treated as equal citizens, are reduced to third class citizens who do not enjoy fundamental constitutional rights and economic opportunities in proportion to their numbers. In its movement to demand redressal of their grievances – which had become increasingly violent in retaliation to state repression – the MQM has lost hundreds of its activists to police and army bullets, and hundreds are either in jail, or on the run (including its leader Altaf Hussain, who is in exile in London, and fears that he will be killed if he returns to Pakistan).

But the MQM is not as lily-white as it claims to be. During its turbulent history of a little over a decade, it has demonstrated by its actions that it can be as morally unscrupulous and politically opportunistic as the LTTE of Sri Lanka, or the Khalistanis of Punjab. Like Prabhakaran and his followers of the LTTE who had no scruples in requesting military training from the Indian RAW for the 'liberation movement' (when the RAW itself was engaged at the same time in suppressing similar 'liberation movements' in the north-east of India), or like Bhindranwale who rose to prominence by accepting the role of a pawn in Indira Gandhi's hands to serve her purpose of marginalising and dividing the Akalis in Punjab, the MQM leader Altaf Hussain had shifted his loyalties from one patron to another in order to strengthen his clout in Pakistan politics.

In Pakistan, it is widely known that Altaf Hussain formed the MQM during the Zia regime, with the blessings of the ISS, which used it to marginalise Bhutto's Pakistan People's Party (PPP) in Sindh, where the Mohajirs are mainly concentrated, forming 40 per cent of its population. After a brief honeymoon with the PPP following the formation of Benazir's first government in 1988, the MQM fell out with her. But all through these vagaries of political alignments and re-alignments in national politics, the MQM managed to steadily increase its electoral strength, emerging as the third largest party in the National Assembly after the October 1990 general elections. The movement, however, has acquired a notoriety over the years for violent and intolerant activities by its leaders and ranks – both against dissidents within the MQM and Urdu-speaking Mohajirs outside who did not toe its line, – recalling the violence-ridden history of the Tamil Tigers, the Khalistanis, and the Kashmiri militants directing their vengeance against members of their own respective communities. The accession of the criminal underworld of Karachi, armed with sophisticated weapons siphoned off from the state-patronised Afghan mercenaries, to the MQM is diluting whatever political position (of demanding institutionalisation of Mohajir demands for equality and protection of their cultural identity) that the MQM might have had taken to mobilise the Urdu-speaking migrants. But then again, Benazir Bhutto cannot simply resort to a military solution – which she is doing – in response to what has exploded today into a law and order problem from long-accumulated social and economic grievances of the Mohajir community, which her government continues to ignore. Unless she succeeds in resolving these grievances, the Mohajirs of Karachi will continue to empathise willy-nilly with the MQM – despite its authoritarian and terrorist activities. The situation again has a parallel in Kashmir, where due to the decades-long central indifference to the grievances of the people there, popular protest has gathered around the various terrorist outfits.

Ironically, notwithstanding Benazir's pathological loathing for New Delhi, she is taking a leaf out of the Indian government's repressive policies regarding Kashmir. While Karachi, like the Valley, continues to remain paralysed by strikes and militant actions, Islamabad is preparing an army crackdown, and has asked non-Mohajirs to quit Karachi while cutting off the city from all communications – shades of Kashmir in January 1990, when governor Jagmohan asked – and arranged for the evacuation of – the Hindu pandits to leave the Valley, preparatory to an army crackdown on the Muslim residents.

Twenty Years Ago

EPW, July 5, 1975

The far-reaching political changes ushered in with the proclamation of a state of emergency on June 26 notwithstanding, in the economic field the government is apparently not contemplating any startling change of direction or policies. The emphasis, it is clear, will be on a more determined pursuit of the trends which have been increasingly in evidence in the last four years or so. In this context, the prime minister's broadcast on June 27, in which she announced that the government had no plans of nationalising industries or of imposing fresh economic controls, was no less significant than her subsequent broadcast on July 1 in which she spelt out what has now come to be known as the 21-point programme.

A major theme of the 21-point programme is that, in the Prime Minister's words, "we must go all out to increase production". In industry, licensing procedures had been "streamlined", leading to a sharp rise in the numbers of licences and letters of intent issued, illegally installed capacity had ben regularised in all manner of industries, the list of priority industries had been made progressively all-encompassing and imports of raw materials and components had been liberalised. Also, curbs on the expansion of large business houses had been dismantled and the anti-monopoly and anti-concentration provisions of the MRTP Act had been allowed to fall into to disuse.

One of the major items in the celebrated 10-point economic programme adopted by the AICC in June 1967 was that the growth of monopolies would be curbed and concentration of economic power would be prevented. By contrast, it is the implicit premise of the 21-point programme that increased production, from whatever quarter it may emanate, must be encouraged. Similarly, larger production, in whichever industry it may occur, is to be welcomed. Hence any tightening of the definitions of priority or essential industries is clearly ruled out.

In regard to the rural sector, the prime minsiter in her broadcast listed a number of programmes which are vital for improving the condition of some of the poorest sections of the population, such as landless labourers and small farmers, scheduled castes and adivasis.

Organisation of the rural poor is, vital for the realisation of those parts of the 21-point programme which are intended to benefit the landless, the scheduled castes, the adivasis and the like. How this can be done in the changed political conditions of today is something which should occupy the attention of all those who are committed to the goals of the programmes put forward by the prime minister.

S and Y Mills

S AND Y MILLS incorporated in 1994 have undertaken a project for weaving of polyester blended suiting materials, with an annual installed capacity of 14.88 lakh metres for which commercial production is scheduled to commence in July 1995. To part finance the project, the company will enter the capital market on July 14 with a public issue of 12,50,000 equity shares of Rs 10 each at par aggregating Rs 125 lakh. S and Y Mills will be listed on the Bombay, Madras and Coimbatore stock exchanges. The estimated project cost is of Rs 593 lakh, out of which the promoters are contributing Rs 298 lakh towards the equity and the balance of Rs 170 lakh is through term loan. Out of the total requirement of plant and machinery worth Rs 241.70 lakh, the company is acquiring second-hand plant and machinery worth Rs 141.79 lakh. However, out of the total 24 nos of Sulzer looms required for the project, the company has acquired only 12 looms so far. The company has no firm tie-up for the procurement of raw materials. It has obtained a temporary power connection from TNEB.

Mount Everest Mineral Water

Promoted by Dadi Balsara, an NRI from Singapore, Mount Everest Mineral Water is approaching the Indian capital market with an aggregate issue of Rs 1,164.28 lakh consisting of a public issue of Rs 72.50 lakh equity shares of Rs 10 each for cash at par (Rs 725 lakh) and firm allotments of 43,92,800 equity shares also at par (Rs 439.28 lakh). The company proposes to set up a fully integrated plant for the manufacture of polyethylene terepthalate (PET) bottles and natural mineral water rich in minerals such as bicarbonates, calcium and magnesium sourced from the Dhaula Kuan-Paonta Sahib area, district Simour, Himachal Pradesh. The company has technical collaboration with Fresenius Consult GmbH of Germany for planning, installation and commissioning of the plant. It also has a technical agreement with AOKI Technical Laboratory, of Japan for know-how and consultancy services for manufacture of PET bottles. As the proposed plant is located in a backward region, it will enjoy sales tax and income tax exemptions, for 10 years and five years respectively.

The PET bottles proposed to be manufactured by the company will use a stretch-blowmoulding process. The PET bottles, it is hoped, will have ready demand in the Indian market as they would be used for packaging of mineral water as well as for external sales to liquor and edible oil manufacturers. Likewise, mineral water is targeted especially at touring and travelling market segments; the total demand for mineral water was estimated at 1,000 lakh litres for the year 1993-94 against which the extant supplies stand at 799 lakh litres. Apart from the capital raised from the public issue, a foreign currency loan worth yen 165 million (526.11 lakh) has already been sanctioned by Bank of India. In addition, the company will have Rs 340 lakh of working capital and Rs 578 lakh of foreign letters of credit for import of raw materials and capital goods (the latter on one-time basis).

FGP

A pioneer in the fibre glass industry in India and with an uninterrupted dividend track record for over 23 years, FGP is making a rights issue of 69,97,536 equity shares of Rs 10 each for cash at a premium of Rs 25 per share aggregating Rs 24.49 crore. The company has bought over the glass fibre division of Ceat at Hyderabad. Also, the company has been facing a severe liquidity crunch as a result of the utilisation of short-term funds for modernisation of its furnace at Thane. Hence the present offer. However, the fund requirements have been estimated internally; they have not been appraised by any financial institution or bank. As a result, the utilisation of funds raised through the rights issue will be left entirely at the discretion of the management.

Jyoti Cosmetics

Jyoti Cosmetics (EXIM), which is setting up manufacturing facilities for toothpaste, liquid and all purpose cream, dendricial and general shampoo and almond lotion in Mehsana district of Gujarat, is approaching the market with a capital issue of Rs 7.50 crore. The project cost of Rs 11.30 crore will be financed, apart from the public issue, by promoters' contribution of Rs 3.80 crore. As per the estimates available, as against a supply of 30,000-35,000 mt, the demand for the products is placed at 40,000-45,000 mt worth about Rs 200-Rs 250 crore, thus showing a gap of about Rs 65 crore worth of products. Besides, there is also considerable export potential. The annual rise in the consumption of toiletries and cosmetics is found to be as high as 12 to 15 per cent.

Scan Organics

Engaged in the production of reactive dyes and gamma acid, Scan Organics is now planning to augment its operations by increasing capacity for gamma acid and manufacturing of dye intermediates, namely, bon acid, tobias acid, J acid and N methyl. For part financing in the project the company is making a public issue of Rs 6.45 crore. The government of India has identified dyes and dye intermediates industry as a major thrust area. The export potential for the industry has expanded because the manufacture of dyes and dye intermediates is being phased out in industrialised countries. The actual exports from India is already growing at the rate of 15 per cent per annum.

CURRENT STATISTICS

EPW Research Foundation

The annual inflation rate has eased further to stand at 8.2 per cent for the week ended June 17. However the final figures may be higher. For the first four weeks of 1995-96 the inflation rate based on final WPI is about 1 per cent higher than that based on the provisional indices. The phenomenal rise in net RBI credit to the centre continues and is reflected in sizable currency expansion. The loss of bank deposits over March 31 this year has been larger at Rs 6 795 crore (or 1.8 per cent). In the primary floatations the yields on 91 day TBs have further firmed up from 12.07 per cent to touch the record high of 12.58 per cent. All round liquidity shortage continues also evident from the poor response to the second auction of the 14 per cent 10 year GoI stock.

@ Based on the daily quotations supplied by Mecklai Financial and Commercial Services Ltd, Bombay.

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript ' stands for July, (ii) Figures in brackets are percentage variations over the comparable previous period. (iii) – means not available.

MRF

On a Roll

MRF is the market leader in the tyre industry. The company has done well for 1993-94 with the turnover increasing by 10 per cent (Rs 81.75 crore), operating profit by 10 per cent (Rs 9.72 crore) and net profit by 16 per cent (Rs 2.27 crore). Other income has fallen by 49 per cent (Rs 3.48 crore), non-operating surplus by 142 per cent (Rs 98 lakh), while interest charges have risen by 6 per cent (Rs 1.94 crore) and depreciation by 12 per cent (Rs 2.80 crore). Exports were down for the year by 21 per cent (Rs 20.95 crore), and imports by 4 per cent (Rs 4.39 crore). A dividend of 90 per cent was declared for the year. The debt-equity ratio fell marginally by 2 percentage points for the year, while short-term bank borrowings to inventories fell by 26 percentage points for the year. Sales to total assets and sales to gross fixed assets fell by 3 percentage points and 24 percentage points, respectively. Exports to sales was down by 4 percentage points while raw material consumption fell by 1 percentage point. Earning per share rose by Rs 5 from Rs 33 to Rs 38 for 1993-94. Gross saving to gross capital formation rose by 15 percentage points for the year.

The company has managed to maintain its leadership in the tyre segment and expects to further improve its performance. Its sale of tyres increased by Rs 93.29 crore and of automobile tubes by Rs 14.82 crore. MRF has also diversified into the manufacture of finished leather. Its soft touch leather products and Catzvelte range of leather garments which are exported to Norway, Sweden, UK and Germany are said to be well received. Exports have suffered because of diversion of products to the domestic market. The company bought the 9.08 per cent stake from Michelin of France, former collaborator, which had attempted a takeover when the latter disinvested in MRF. The company invested Rs 6.46 crore in its R and D activities.

PUNJAB TRACTORS

Indigenous Development

Promoted by Punjab State Industrial Development Corporation (PSIDC), Punjab Tractors was incorporated in 1970. PSIDC holds 24 per cent of the equity while mutual funds and financial institutions 40 per cent, FIIs 10 per cent, with 24 per cent of the equity being with the public. The company commenced its operations in 1974 based on indigenously developed technology. It has three divisions – tractors, combines and a foundry which are marketed under the brand name 'Swaraj'. Tractors account for 95 per cent of its aggregate turnover.

The company's turnover was up by 20 per cent (Rs 44.62 crore), operating profit by 26 per cent (Rs 7.08 crore) and net profit by 16 per cent (Rs 2.4 crore). Margins would have been higher but for the rise in taxation, interest charges and depreciation by Rs 3.5 crore, Rs 63 lakh and Rs 94 lakh, respectively. A dividend of 80 per cent was declared for the year. Exports rose sharply at Rs 5.3 crore as against Rs 1.05 crore in the past year. Imports fell to Rs 1.25 crore from Rs 2.17 crore in the previous year.

Debt-equity ratio has risen by 8 per cent, 9 per cent and 18 per cent in the past three years. Short-term bank borrowings fluctuated at 15 per cent, 8 per cent and 9 per cent for the same years. Sales to total assets fluctuated at 156 per cent, 174 per cent and 156 per cent, while sales to gross fixed assets rose at 288 per cent, 295 per cent and 303 per cent for 1991-92, 1992-93 and 1993-94. Inventories to sales showed a declining trend. Return on investment fluctuated at 16 per cent, 20 per cent and 19 per cent for the past three years. Earning per share fell by Rs 9 for 1992-93 and rose by Rs 2 for 1993-94. Remuneration to employees declined by 41 per cent, 35 per cent and 31 per cent in the three years.

The company has now moved into the third position in the industry. The sale of tractors remained high throughout the year with harvester combines and forklift trucks too doing well. Out-turn at the foundry grew by 3.3 per cent for the year. The company is expanding its capacity from 21,000 to 36,000 tractors per annum with a total outlay of Rs 25 crore which is to go on stream by the end of 1996. Having developed indigenous technology the company has restricted its foreign exchange outgo. The increase in sales is also attributed to its after sales support service. The company's R and D facilities expenditure was Rs 89 lakh.

BHARAT BIJLEE

Expanding Markets

For the past three years Bharat Bijlee which manufactures transformers, electric motors and lifts has shown a fall in profits. Though net sales were up at Rs 97.55 crore as against Rs 89.87 crore, operating profits fell to Rs 8.96 crore against Rs 10.09 crore in the previous year. Margins fell to Rs 1.8 crore as against Rs 2.70 crore in 1992-93. Though other income and non-operating profits rose, and interest charges as well as depreciation was low, margins declined. This fall has been attributed to the transport strike and the additional depreciation provision of Rs 51 lakh to write off assets of negotiable amounts. While imports rose sharply from Rs 5.39 crore to Rs 9.21 crore, exports fell to Rs 3.69 crore from Rs 4.27 crore. The company declared a dividend of 22 per cent for the year.

Return on investment declined in the past three years at 10 per cent, 7 per cent and 6 per cent. Net value addition to the value of production fell by 2 percentage points for 1992-93 and 1 percentage point for 1993-94. Remuneration to employees however, grew by 1 percentage point and 4 percentage points for the same period. Earning per share fell at Rs 219 in 1991-92, Rs 93 in 1992-93 and Rs 63 in 1993-94. Debt-equity ratio fluctuated at 50 per cent, 43 per cent and 45 per cent for the past three years. Short-term loans rose by 15 percentage points for 1992-93 and fell by 1 percentage points for 1993-94. Consumption of raw materials grew by 3 percentage points for 1992-93 and fell by 7 percentage points for 1993-94. Sales to total assets and sales to gross fixed assets grew in the past 3 years.

The sales of the motor division in terms of value and quantity grew for the year. The transformer division did well with high export orders being booked. The order booking of the lift division was satisfactory and the proportion of Olympus Schindler installations increased. The transformer division which makes both power and distribution transformers is the major contributor to its turnover. The division contributes around 50 per cent to the sales. The company has collaboration agreements with Siemens AG of Germany for the manufacture of transformers. The division also specialises in making electronic motors including standard motors up to 45 KW, flame proof motors and monobloc pumps and also custom engineered motors for specialised applications. Escalators are also being made in collaboration with Schindler of Switzerland. Marketed under the brand name Olympus Schindler they enjoy a 15 per cent market share.

With the power sector being opened up to private companies, investment in the sector is expected to shoot and so is the demand for the equipment. The company expects to do well in the next few years.

MYSORE CEMENTS

Power Shortages

Mysore Cements, a part of the S K Birla Group, has registered mixed performance for 1993-94 with an increase in sales by 8 per cent; operating profit fell by 16 per cent, and gross profit by 8 per cent, and net profit rose by 26 per cent. The rise in margins was due to the fall in interest charges by 15 per cent, depreciation by 25 per cent, and nil taxation. Other income fell by 12 per cent, while non-operating rose by 3 per cent. Exports were up by Rs 78 lakh, while imports fell by 8 per cent for the year. A dividend of 20 per cent was declared for the year. Debt-equity ratio fell by 34 percentage points, short-term bank borrowings fell by 1 percentage point for the year. While sales to total assets remained steady, sales to gross fixed assets rose by 1 percentage point for the year. Consumption of raw material fell for the year. Earning per share fell by Rs 2 per cent for the year. Remuneration to employees rose from 17 per cent in 1992-93 to 22 per cent in 1993-94.

The cement industry was dogged by short supply of coal, inadequate and erratic supply of power and non-availability of wagons. The company has managed to maintain its capacity utilisation at 103 per cent as against the all-India level of 86 per cent and the despatches also increased by 8 per cent. Increases in cost of cement production was due to the increase in the administered prices of inputs, like coal, fuel oil, freight and transport and power. Rights issue of FCDs aggregating Rs 113.38 crore was completed during the year. After the conversion of debentures the equity of the company increased to Rs 44.42 crore. The company as a part of its diversification has plans to set up a latex thread project in TIDCO at Hosur and in technical and financial collaboration with Polcon Italiana of Italy who are also to participate in the equity capital of the new company. The company has also decided to increase its own power generation capacity at all its units. A new cement plant has been set up at Damoh in Madhya Pradesh, with a 10 MW captive power plant for the Damoh unit and installed wagon tippler, coal stacker and coal washery for the one million tpa clinkerisation plant. The company has plans to diversify into pig iron, casting and structural fabrications, for which a new subsidiary is being set up. The first phase will comprise a three lakh tonne foundry grade pig iron plant at Haldia, at a cost of Rs 150 crore. In the second phase the pig iron capacity is to be expanded while it would also diversify into foundry-grade casting and structural fabrications at a cost of Rs 600 crore.

NARMADA CEMENTS

Rise in Exports

Narmada Cement Company, once a blue chip company, is now experiencing a decline in margins. Net sales of the company was up by 10 per cent for 1993-94. However, operating profits fell by 53 per cent and net profits by 332 per cent. Interest charges grew by 5 per cent for the year; other income was up by 38 per cent; depreciation was down by 68 per cent. Sluggish demand and subdued prices put heavy pressure on the company's margins. Exports were up at Rs 5.6 crore as against Rs 1.92 crore in 1992-93. Imports fell to Rs 78 lakh from Rs 90 lakh in the previous year.

The long-term borrowings of the company fell by 8 per cent for the year. Short-term borrowings fell from 24 per cent in 1992-93 to 15 per cent in 1993-94. Sales to total assets grew at 133 per cent and 163 per cent in the past two years. Sales to gross fixed assets grew at 104 per cent and 115 per cent for the same period. Return on investment fell by 13 percentage points for the year. Inventories to sales fell by 4 percentage points for the year; net value added to value of production fell by 8 percentage points. Remuneration to employees rose by 30 percentage points for the year.

Clinker production was at 7.89 lakh MT for the year. Despatches of cement in the domestic market during the year were at 6.38 lakh MT and realisation fell by Rs 29 per MT for the year. With the reduction of import duty on coal to 35 per cent from 85 per cent, indigenous coal has become expensive and hence the company is forced to import all its coal requirements. The company has plans to install new machinery and thus lower its operating costs.

Promoted by the Chowgules the company has been a BIFR case and it has prepared a Rs 90.09 crore draft scheme to tide the company over the situation. The scheme envisages a capital expenditure of Rs 28.59 crore and payment to financial institutions and banks of Rs 61.5 crore. The cost of this scheme is to met by promoters' contribution of Rs 61.5 crore and internal generations of Rs 28.59 crore. The net worth is expected to become positive from 1994-95 and the accumulated losses are likely to be cleared during 1996-97. These accumulated losses ate into the company's Rs 29 crore equity capital. The company expended around Rs 4.8 lakh on its R and D activities.

Right to Assembly

A G Noorani

The Supreme Court had ruled, 20 years ago, against arbitrary power to ban public meetings. Recent instances reveal that the judgment has had little impact on the minds of governments. A reminder from the Supreme Court is overdue.

THE Constitution of India guarantees to every citizen the fundamental right "to assemble peacefully and without arms" in Article 19(1)(b). But the exercise of the right seems to depend on the whim of the executive. The judiciary has been none too helpful in upholding the right, exceptions apart. The right is subject to any reasonable restrictions "imposed by the state in the interests of the sovereignty and integrity of India or public order" – and on no other ground. Even on the two stated grounds, the restrictions must be "reasonable".

Successive governors of the state of Jammu and Kashmir have confidently denied this right to the people of the valley. Even a religious procession on the 10th day of Mohurram (June 9) was broken up by the police in Srinagar. The chief minister of Uttar Pradesh, Mayawati, banned meetings and processions soon after assuming office but relented a few days later. She realised of course that such a blanket ban had no chance of survival in the courts. There is scope for judicial intervention in cases of bans for a term, but judicial intervention becomes infructuous and futile if the state imposes a ban on a particular meeting at the last moment.

On May 3, 1981, a meeting was to be held on the Chowpatty sands in Bombay to protest against the government of India's policy on Afghanistan. The government of Maharashtra banned it after dilly-dallying over the requisite permission. The organisers moved the High Court on May 2 when Justice M L Pendse gave a mandatory injunction to the state to grant the permission. The state appealed to a division bench. The appeal was all but finally heard when it was withdrawn. A central minister, Vasant Sathe, pompously declared in Srinagar that no one would be allowed to make assertions which went against the accepted national policy. Accepted by whom? Indira Gandhi, of course. He referred specifically to the proposed meeting in Bombay and said India did not want to get its relations with friendly countries spoiled by such meetings. He meant the friendly regime of Soviet-installed Babrak Karmal.

In 1991 the Madras High Court, on the petition of K Thiagarajan, struck down the order of the commissioner of police, Egmore, banning public meetings for 15 days. The petitioner had sought permission for a meeting to be held on September 27, 1991. Such bans were renewed as a matter of course. The court observed that "merely under a pretext or assumption that there would be a breach of peace or a law and order problem would be created, summary rejection of an application for the conduct of a meeting could not be permitted". It deprecated the practice of renewing such ban orders fortnightly.

In a later case, however, the high court imposed conditions before directing the police to accord the requisite permission. The prior conditions related to the content of the speeches – a form of pre-censorship. The meeting was to commemorate the death anniversary of Bhagat Singh. According to an article in *The Hindu* of May 3, 1992, the court directed that the meeting could be held only if the speakers gave an undertaking to speak only on Bhagat Singh and his policies and would not speak "anything about politics" and that "they would not make any statement or speech which would intimidate the general public of the locality or other parties".

The Supreme Court tripped in the leading case of Himatlal vs Police Commissioner, Ahmedabad. Chief Justice S M Sikri gratuitously and very wrongly observed that "we do not think that Article 19(1)(a) is attracted on the facts of the case". This provision embodies the guarantee of free speech. It is absurd to suggest that the guarantee of free speech is not 'attracted' if a public meeting is to be held. What else is the purpose of a meeting if not to express thoughts, feelings, opinions or emotions – by words, music or dance? Both rights are 'attracted' – the right to free speech and the right to assemble.

The Supreme Court, however, ruled against arbitrary power to ban public meetings. That was 20 years ago. In the light of experience the ambit of direction which the court granted to the executive must be more narrowly defined.

The observations by justice K K Mathew in his concurring judgment have been quoted in support of the citizen's rights. He said:

> public meeting in open spaces and public streets forms part of the tradition of our national life. In the pre-independence days such meetings have been held on open space and public streets and the people have come to regard it as a part of their privileges and immunities.

The state and the local authority have a virtual monopoly of every open space at which an outdoor meeting can be held. If therefore the state or municipality can constitutionally close both its streets and its parks entirely to public meetings, the practical result would be that it would be impossible to hold any open-air meetings in any large city... The conferment of a fundamental right of public assembly would have been an exercise in futility, if the government and the local authorities could legally close all the normal places where alone the vast majority of the people could exercise the right.

The state possesses the power of 'reasonable regulation' but not of 'arbitrary exclusion'. The power to decide whether a meeting should be permitted or not cannot be conferred on a state official without laying down precisely the criteria he should observe. The Supreme Court approvingly recalled in this context the dicta of the US Supreme Court that the conferment of "such broad discretion in a public official allows him to determine which expressions of view will be permitted and which will not. This thus sanctions a device for the suppression of the communication of ideas and permits the official to act as a censor".

Recent instances reveal that the judgment has had little impact on the minds of governments. A reminder from the Supreme Court is overdue.

Institute of Chinese Studies

Centre for the Study of Developing Societies
9 Bhagwandass Road, Second Floor
New Delhi – 110001
Tel: 388155
Fax: 001-2923059

RESEARCH PERSONNEL NEEDED

The Institute of Chinese Studies is a national forum of serious research on China, founded jointly by scholars from the various academic institutions of Delhi as a unit of the Centre for the Study of Developing Societies. It publishes the reputed quarterly journal **China Report.**

The ICS is currently engaged in an inter-disciplinary research project on "China: Into the 21st Century" for which it requires short-term/long-term research staff. It invites applications from persons with a good Master's Degree and particularly welcomes candidates trained in Chinese language and/or Chinese Studies. The Institute provides excellent opportunities to those seeking a career in Chinese Studies. They will work with well known scholars in the field and have access to the necessary research materials at the ICS library.

Appointments as Research Associates/Assistants, to begin with, will be *ad hoc* and temporary, part-time or full-time. Remuneration will be decided according to the qualifications of the candidates and will ordinarily range between Rs 1500 and Rs 2000 for part-time and Rs 3000 to Rs 5000 for full-time staff.

Applications with full particulars including names of two referees should reach the Institute by 1 August 1995. Those wanting to pursue a career in Chinese Studies should append a short statement of about 250 words on the area of their interest. Interviews will take place on Saturday, 5 August 1995 at the premises of the Institute of Chinese Studies, ISIL Building, 9 Bhagwandass Road, New Delhi - 110001. To minimise waiting time, candidates with surnames A to K will be interviewed between 10 a.m. and 1 p.m. and the rest from 2 p.m. onwards.

The ICS is compiling a Directory of Indian scholars and institutions with interest in Chinese Studies (including Language). Those engaged in teaching/research on China are requested to send their particulars for inclusion in this Directory by 1 September 1995.

Those involved in research on contemporary China are invited to send details of their research and publications to the ICS which encourages collaboration with scholars all over the country.

Administrative Officer

Women's Struggle for Production of Life

Public Hearings of Women Workers in Informal Sector

Gabriele Dietrich

There is a growing tendency to focus on violence against women and on cultural deprivation. While this in itself is very important, it is often not clear, how this can go beyond seeing women as mere victims and how it relates to the work sphere. The recent public hearings, one on the entire informal sector in Tamil Nadu and another on women employed at all levels in the fishing industry, enable an understanding of women's social agency in the sphere of production and to identify how production relations need to be transformed.

WE are living at a point in the history of our nation where everything seems to be in flux. Under the impact of the NEP, the public sector of the economy is shrinking, the private sector takes to more ruthless forms of profiteering and the informal sector, covering already over 90 per cent of the economy, keeps expanding. Obviously, under such conditions, the vast number of women, more than 50 per cent in the sector, are increasingly under duress. As the government, under the pressure of multinationals, IMF and WTO is increasingly abdicating social responsibility public hearings become a device to make the voice of these voiceless women heard all the same. It is a sector in which employment-employer relationships can often not be pinpointed, and whom to make answerable and how appears a hazy question. It is only due to the enormous efforts of labour organisations in the informal sector that the situation of such women becomes visible at all. This trend is in marked contrast to all sorts of efforts of the government to co-opt women into its policies by giving them space in Mahila Samakya programmes in different states and offering feminists in NGOs an apparent shortcut to mass work.

There are many discrepancies in how women's situation is analysed. There is a growing tendency to focus on violence against women and on cultural deprivation. While this in itself is very important, it is often not clear, how this can go beyond seeing women as mere victims and how it relates to the work sphere. Side by side, there is another emphasis, especially among NGOs to focus on income generation without clarifying how this relates to the overall changes in economic policies. The hearings in the informal sector enable us to understand women's social agency in the sphere of production and to identify how production relations need to be transformed.

Looking at the informal sector, the extent to which the government disowns social responsibility becomes more easily visible. But obviously, there are also contradictions within the state as we can see committed judges siding with the poor in the attempt to make the government answerable. At the same time it is obvious that the transformation of the sector which is needed cannot be carried out by legal means only, but must involve a process of comprehensive reorganisation of society in which trade unions, women's and ecology movements, political parties and all democratically minded forces must join together. We need to understand the complexity of the informal sector and evolve new mechanisms of redressal, procedures of implementation of laws, forms of organisation, as well as a new jurisprudence which will be able to strengthen the overall struggle for transformation. This will enable the most disadvantaged sections of the working class to become visible as social agents.

On June 23-24 a public hearing on women's struggles for survival in fisheries was held by the National Fishworkers Forum in Mas Hotel Auditorium, Ernakulam. This in itself was a historical step as it was the outcome of over 15 years of struggle to make women visible within the sector. The fishing communities in the marine sector comprises of 75 lakhs, nearly half of these women and of course there are many inland fishing communities as well. While women in India do not go to sea, in some parts they do inherit fishing gears and are owners of the catch. Some women in Visakhapatnam advance running capital for trawlers. Women also dive for pearls and catch cockles and shrimps with their fingers in inland fisheries. They have been traditionally involved in the preservation and marketing of fish and in net-making. All this has been impacted by the intrution of increased mechanisation in the sector, depletion of fish resource due to trawling, increased export orientation and preservation and marketing being more and more taken over by men.

The present major battle of the sector as a whole is the fierce struggle against licensing of foreign vessels which culminated in a hunger fast of NFF chairperson Tom Kocherry at Porbandar, supported by a simultaneous struggle in New Delhi to compel parliament to take notice. However, the promise of the minister of food processing industries to review the terms of reference of the committee concerned with the issue given on May 18, has not been kept. The National Fisheries Action Committee on June 26 had to decide to begin a protracted struggle and has announced the blocking of important ports for November 23, including Kandla, Bombay, Goa, Mangalore, Kochi, Tutukudi and Paradip (*The Hindu*, Ernakulam edition, June 27). Under conditions like these where the survival of the whole artisanal sector is at stake, who will listen to the women within the sector?

Yet, women raised their voice in painful clarity. The effort was supported very actively by the NFF chairperson Tom Kocherry and general secretary Harekrishna Debnath, but organisational efforts of women, both in the unions, in the PCO centre and in different women's organisations as well has been enormous.

The first day was devoted to a hearing in front of Justice Krishna Iyer, Justice Janakiamma and advocates Nandita Haksar and Indira Jaisingh. This hearing highlighted mainly the lot of the about 30,000 women fishworkers who migrate from Kerala to other maritime states in order to work in the prawn peeling sheds. They are young women between 16 and 25 years who are sold into virtual bondage by contractors and spend their lives under unbelievably inhuman conditions with 12-15 hours of work and totally inadequate housing and sanitation. Six women from Kerala and Tamil Nadu had been chosen to give their testimony, representing the plight of thousands of others. Aleyamma Vijayan, who had studied the sector in depth on behalf of the women's programme of the International Collective in support of fishworkers (ICSF) supplemented important information on the overall situation. The women earn between Rs 800 and 1,100 a month, though invariably at least Rs 1,200 is promised to them. Food expenses of Rs 250-300 will be deducted. Medical expenses are borne by the workers and are very high. They suffer many injuries and infections due to handling frozen prawns, working in damp conditions, slipping on water and ice. They live, 30 to 50 people in one room, with only two or three latrines and have to take baths in bunches of four or five in order to make it to work on time. There is no recreation and even if close relatives die, they are not

Tata Institute of Social Sciences Library

informed and do not get leave. Sexual harassment seems to occur but is difficult to voice as fear rules. Possibilities of labour organisation are extremely difficult as the girls are cooped up with each other and with the contractor who handles the money and controls their life.

The jury interrogated the girls about the method of recruitment and contracting and a major debate later arose on how this phenomenon can be controlled. The district labour officer of Ernakulam, while highlighting all the legal provisions in Factories Act, Casual Temporary Workers Act, Industrial Disputes Act, etc, also admitted that the government had no hold over the contractors. He admitted that not a single contractor had been registered but held the ignorance of the workers responsible for this. He promised to bring the matter to the notice of the labour commissioner. Albertina Almeida of Bailancho Saad, a women's organisation in Goa involved in the issue, explained about the difficulty to organisationally intervene as it was not clear whether to unionise or whether to have the women declared as bonded labourers and work towards getting them released. She also reported severe harassment of unionising attempts, including the death of a unionist's child under suspicious circumstances.

At the end of the day, the jury gave a very spirited judgment acknowledging the totally inhuman conditions in the sector and certifying violation of (1) Contract Labour (Regulation and Abolition Act of 1970); (2) Inter State Migrant Workmen (Regulation and Employment Act 1979); (3) Bonded Labour (Abolition) Act 1976; (4) Minimum Wages Act 1948; (5) Factories Act; and (6) ESI Act. They also pointed out violation of fundamental rights guaranteed in the Constitution of India like right to equality (Article 14), Right to Life (Article 19(1) and 21), prohibition of trafficking in labour and forced labour (Article 23). and several others. They simultaneously pinpointed the violation of the Universal Declaration of Human Rights and of convention 122 of the ICO and Declaration on the Right to Development of 1986.

They concluded that the government does not seem to have the will to enforce the labour laws. The Marine Products Export Development Authority (MPEDA) has not a single labour representative. The jury recommended the strengthening of international solidarity, referring to the participation of organisations from Senegal and Canada. It urged the government of India to take steps to ensure natural resources for the country and for a human-centred development based on self-reliance. It called upon the state governments to implement the labour laws.

The jury acknowledged that the problem will not be solved with such a judgment as the New World Order under the World Trade Organisation does not allow implementation of such recommendations. The jury concluded emphatically: "We have to commit ourselves to a long struggle so that world production systems based on production for life, not production for profit are evolved. We have to evolve a jurisprudence which is based on the belief that each human being is a priceless asset. We need to develop a resurgent jurisprudence to protect workers from exploitation so that we never have to hear such painful testimonies again. This new jurisprudence will help to convert the pain of these women to power – power to fight this unjust system."

Struggle of Fisherwomen

It was, therefore, only too apt that the second day of the hearing was devoted to the struggle of fisherwomen. Nalini Nayak, a member of NFF who works with the women programme of the ICSF gave the background of women in vending, net making, fish drying, cockle picking and subsequently women representing these different occupations spoke out. If the first day been emotional for the agonised outcry of very young girls, the second day was moving as it showed the survival struggle of elderly women, often widowed or deserted, fighting with lack of credit, lack of transport, local goondas and tax collectors in the market place. This gets aggravated by diminishing catch, longer travel, internationalisation of the trade, enhanced competition and violence. On top of it all, the living conditions in the coastal villages and urban slums inhabited by fishworkers, are totally crammed, lacking security and even water or toilet facility. In Ernakulam, women have to defecate in plastic bags and throw it into the river. They do this in public and during monsoon the excrement floats back due to flooding. All this meets with total apathy from the administration. Some women also touched upon the drinking habits of men, the violence, and the oppressive role of the church, especially the priests. Even where unionisation takes place, women do not get representation in the local committees as was reported from Kanyakumari. Dowry is another problem weighing on the women of the community heavily.

Aissatou Fay, and Amadou Wade from Senegal highlighted the situation in their countries and Chantal from Canada Maritime Fishworkers Union and Oxfam pointed out that Canadian fisherwomen would never have the guts to speak out in front of the mike with the boldness of the Indian fisherwomen.

A panel consisting of Vivekanandan of South Indian Federation of Fishermen Societies (SIFFS), Ruth Manorama of Women's Voice, Bangalore and Gabriele Dietrich, Pennurimai Iyakkam (Movement for Women's Rights) Tamil Nadu concluded the day with their responses. While Vivekanandan systematised the issues brought forward, Ruth Manorama blamed the government for its apathy and encouraged the unorganised sector to put up a chart of demands for struggle.

The hearing was summed up in three points:

(1) It was a historical event which had made women in the sector fully visible for the first time. It had also revealed all the ramifications of the sector from the local economic and socio-cultural level to the state and national as well as international levels. To make the connections conceptually and in the struggle is a crucial task.

(2) It is necessary to understand the connection between the village situation in which young girls are oppressed by family and church and day to day life world and get sold by contractors and the abysmal conditions in the far away peeling sheds. The girls are not uprooted. They wish to relate to the home situation, they want to sustain it, they do not just want to make a fast buck. It is this solidarity which forces them into exploitation. How can this cultural strength of solidarity be converted to a powerful transformative force? This will not only depend on unionisation only. It will also depend on how the movement can address the socio-cultural problems and help to transform the life world, cherishing and reconsrtructing socio-cultural traditions and identities and defending them against the onslaught of disintegration while at the same time curtailing their exploitative and oppressive contents.

(3) How do we work, at all organisational levels, for transformation of society towards production of life instead of production for profit.

Another historical process of women in the informal sector took place in Tamilnadu from the end of last year onwards and culminated in a series of co-ordinated struggles on March 8, International Working Women's Day. The struggle on March 8 saw over 500 women workers demonstrating before Labour Statue on Marina Beach, organised by Tamil Nadu Women's Labour Co-ordination Committee (TNWLCC) under the leadership of R Gita of Construction Workers Panchayat Union. In Madurai 200 women demonstrated, led by TNWLCC and Pennurimai Iyakkam, representing construction workers, weavers, agricultural labourers, domestic workers and slum dwellers. In Nagapattinam, construction workers were joined by weavers and beedi workers, while in Tuticorin, the demonstration was not allowed, but people met the collector. The demonstrations called on the Tamil Nadu state government to act on the recently released rulings and recommendations by Justice V R Krishna

Iyer and Krishnaswami Reddiar on illegal and exploitative working conditions of women in the unorganised sector. Failing response, protracted struggle would need to be resorted to. At present, preparations for protracted statewide campaign are in preparation.

This was the outcome of a public enquiry held in Madras under the auspices of the National Commission for Women (NCW) and organised by Centre for Labour Education and Development (CLEAD) on December 14 and 15, 1994. The findings were submitted to parliament in early February. This process in Tamil Nadu is not entirely comparable to the fishworkers hearing in Ernakulam as the NFF made an attempt to make visible the situation of women in one particular sector, from the village to the state, national and international level. The process in Tamil Nadu was an inquiry into the situation of women in many different parts of the informal sector over a large number of districts. The emerging picture is therefore far less homogeneous. However, both these approaches and methodologies are revealing in their own ways as the one reveals the logic of a sector while the other one reveals the condition of women in the informal sector of a whole state. These have different political implications.

Unsafe, Unhealthy, Ill-Paid

The public enquiry itself was preceded by local meetings with women labourers. After this search conferences in Madras (November 4-7, 1994), Nagapattinam (November 13-16), Tuticorin (November 13-20) and Madurai (November 22-23) took place. In these search conferences, women workers represented the problems in building constructions, agriculture, beedi, cigar, handloom, fishing, palm products, match industries, contract labour and domestic work. Gypsies making bead necklaces also participated. Such wideranging participation was brought about by the arduous travel schedules in a large number of districts like Madras, Chengai MGR, Nagapattinam, Tanjore, Madurai, Pasumpon, Trichy, VOC, Nella Kattabomman covering rural and urban areas.

The search conferences revealed conditions of poverty and vulnerability of women in the unorganised sector in its detail and hardly any support system except workers' organisation. Women labourers according to the 1991 Census numbered nearly 78 lakhs in Tamil Nadu. Their work participation was rated to be 35.7 per cent. Majority of women are classified as marginal workers under census definition because of the irregular nature of their employment. Some laws such as the Minimum Wages Act which has the provision for a wage-slip, the Contract Labour Act which stipulates provision for identity card, or Beedi and Cigar Workers Act that has provision for pass-book have been hardly implemented or blatantly violated in the case of women labourers, making them invisible. Hard labour of women in vital sectors such as construction, agriculture and handloom, too, are invisible in the records. Invisibility in the sectors such as domestic workers are supported by law. The family incomes of the women in the unorganised sector range from Rs 400 to Rs 600 per month. As the official poverty line is set at Rs 16,000 per year, women in the unorganised sector who earn yearly incomes at less than half the poverty lines are some of the most vulnerable of the working poor.

One can appreciate the process of the search conferences only if one keeps in mind that the women had to leave their families and their work behind for several days and travel large distances. However, they did so with great enthusiasm and not only shared each other's lives but were vying with each other to speak out and to put their experiences into songs and skits as well, which emboldened them to prepare for the ensuing struggles.

It is extremely difficult to highlight the different aspects which come out of the search conferences as the different subsectors are by no means homogeneous and there are also variations between districts. Unlike the hearing on the fisheries sector, where connections within one sector from local to international level can be made, the search conferences presented a patchwork of conditions and issues from which it is difficult to generalise and to make connections between the subsectors. This only shows the enormous efforts needed to bring all these women together. Some general observations can be made.

Employment is non-regular leading to underemployment varying from 100-150 days (agriculture) to 250 days (construction, weaving, beedi, match). All home-based production is affected during monsoon. There is no scheme for provision for the period of non-employment. Work security is nil as even work records are mostly non-existing. Indebtedness and conditions of near-bondage abound. Even public sector establishments such as Madras Port Trust and Basin Bridge Power House failed to regularise women contract labourers and to give them job security. Prawn farming which is fast spreading out, receiving government subsidies under the New Economic Policy, affects women's employment in agriculture and in fishing in addition to affecting rural ecology adversely.

In all the different subsectors women receive wages which are lower than that of men. Women's work is undervalued not only in social practice but also in government policy. Minimum wages fixed by the government undervalue women's work and are discriminatory. What is fixed, sometimes, as minimum wage in home-based sectors such as handloom, match, beedi and cigar is actually family income (because of family labour) and not the individual's wage. For sectors such as domestic work, beads making and dry fish and palm product activities the minimum wage is not fixed. The minimum wage and equal wage violations are rampant in all sectors and there is no effective method for implementation. Unless there is proof and regulation of employment and women labour's participation in implementation ensured by law, the law on minimum wages and equal remuneration cannot work.

As in the fisheries sector, the living conditions of the workers in the other subsectors are equally insecure and water as well as other basic amenities are virtually absent. Recently in Madras, Slum Board tenements in which some of the workers live, collapsed over their heads leading to loss of life. In the name of flood prevention, rampant evictions have taken place in Madurai under World Bank Scheme which leads not only to loss of housing but also to loss of livelihood as the workers are not allotted alternative accommodation close to the place of work, in blatant violation of WB rules.

It was most heart-rending in all of these workshops to hear of the tragedy of children of workers in the unorganised sector. In the absence of creche facilities they are looked after by siblings which leads to loss of schooling especially among girl children. Bondage perpetuates itself. Low wages and absence of social security benefits in themselves force families to promote the exploitation of their own offspring. The welfare fund providing scholarships for beedi workers children has a stipulation of 45 per cent minimum marks. Rather than serving as an incentive to eliminate child labour and encourage compulsory education, such rules exclude children from educational opportunities.

The whole unorganised sector is plagued by lack of safety and people are incapacitated and maimed by accidents all the time. No binding safety norms exist. Compensation as per Workmen's Compensation Act could be secured only where unions have fought to establish the accidents. Accidents faced by domestic workers are not covered by the Workmen's Compensation Act. The long legal process and appeals are unsuitable for unorganised labour since they are in a vulnerable situation. The Accident Relief Scheme of the Tamil Nadu government for agriculture and construction workers produces inordinate delays and corruption as it is routed through revenue department.

Insecurity marks the situation literally from the cradle to the grave, and more so during child bearing in-between. There is a lack of social security such as Provident Fund, Maternity Benefit and Pension.

Implementation of PF in beedi and cigar industries is full of problems involving non-remittance by the employer or closure of accounts by lump sum payment. Later, the lump sum is collected and PF accounts started in false names. Since there is no maternity benefit women worked till the day of delivery and had to become indebted due to medical and food expenses. The Tamil Nadu government scheme is hardly a substitute since 50 per cent of the money is lost in bribes and the other half in loss of wage while running around for that. It was suggested to extend Employees State Insurance (ESI) as a workable alternative. Without the pension provisions women have to work till they became infirm. The existing Old Age Pension of the state government that provides Rs 75 p m and 1 kilo of rice p m and two sarees a year is inadequate. Raising the money to Rs 300 a month and supplementing it by the pension scheme for the unorganised sector could be a helpful policy.

In the different search conference workshops, land encroachment and land-alienation became visible as a factor adversely affecting workers in the informal sector. Even common lands are illegally occupied by politically influential persons. Some concrete instances were documented like, the closing of a public pond in Jaladhampet in Chengai MGR district, encroachment of grazing land, common land and even the main roads by landlords in the Irular village of Gandhigram in Tiruvallur taluk of Chengai district, false promises of 'pattas' for mobilising people to attend the chief ministers' function in Nagapattinam, police firing killing two persons and filing of false cases on dalit women and men when they reclaimed 650 acres allotted to them during the 1930s in Karanai, Chengai MGR district. It was felt that land distribution to women in the informal sector should become a top priority if basic constitutional rights are to be implemented.

There were also animated discussions on alcoholism of men and the family violence going with it. Demand for total prohibition of liquor was voiced in all the workshops. Under the slogan 'food instead of liquor', the demand for prohibition got connected with the demand to strengthen the public distribution system (PDS) and to enforce price controls and proper quantities like 30 kg of rice and 15 litres of kerosene a month. Distribution hours also need to be adjusted with working hours.

Jayanthi Patnaik, the chairperson of the National Commission for Women, referred largely to the same labour laws which came up in the fish workers hearing mentioned above and commented that the schemes of the Tamil Nadu Manual Workers Act which is in itself a good state law covering the unorganised sector, only covers the three districts of Madras, Kovai and Madurai, apart from leaving out vital issues of employment and social security.

Padma Seth, another member of the commission, explaining the format of the public inquiry, called upon the government officials to take this opportunity to understand the complexity of the problems which will help in evolving long range policy formulations. Justice V R Krishna Iyer in his inaugural address reaffirmed that payment of minimum wages, employment security, a work environment free of gender-based discrimination, laws to ensure personal protection and social security were inviolable and basic rights of women workers. He expressed the belief that the public inquiry, which brought together the state government officials and workers under the supervision of the National Commission for Women, would be a new method of putting democratic presssure to enforce the legitimate needs of the workers and to create a new mechanism of implementation that would give women workers the confidence that legislation works.

As far as answerability of government officials was concerned, the picture was rather bleak. The behaviour of S S Sharma, the director general of labour welfare from New Delhi appeared fairly symbolic. He refused to talk into the mike and gave answers only to the commission, consistently turning his back to the people. Challenged on this by the audience he replied he was answerable to the commission only, not to the people. The women unanimously refuted the claims of director of the state social welfare board K Deenadayalan on the functioning of welfare schemes. Even in the slums opposite Fort St George, they pointed out, children did not benefit from the noon meal scheme.

Justice V R Krishna Iyer concluded that neither the present system of legal adjudication nor any new system of a departmental body will help to permanently solve their problems. The legal bench ruled. There is need for establishment of a mechanism such as tripartite board (government employers and workers) all over Tamil Nadu to address to the demands of men and women construction workers and to regularise the industry. The mechanism should take care of ensuring regularity of employment, enforcement of minimum wage, removal of all forms of discrimination and workplace safety.

Recommendations included a need for central legislation on construction labour. Implementation of Tamil Nadu Manual Workers Act extending it beyond Madras, Madurai and Coimbatore to all areas in the state, and to ensure proportional representation of women in the board. Collecting 2 per cent over estimated construction cost as a levy, payment of monsoon allowance to workers, provision for skill training programmes for women and employment for skilled women workers, regularisation of slums and provision of basic amenities to workers constitute some of the crucial recommendations.

There were rulings on all the different sectors addressing all the concerns brought forward during the different workshops like regularisation of maternity benefits and re-fixing of minimum wages in the different industries, especially beedi, regularisation of contract labour. The ruling on domestic labour did not recommend their inclusion under Tamil Nadu Manual Labourers Act as their organisation had demanded. This apparently had to do with reluctance of the commission members to apply labour laws to women who do labour in their own households. The model of the tripartite board for regularisation of employment and wages as envisaged in the Construction Workers Bill and in the struggle for national legislation on construction labour, remains an important model for other parts of the sector as well and will hold the key for implementation of social security, safety, permanency of work and all other benefits. One of the most important rulings was on the extremely damaging effects of prawn farming with respect to women's employment and destruction of soils. Justice V R Krishna Iyer challenged the scientific community which claims to develop means of cultivating prawn in non-arable land to develop means of making land useful for agricultural production, geared to local needs.

The search conferences in Tamil Nadu and the hearing in Madras, including the struggles on March 8, have given an emphatic picture of women emerging on the public platform in the informal sector. The emergence of National Centre for Labour (NCL), a national outfit of unions in the informal sector together with working class women's movements and other supporting organisations in Bangalore on May 28 in a massive rally, was an important step in trying to unite the sector. The struggle can only pick up if it does succeed in connecting all the local levels to state and national issues and to the entire international dimension. Women in the forefront of this struggle indeed mean the focus to be on the right to life and livelihood and the concerted attempt is to break down the hegemonic development model based on profit and the power of the market.

[Writing this article would not have been possible without the organisational efforts and recording work of large number of people. I cannot name them all but would like to mention Aleyamma Vijayan, Nalini Nayak, Mercy Alexander, Aparna Sunder, Gita Ramakrishnan, Kamala Visveshwaran, Agila Sivandan, E Siddhamma, David Rajendran and of course the large number of women workers giving their testimony as well as the judges, lawyers and commission members involved.]

Disillusionment of the Displaced

S Srinivasan

Just about a year ago oustees of the Sardar Sarovar Project were forcibly evicted and transported to new sites. Today, disgusted with the lack of facilities, they have begun to return to their original villages or places close by. The trickle of returnees may well turn into a flood.

LESS than an hour's drive from the boom town of Baroda, Gujarat's so-called cultural capital, are situated a majority of the resettlement sites of the Sardar Sarovar Project on the Narmada. Oustees from Gujarat's 19 submergence villages, and those displaced from Maharashtra and M P are resettled at these sites. The inhabitants at these sites, especially the Gujarat oustees, were promised alternative benefits under the Gujarat government's Resettlement and Rehabilitation (R and R) policy, and in persuading these oustees to shift from their ancestral homes near the Narmada, not a small part was played by two of the prominent NGOs of Gujarat.

But now it is increasingly becoming clear that these oustees were resettled, relocated and dumped but not rehabilitated. Over the last few years, there has been a trickle of oustees going back to their original villages from the resettlement sites, disillusioned and disenchanted with the lack of facilities to carry on their lives. This summer the trickle threatens to be a steady stream. In May 1995 about eight families from Malu resettlement site returned to Gadher, a declared submergence site. Then on June 8, 1995 a total of 22 families (numbering 114 persons in all) returned from Malu to Gadher. About the same time, 34 families from Karmaliyapura resettlement site have gone back to Suka, Vagrali and Kareli, villages near their old village of Panchmoli which is now dyke-filled. In village Mukhdi, there are now two families back from Ambawadi resettlement site.

For those returning from Malu on June 8-9 the event was marked by a show of strength by the government. These 22 families had hired six trucks, at anything between Rs 800 to 1,600 per truck per day, had dumped all their household goods in the trucks and were about to leave. The trucks with the goods of those waiting to return to Gadher were seized and not allowed to leave Malu resettlement site. Police and the resettlement authorities saw to that. There were arguments and altercations. The oustees decided to walk all the way back to their original village of Gadher without their household goods. When we met them on June 24 at Gadher, they had built two makeshift houses covered with tarpaulin and leaves of teak trees. Their goods were still impounded at Malu and life at Gadher was being carried on with vessels, clothing and grains borrowed from nearby villages. Later in the day we met about 40 oustee representatives from Ambawadi, Piparvati, Lotiya, Parsa and other resettlement sites. All of them felt they had come to the end of their tether and would like to return to their original villages.

In almost all cases, oustees said they want to return to their original villages for one or more of the following reasons: the allotted land at the new site was barren, fallow, disputed, fragmented and/or encumbered; the water was brackish and/or saline and unsuitable for humans, cattle and irrigation, and inadequate or no water sources for cultivation in non-monsoon months. Other aggravating factors have included, hostility of nearby villages, living day and night in inhospitable tin sheds, lack of grazing and fodder facilities for cattle, waterlogging, poor yields from land; lack of safety for women, cultural alienation, difficulties in making a transition from a relatively non-monetised economy to a market economy. Many of the oustees at Malu, Ambawadi, Piparvati and other sites frequently had to do wage-labour ('majoori') to supplement their livelihood. This was in marked contrast to working on one's own land in their original villages where they felt their lives were far more self-reliant and self-sufficient.

During March a People's Union for Civil Liberation (PUCL) team from Baroda visited resettlement sites in Baroda, Panchmahals and Bharuch districts. The team found oustees from M P from the following resettlement sites had returned *en masse*, in many cases entire sites were vacant (but for the watchmen on government payroll): Rajnagar, Jaipura, Koba, Kachota, Miyagam, Bakrol, Lotana. The report of the committee of MLAs of MP under the chairmanship of Singhdeo, which visited the sites earlier (December last), also speaks of the significant return of oustees back to MP because of inhuman/inhospitable conditions at the resettlement sites. One unofficial estimate puts the figure at 328 families as having returned to MP out of the 1,044 families that had come to Gujarat. (Official figures of course paint a rosy picture. It should also be mentione here that ultimately 50 per cent of the 33,014 affected families from MP are expected to settle in Gujarat).

As the PUCL report says,

> Human rights are violated at every stage of the process in shifting, in the so-called resettlement and in the awarding of inadequate and/or no compensation and the inability of the affected persons to live in accordance with their preferences and with their dignity and self-worth intact.

> **Article 21 of the Constitution has been interpreted by the Supreme Court in Olga Tellis vs BMC, 1985, as guaranteeing the right to livelihood apart from meaning the right to live with dignity. Article 39 and the Preamble repeatedly emphasise the value of the dignity of the individual. Again, Article 19 (1) (e) guarantees the right to reside and settle anywhere in the country. Also a whole host of directive principles, exhort the state to take a series of serious actions to create conditions so that individuals can have adequate means to livelihood, the state is expected to render assistance in cases of undeserved want.**

That these problems have occurred because of callousness, indifference and negligence of the R and R implementation officials is clear. This fact has now been formally acknowledged by a prominent pro-dam NGO, ARCH-Vahini. In a circular dated June 12 the latter has come out strongly against Rajagopalan, the chief executive of the Narmada Rehabilitation Agency. Ironically the NGO in the letter now speaks of threats it received by the government, questioning its loyalty to the dam and to get co-opted 'or else'. According to the NGO, the rehabilitation officials spoke of the inevitability of corruption in such a massive R and R effort. This is no news for oustees. Many of them have had firsthand experience. That the main responsible R and R authority is saying this is probably news.

The more basic issue is whether equitable rehabilitation is possible at all when displacement takes place on such a large scale. As the PUCL report says, "If one considers in addition the cultural deprivation of the community, the uprootment, the alienation, the change of lifestyles, and the fragmentation of their communities, it is impossible for oustees to restore their lives to their previous equilibrium".

Visible evidence that the oustees are fast losing patience, if any were required, comes in the form of two recent incidents involving oustees and officials. On June 17 at Ambawadi resettlement site (near Dediapada) oustees assaulted ('slapped' according to one version) the assistant commissioner in charge of R and R of Gujarat oustees as also the deputy collector Sangada and the chief engineer. On June 28 oustees at Dharampuri resettlement site near Dabhoi seized the jeep of an official angered by his inability to get their water problems solved. Almost a year ago on June 24, the homes of these oustees in their original village of Vadgam (near the dam site) were brought down forcibly with the help of a sizeable contingent of SRP and officials, their goods packed in trucks and dumped at Dharampuri in pouring rain.

It is this drama of shattering the psyches of dignified, self-respecting people with means, of fragmenting and dispersing their communities, and of eventually pauperising and immiserising entire self-reliant communities that has continuously characterised the resettlement process of the Sardar Sarovar Project.

On 'Bombay'

Asghar Ali Engineer

The controversial film 'Bombay' is a curious mixture of realism and fantasy, although it does make an attempt to reduce the gulf between two communities.

TWO important points emerge in the controversy around Mani Ratnam's film on Bombay riots one is political and the other pertains to artistic freedom

In fact the film has been facing politicians' ire in almost all the states where it is slated for exhibition It ran into rough weather in Tamil Nadu, Andhra Pradesh, Karnataka and later in Bombay The first objection to it was raised by the Shiv Sena chief Bal Thackeray He wanted some of the dialogues spoken by the actor Tinnu Anand (playing Bal Thackeray in the film) deleted The dialogue in question was about wiping out a particular community which according to Anand "are a direct lift from Thackeray's speeches There is not a single dishonest statement including the full stop or a comma" Mani Ratnam, the director, however, agreed, under pressure to remove this part of the dialogue The other condition for allowing the film to be released in Maharashtra was that its title should be changed to 'Mumbai' instead of 'Bombay' as originally planned First, there was news in the papers that Ratnam has agreed to rename the film as 'Mumbai'; but later on it was made clear by the director that he was not going to change the name

Thereafter the elections in Maharashtra came in the way The Pawar government was not ready to release the film on account of its sensitivity The film was also previewed in the city by top police and home officials and the decision was left to the government of Maharashtra Pawar did not give his nod until elections were over At that time the commissioner of police, Satish Sawhney, also was of the opinion that the film was not fit for public viewing and that its exhibition involved risk, he maintained. The inspector general of intelligence bureau K K Kashyap gave a very honest assessment after viewing the film "The film is very powerful", he said "If you have had some formal education, you can take it in your stride while those deep into fundamentalism might misinterpret it Certain symbolic aspects can be misinterpreted because you cannot control sensitive minds", he said In fact what Kashyap said has proved to be prophetic All sorts of fundamentalists attacked the film subsequently The film was fiercely opposed in Andhra Pradesh too, particularly in Hyderabad, when it was to be released The Majlis Ittehad-ul-Muslimin leaders threatened to stop its exhibition if it was allowed to be shown in Hyderabad and other parts of Andhra Their objection was that a Muslim girl has been shown falling in love with a Hindu boy The commissioner of police, Hyderabad, V Appa Rao, also had to suspend its exhibition for the time being after an incident of vandalism in a theatre in Yadagiri

The film later faced the same fate in Bombay A section of Muslims began to object to its exhibition on various grounds A special screening was arranged for Muslim leaders They were local leaders representing municipal wards They raised several objections Some of them said the film shows that the Hindu boy takes a Muslim girl when she is holding a copy of the holy Quran Some one said that when the girl goes with the Hindu boy, a verse from the Quran is being recited It will injure religious feelings of Muslims Suhail Lokhandwala, a municipal corporator maintained that it would spoil the atmosphere as it would remind many Muslims of their near and dear ones who had been victims A delegation of Muslims also met the chief minister Manohar Joshi to plead with him to disallow the exhibition of the film. Subsequently the commissioner of police suspended the exhibition of the film by one week The commissioner was right in postponing its exhibition in view of the law and order situation But then he faced the ire of Bal Thackeray. Thackeray objected to this Now that Thackeray had his cuts imposed he was keen to see the film released He asked the commissioner to resign as he had submitted to the pressure of the minority community

In fact the government should not allow any pressure tactics to work once the film is passed by the Censor Board It was wrong on the part of Mani Ratnam also to agree to delete the dialogue supposedly spoken by Bal Thackeray during the riot and spoken in the film by Tinnu Anand Once you submit to such threat by the leader of one community, you will face threats from leaders of another community also Ratnam would have been morally on much stronger ground in resisting the threats of Muslim leaders Once you submit to the fundamentalists of one community you have to give in to their counterparts in other community also. This is what has happened with 'Bombay' as well.

The second issue is artistic freedom An artist draws inspiration from real life situation A film has to be true to the events in life, if it has to leave its impact on the people An artist cannot be constrained by this or that religious beliefs or dogmas though he may care for values consecrated by this or that religion. Whether a religion permits marriage beyond its own community or not cannot be his consideration if it happens in real life situation. A film cannot be rejected on that ground. And it is for the people themselves to judge whether the film is worth watching. In the case of 'Bombay' also the Muslim masses did not respond to the Muslim leaders' initiative to get the film banned or to boycott it. Realising this these so-called leaders began compromising and dropped the idea of challenging the film in the court. Instead they suggested that a committee of some eminent citizens of Bombay including Usha Mehta, Nani Palkhiwala and Tinaikar be formed to decide whether the film should be released or not. It is significant that the Muslim masses, after what they underwent in the wake of demolition of Babri masjid sobered down and are not in a mood to respond to any act of misadventure on the part of their leaders. It is precisely for this reason that the Muslim masses did not boycott the film and flocked to see it once it was released

Also, it should not be for the religious or political leaders to decide whether a particular film be released or not unless there is direct attack on any religion In such a case the Censor Board is expected to be sensitive enough to disallow such a film Certain social, religious and cultural sensibilities are taken into account by the Censor Board authorities If it is left to political or religious leaders practically every film will come under attack In fact the films glorifying sex and violence are watched with avid interest by those very people who are objecting to this film Their sensibilities are then not hurt at all These films are certainly a direct attack on our religio-cultural values They do not even object to MTV which touches the height of vulgarity because that will not pay political dividends But their religious sensibilities are hurt if love binds two souls symbolising the harmony between Hindus and Muslims.

As for the film's contents, it is more commercial than of artistic variety. The first part of the film is the usual a boy-meets-girl story. There is hardly any serious treatment of the subject in this part The later part of the film becomes somewhat serious and shows the horrors of Bombay riots which really shakes the viewer. However, one is in for disappointment if one is looking for an analysis of the causes of the riot The hero of the film, caught in the orgy of communal violence, resorts to emotional outburst and appeals for restoring harmony. The director makes no attempt to understand the deeper causes of demolition of the mosque and subsequent violence. In this respect 'Tamas' made by Govind Nihalani, is of a far superior variety That film makes a serious attempt to understand the causes of partition and the violence which followed in its wake. 'Bombay', on the other hand, is a curious mixture of realism and fantasy. But, it must be said to the credit of the film that it does make an attempt to reduce the gulf between two major communities of India, i e, Hindus and Muslims. And, to that extent, the film is welcome.

Cleaning the Ganga

Shyam Divan

Innovative procedures used by the Supreme Court in its dealing with the litigations on the issue of pollution of Ganga waters has produced extraordinary results.

SHORT of putting on their gum boots and wading into the murky waters of the Ganga to clean up the mess, a bench of the Supreme Court has been doing a whole lot and more to restore the health of the river. Justice Kuldip Singh over the past two years has cajoled, prodded and driven recalcitrant industries and public authorities in the Ganga basin to comply with pollution norms. His efforts are commendable. His techniques novel. Even in conventional litigations, Singh brings to his court an informal style rooted in common sense. A public interest litigation to clean up the Ganga has caught the judge's fancy. Each Friday a huge shoal of advocates, administrators, company executives, and public officials attentively follow the court proceedings as a range of snappy judicial directions are issued. At present the Kuldip Singh court is tackling hundreds of large polluting industries in Uttar Pradesh, Bihar, and West Bengal; a slue of small municipalities that discharge untreated sewage into the river; half a dozen municipal corporations in the three states; the Eastern Railways; giant thermal power plants; numerous small units such as tanneries and almost everyone else despoiling the river. The litigation-affected parties are several hundred. How does the court manage the show?

The traditional view of litigation frowns upon judges who embark on such massive administrative exercises. Judges are required to retain their objectivity, impartiality and aloofness. They ought not soil their judicial robes by entering the administrative arena and taking decisions which are within the province of specialist enforcement agencies. This is old hat for the Ganga court. A new wisdom guides its approach. Dismayed at the persistent flouting of parliament's mandate to clean the rivers, by polluters and pollution control boards alike, the court is unwilling to sit idly by. The Ganga court functions a bit like a village panchayat dispensing justice in the shade of a banyan tree. The rigor of formal court procedures and statutory requirements are diluted in favour of a summary, result-oriented process. The main thrust is to substitute the ineffective administrative directives issued by the pollution control boards (PCBs) under the Water Act and the Environment (Protection) Act, with judicial orders, the disobedience of which invites contempt of court action and penalties. In view of the finality of the apex court's orders, there are few for the polluters but to comply.

The court's first task is to identify the erring polluters. For this it looks to M C Mehta, the well known environmentalist and advocate, who petitioned the court in 1985 to clean up the river. Mehta was initially encouraged by a series of orders requiring tanneries in Jajmau near Kanpur to install primary effluent treatment plants or close down. In 1988, the Kanpur Mahanagarpalika was directed to treat sewage discharged into the river. The court and Mehta hoped that these stern warnings would have a salutary effect and spur the PCBs of the three riparian states to move swiftly against other defaulters. Their hopes were soon dashed. The PCBs, which Mehta describes as "100 per cent anti-people", did next to nothing. Indeed, it is in response to this callous neglect that the Supreme Court has assumed an aggressive, pro-environment role in the Ganga case.

Once the polluters are identified, the court orders each firm to meet the effluent standards within a period of three months, or else face closure. Singh hopes that the shadow of closure will stir hard-headed businessmen to treat their factory effluents. To emphasise the urgency, the orders threatening closure are issued *ex parte*, that is, without hearing the company. The court directs the PCBs to immediately serve notice on the unwary polluters, setting out the Supreme Court's deadline. Compliance must be reported to the board. At the end of the period, each board files a status report together with recommendations for future action. The willing are granted extensions to clean up their act. But for the obstinate, it's closure. On numerous occasions the court has shut down big and small firms. On December 3, 1993, 13 industries in the UP which had flouted the court's directives and failed to install effluent treatment plants (ETPs), were closed with immediate effect. Two weeks later, nine factories were sealed in West Bengal and in January, 15 more units were ordered shut. This pattern of strict enforcement has prevailed throughout 1994 and 1995. Where the discharge levels are achieved, the board is asked to inspect the working of the ETP and report to the court. Given the dismal record of the PCBs, it is no surprise that even this elementary task is at times entrusted by the court to the National Environmental Engineering Institute (NEERI), Nagpur.

More than industrial sources, however, it is the towns and cities along the Ganga which cause the most pollution. The state governments say that crores of rupees have been disbursed under the Ganga Action Plan to municipalities for installing treatment facilities. But the court is sceptical about these claims. Justice Singh and his companion judges have asked each of the three states to set up special cells in their secretariats to oversee the speedy implementation of sewage treatment schemes. Meanwhile, NEERI is assisting the court by examining treatment facilities in all the riparian municipalities.

The sprawling dimensions of the Ganga case have pressed the court to evolve new procedures. Unlike unsual litigations, affected polluters are dissuaded from filing documents in the court's registry. All affidavits must be tendered before the respective boards. In this manner, the court hopes to reduce its administrative burden. Moreover, to tailor its directions to each situation, the Ganga court issues orders piecemeal. What at the end of the day reads like the comprehensive court order, is in fact a series of directions – dictated one paragraph at a time – and punctuated by brief arguments on each issue. It is this procedure that enables the court to respond with specificity to each situation.

As a result of these innovative procedures the Ganga court has got results. Hundreds of factories have installed ETPs. Small-scale units are busy complying with minimum standards for effluent discharge. The municipalities are creeping towards compliance. Bihar's thermal power stations at Bokaro and Patratu have ordered equipment to abate pollution. Even the Eastern Railways, after much foot-dragging, has agreed to treat the waste water gushing out from Howrah station. More generally, the Supreme Court has succeeded in building up a sustained pressure on industry and municipalities, where the PCBs have failed. Throughout the Ganga basin there is heightened environmental awareness among administrators, the subordinate judiciary, police and municipal officials, all of whom are involved in implementing the Supreme Court's orders.

The activism of the Ganga court has encouraged the Gujarat High Court to launch its own crusade against pollution. A December 1994 newspaper article reporting that Gujarat was the most polluted state, spurred the court to exercise its inherent jurisdiction and register a case against the remiss PCB. In an echo of the Ganga proceedings, dozens of polluting industries were ordered shut in April 1995, whilst other firms were given short deadlines to comply with statutory norms.

Impressive as all this may seem, unless the PCBs are overhauled quickly the gains will soon dissipate. There are limits to what a gung-ho court can do in the face of an indifferent bureaucracy. The boards in the Ganga states appear resigned to doing no work except for a knee-jerk response to judicial orders. Besides, the word on the

street is that the Supreme Court's orders are misused by dishonest board officials to line their own pockets. Unless a bribe is paid, an unfavourable report is made to the court. There are other pitfalls. The massive administrative tasks assumed by the court, will sooner or later expose judges to criticism previously directed at administrators. Arbitrariness in passing closure orders without attention to special factors or hearing the affected party, are but a few of the concerns voiced by lawyers. None of this lends to the prestige of the court. Indeed, if a subordinate judge dares to assume the expansive administrative role of the Ganga court, he would probably be admonished for exceeding his jurisdiction.

If the Supreme Court's activism is to have a lasting impact, a new political will in the form of budgetary allocations at the municipal level and greater community pressure on board officials is necessary. Left to themselves, the PCBs will revert to a culture of slipshod enforcement. And for the Eastern Railways and the tanneries of Jajmau, this will mean business as usual.

Kadi: Signs of Dalit Assertion

Kiran Desai
Rasik Parmar

In response to the events in Kadi, when upper caste mobs attacked and looted dalit property and injured several, the dalits have launched a systematic agitation, which the BJP government cannot ignore.

RECENT research carried out by well known Gujarat activist Martin Macwan suggests that Gujarat stands third in terms of number of cases of dalit atrocities committed per every one lakh dalit population (146.27 crimes per one lakh). The study indicates that within four years (between 1990 and 1994) the increase in the crime-rate (against dalits) has been phenomenal 99.58 per cent. (The similar percentage for STs is as high as 251.21 per cent). Though a section of intellectuals as well as police always claim that practice of untouchability has been disappearing and crime-rate against dalits has been declining the reality is different as the above-mentioned findings suggest. The recent incidents at Kadi, in fact, shows that with the advent of BJP 'raj', the dominant higher castes have become more crude and cruel and ready to launch direct assault on dalits.

Kadi is a small town-place of Mahesana district of north Gujarat region. The town is hardly 70 to 80 km away from Ahmedabad. The population of Kadi is 42,899 according to 1991 census. The proportion of scheduled castes population are 8.7 per cent. Vankar and chamar are the two main sub-castes among the dalits. The population of higher castes of which main caste is patidar or patel is round about 30 per cent. Kadi also has sizeable population of Muslim community

The event which has evoked spurt of activities among dalits and has put Keshubhai's BJP government in embarrassing position took place on May 12, 1995. There are two versions of what actually preceded the events which culminated in the destruction and looting of dalit shops and other properties. The dalit's version is that when a young dalit boy and girl went to a shop to buy a comb, the higher caste owner tried to cheat them and on that point some altercation took place. Infuriated by the arguments the patel shop-owner called other shopkeepers, belonging mostly to the patel caste, and started beating up the two dalits. Dalit vendors and rickshawdrivers soon came to his rescue as did the mother of the boy. Meanwhile, Nitin Patel, health minister of Gujarat, who is a local MLA, also appeared on the scene. The agitated mother took Nitin Patel to task, asking what he and his fellow-patels were up to. Patel summoned BJP and Bajrang Dal workers as well as patels of surrounding villages to the site and in presence of responsible police inspectors incited them to attack dalit residential areas. The mob of say 5,000 systematically armed with lethal weapons went on a looting and arson spree for four to five hours, mainly attacking shops, workshops and activities related to dalit trade. Houses were burnt and dalits were beaten up badly. They had lethal weapons and instruments.

The patels, on the other hand, gave a different account. The dalit youth who had come to buy, in fact, simply snatched the comb from the shop, saying that he was a 'dada' and not in the habit of giving money in exchange. The patel shop-owners were fed up with this mafia-raj of dalits. Dalit vendors, it is said, stood in front of shops and persuaded the buyers by hook or crook to buy from them, obstructing the patels' businesses. If the owners opposed this practice, they simply threatened to sue them under the atrocities act. So this time they decided to retaliate: In response, dalit mobs attacked the patels.

Since then, a number of persons including political leaders of the Congress and the BJP, activists, press-reporters and other entities of public life, have visited Kadi to have an on the spot inquiry into the happenings. None of these visitors have denied that dalits were the only victims of arsoning. Even the state BJP president Kashiram Rana has demanded a judicial inquiry. In all 99 persons, all dalits, were affected. Around 40 dalits were injured. If we take a stock of the damage in economic terms, the estimate comes to Rs 32 lakh approximately. Nothing was spared. Big shops and workshops, repairing shops, cabins, carts, pan-stalls all trade and business places of dalits were attacked systematically. It seems that it was a well-planned assault to destroy dalit's economic base. It cannot be a spontaneous reaction. The presence of Nitin Patel and the method in which he got the patels of the surrounding villages together to form a 'sena' clearly indicates that the patels wanted to teach the dalits a 'lesson'.

But the dalits have also decided not to let go of this incidence as yet another incidence of dalit atrocity by remaining silent. Backed by various activist groups they have launched a systematic agitation to get justice. Their main demands include removal of Nitin Patel from the cabinet instituting cases under the atrocities act against those who were involved, withdrawal of false cases filed against dalits, the arrest of real culprits, compensation for damages, suspension of police officers who had acted in alliance with the patels, setting up of inquiry commission headed by a retired high court judge. It is almost a month since they have set up camp in Gandhinagar. A massive rally which was attended by dalits and dalit supporters was organised on May 19 in Ahmedabad. The rally had certainly showed the strength of dalits.

Keshubhai Patel, the Gujarat CM, has been put in a tight spot. On one hand, he cannot remove Nitin Patel as then it may make the patels whom Keshubhai represents in the battle royale between patels and other social groups in Gujarat polity unhappy. Patels of Kadi have written an open letter to the dalit-camp in Gandhinagar, threatening them with dire consequences if they did not leave the camp. If BJP wants to make inroads into backward social groups, they cannot simply put aside an event such as this in order to shelter a minister. Apart from the opposition Congress Party, even the rival faction of Rana (state BJP chief) and Vaghela also want some political gain out of this event.

Whatever implication this event would have for BJP or Congress, it is certain that social equality still remains a distant dream. Socially and politically higher and dominant groups simply cannot see dalits improving their social and economic status. At the same time dalits too have become aware and will fight against their oppression tooth and nail. Their response to the recent incidences of Golana, Sanbarda as well as Kadi clearly suggests that the dalit force in Gujarat may not be as strong as in Maharashtra but it has been getting stronger.

Deconstructing Literacy Primers

Anita Dighe

Literacy primers developed for illiterate adults, the target population of Total Literacy Campaigns, serve a socialising and acculturating function. Do they reflect the reality of the lives of illiterate adults, men and women? What are their ideological underpinnings and whose interests do they serve.

THE Total Literacy Campaigns (TLCs) that are specifically designed to address the problem of adult illiteracy have to be seen not only as social but as cultural phenomena. Cultural values, ideas, beliefs, are constantly transmitted both overtly and covertly in the educational process. In the school system, textbooks are the repository of formalised learning but in the case of the TLCs, the absence of materials except for literacy primers in most cases, virtually guarantees the sanctity of learning from the primer The questions that need to be asked are; 'Who is defining knowledge?' 'Whose knowledge is considered of most worth?' Such questions recognise the curriculum of TLCs as being characterised by selectivity, involving choices of what to teach, which in turn highlights the ideological nature of such choices.

The literacy primers developed for the illiterate adults pose a challenge in text probing For, they are written for those men and women who constitute the poorest and the most deprived strata of society. The Revised National Policy on Education (1992) has therefore emphasised the need to involve the participants of the literacy programme in various development programmes. The policy document has further stipulated that the National Literacy Mission (NLM) should be geared to such national goals as poverty alleviation, and focus specifically on environmental conservation, observance of small family norm, national integration and promotion of women's equality. With regard to women's education, the policy has emphasised that the education system would play a positive interventionist role in the empowerment of women.

On the basis of the above policy directives, the directorate of adult education (DAE), a subordinate office of the department of education in the ministry of human resource development (MHRD), issued a set of guide-lines to the state resource centres (SRCs) which are registered societies fully funded by the MHRD, to assist in preparing suitable literacy primers for the illiterate adults. The emphasis in these guidelines on the concept of improved pace and content of learning (IPCL). The thrust of IPCL is on pace, as the name suggests, and an emphasis on a certain core content relating to the above mentioned national goals. A thin booklet, spelling out the IPCL guidelines, was initially issued by the DAE to various SRCs. This was subsequently replaced by 'Handbook for Developing IPCL Materials' published by the DAE in September 1993. While the actual writing and publishing of the literacy primers for the TLCs is the responsibility of the SRCs, in most states of the country, the fact remains that an agency wanting to develop its own literacy materials has to strictly adhere to the IPCL guidelines Furthermore, a national level committee set up by the MHRD scrutinises the content of the literacy primers in order to ensure a cer-tain uniformity of form and content among them

Considering the fact that primers serve a socialising and acculturating function, it was thought that a systematic analysis of the content of the literacy primers would be useful. Questions such as 'from whose perspective are the primers designed?' 'Do the primers reflect the reality of the lives of the illiterate adults, particularly of the illiterate adult women?' were considered to be of particular relevance. Six literacy pri-mers in Gujarati, Marathi, Hindi and Tamil to represent the states of Gujarat, Maharashtra, Uttar Pradesh, Bihar, Madhya Pradesh and the UT of Pondicherry, were carefully analysed. The analysis revealed that there were certain patterns that were common across the various langauge primers.[1]

One of the principal concerns addressed in literacy primers are various development problems and issues. While development problems such as illiteracy, health, agriculture, population issue, environment degradation, information about certain government schemes/services are addressed in the primers, interestingly the underlying assumption in the lessons that deal with development issues is based on the modernisation theory of development. According to this understanding, it is individuals who need to bring about a change in their attitudes and behaviour so that they can improve their conditions and participate actively in the development process. Similarly, illiteracy is posed as a problem due to the attitude of the illiterate adult. It is the individual's lack of initiative and absence of motivation that is considered to be responsible for the problem of illiteracy. Illiterates are regarded as uninformed, as lacking in knowledge and literacy is regarded as a panacea for their ignorance. There is thus no attempt to understand why certain sections of the community have no access to education in the first place. The larger structural issues are not even recognised, much less addressed.

The basic thrust is 'victim blaming' and not 'system blaming'. Individuals have to be thrifty, save money and thereby better their economic condition. Individuals have to seek information about health matters through individual initiative and thereby bring about personal and family betterment. Individuals have to protect their environment and avoid environmental degradation. It is enlightened individuals who can deal with social evils of dowry, excessive drinking, belief in superstitions, etc. It is enlightened individuals who will restrict the size of their families and thereby deal with the problem of population growth. Rarely is change considered feasible through community initiative and community participation.

What is disquieting is that despite 'women's equality' being stated as a national goal, it is basically the ideology of domesticity that is promoted in the literacy primers. Thus, women's principal responsibility as depicted in the visuals and in the text, remains within the confines of the home and it is the nurturing, nursing, caring role as a mother and as a housewife that is emphasised. In these texts a woman's identity is established through her status as a married woman for rarely are women shown as widows or as independent single women. Also, the husband-wife relationship is always hierarchical. In this relationship, the husband is the authority figure and the woman is either a helpless character, often a housewife content to do all the household chores. Despite women's participation in the economy, the literacy primers not only pay insufficient attention to this aspect, they also fail to impart knowledge and skills that would improve women's productive role. In other words, there is the overall tendency to emphasise the domestic and reproductive role of women and to invisibilise the productive role they play in society. In the Marathi primer, a female character Sumitra elaborates on her daily routine. After getting up at five o'clock in the morning, she washes utensils, finishes her cooking, takes the washing to the well, collects water, then goes to the field with her husband's food and assists in the field. On her return home in the evening, she collects cowdung as well as fuelwood. When she reaches home, she feeds the cattle and milks the

buffalo, then cooks the evening meal, while her old mo-ther-in-law takes care of her younger child Sumitra would like to study but she doesn t find time But Sumitra is uncomplaining – she does not question the sex role patterns that are responsible for her doing all the household chores She is reconciled to her status as a wife, mother, daughter in law She even seems content Even when there are attempts to show women as protagonists by and large, such examples are few and far between In the Hindi primer from Bihar there is an attempt to portray a woman character (Kamala) as a village sarpanch But Kamala is one lone character who is portrayed in what would be regarded as a male preserve in the conservative Hindi belt and in that sense would immediately become an atypical character On the whole in all the six primers women and men are shown to have traditional stereotypical concerns that have characterised gender roles in society

The perspective on the issue of population problem is that of the government Poverty of the country is linked to population explosion The Bihar primer has several lessons that are directly concerned with the population issue and others that have a latent message The message clearly is that there are plentiful natural resources – enough land, adequate rains, thick forests etc However, these rich natural resources are not adequate because of the increasing population and it is the poor who are to be blamed for procreating, thus leading to over population As they throng public spaces, they leave little room for the others' who do not breed like them In the primers from Gujarat UP and Bihar, it is the simplistic family plan ning message of 'small family is a happy family that is relentlessly pushed The poor are clearly perceived as ignorant and uninformed It is assumed that once they control the size of their families, all the problems would be solved Thus no attempt is made to understand why the poor have large families in the first place Nor is there an attempt to understand the adequacy or the effectiveness of the existing health infrastructure in meeting the health needs of the poor in rural areas Women's role on population issues is clearly regarded to be supportive of the decisions taken by the husbands The health needs of the women, besides those relating to maternal health, are not even recognised

Even with regard to the issue of environmental degradation the approach is clearly to 'blame the victim' for it is the learner who is reproached for his/her ignorance about the importance of trees, the learner who is blamed for cutting down trees indiscriminately There is thus no attempt to identify the real culprits such as con-tractors, the forest officials, the local politicians who most often than not, are responsible for cutting down trees The learner is also blamed for not taking good care of environmental sanitation The assumption here is that there is sufficient water and that resources are readily available for maintaining environmental sanitation in rural areas Even the gram panchayats are presumed to have the requisite financial resources to undertake various development tasks relating to environmental sanitation

Of the core national values, national integration is also stated as one besides women s equality, propagation of small family norm and conservation of environment This proved to be the most difficult for either there is a superficial treatment in some lessons through stereotypical representation of characters with varied dress and headgear or there is no attempt to portray the minority community either visually or through the text In the case of the Marathi primer, except for one lesson on Akbar and in this lesson too, it is the legendary character of Birbal who is shown to outwit Akbar, there is no refe rence to a single character – male or female – who could be called a member of the minority community There is no attempt even to refer to any cultural event or festival or present any overt symbol that would reflect the plural character of Indian culture It is the textual silences' – or what the text omits – that highlights the ideological nature of the text The names of the characters are only Hindu and any reference to festivals is to those celebrated by those belonging to the majority community While the dress of women portrayed in the visuals does not stereotypically differentiate them, the fact that they are shown to be wearing 'bindis' and have Hindu names, confirms that certain 'exclusionary mechanisms' have been consistently used in the text Interestingly, the UP primer reflects much greater acceptance of the multilingual and multi-ethnic character of the Indian society But the emphasis throughout is on assimilation into a single monolithic identity for the sake of the country This emphasis on assimilation is cleverly disguised under the garb of patriotism The idea is to mould everyone into one 'dhara' – thus giving up personal affiliations and identities This process of assimilation translates itself into a particular monocultural identity that is very "Hindu' in its orientation It is apparent from the text that anyone who is different and wishing to preserve his/her linguistic and religious identity, would be made to feel guilty [2]

Absence of Social Conflict

A remarkable feature of the literacy primers is the total absence of any kind of social conflict. The depicted in the primers is divorced from the material and social conditions of the poor in rural areas Different caste and class groups coexist peacefully Thus, Vadgaon is portrayed as a model village in the Marathi primer in which the development activities are carried out by the gram panchayat and all the basic amenities are provided to everybody in the village This is because there is unity among all sections and there is no strife, no conflict On the other hand, another village Pimpalgaon, lacks all these amenities because of an inactive gram panchayat which it is suggested could be activated by all the villagers coming together and finding a common solution The overall image is thus of a harmonious social reality in which co operation and solidarity among all members is possible Conflicting social relations among members of different classes is absent from the society portrayed in the six literacy primers Whenever there is any dissonance, it is quickly resolved through the intervention of a character Most of the narratives have a 'fairy tale' quality about them as characters become instantly prosperous, husbands and wives live happily everafter, and the problems of the villages get instantly solved Krishna Kumar (1989) has referred to the manner in which the areas covered by a typical

NIPFP NATIONAL INSTITUTE OF PUBLIC FINANCE AND POLICY, NEW DELHI

Applications are invited for the post of **Senior Consultant** for Health Economics Cell on a consolidated salary of Rs. 8,000 to Rs 10,000/- The post is for the period of six months and likely to be extended.

Essential Qualifications : M D in Community Medicine with specialisation in Health Economics/Medical Insurance and five years' research experience or Ph.D. in Economics with specialisation in Insurance and five years' research experience.

Desirable qualifications : Knowledge of quantitative techniques, experience of working in a well-known hospital and published papers on Health Economics in referred journals.

Other things being equal, candidates belonging to Scheduled Castes/Scheduled Tribes will be given preference.

Applications indicating qualifications and experience supported by true copies of certificates and testimonials should reach the Secretary, National Institute of Public Finance and Policy, 18/2, Satsang Vihar Marg, Special Institutional Area, New Delhi-110067 within 15 days from the date of advertisement.

literacy curriculum follow a certain mythology according to which all the problems that the illiterate adult is faced with is due to a disorganised, unthinking, ignorant personality. What is promised to the illiterate adult therefore is better life, new knowledge and skills (including literacy), overall prosperity and general well-being. The state is perceived as a benign state that has the welfare of all the people at heart. The services provided by it are considered to be efficient and easily accessible. The role of the state and of the dominant classes in perpetuating class and gender oppression is overlooked, even bypassed. Rather, what is proposed is that inequities in society should be accepted and not be questioned.

Since adult learners are held responsible for their present state of poverty and illiteracy, the overall tenor of the lessons is to provide 'correct' information, to exhort the learners to change their negative attitudes so as to bring about a change in their behaviour. There is therefore a tendency to talk down to the learners as though the illiterate minds are 'empty vessels' waiting to be filled by the sagacious advice given in the literacy text. Freire (1985) refers to this phenomenon as the 'nutritionist view of knowledge' according to which the illiterates are considered as 'undernourished' and have to be 'fed' of 'filled' in order to know. So the illiterate adults are asked to come to study because it would be desirable for them to become literate. Adults are advised to save money and use it properly and not waste it. In most cases, the learners are perceived as a passive mass who have to be told what to do and who do not have a life or will of their own. An analysis of the tone of discourse revealed that on the whole it tends to be didactic and patronising. Humour and light banter are remarkably sparingly used.

The analysis has highlighted certain recurring patterns among literacy primers developed by the SRCs. But even in the case of the Pondicherry primer that was developed by the Bharat Gyan Vigyan Samiti (BGVS), a left-leaning autonomous NGO, the ana-lysis revealed that despite the revolutionary fervour of the lessons, the real intent is to carefully bleach away any political questioning. Thus when the lessons state 'we must find out why', 'we must change all this', 'we must question plan outlays, defence expenditure, etc,' what we are witnessing is an attempt at co-option, at generating 'false consciousness'. Under the garb of radical rhetoric, the literacy primer is really promoting the agenda of the state. The 'pseudo-Freirean' nature of such a literacy primer is made explicit.[3]

The role of the state has to be recognised in order to understand the hegemonic control that is maintained by it. By providing finances to the SRCs (as well as to autonomous organisations such as the BGVS), the state ensures that the information contained in the literacy materials is state-approved. Likewise, guidelines for preparation of literacy materials and constitution of a national level screening committee, further safeguard the state's interests. The ideological bias of the literacy primers, however, becomes evident for it is the culture of the mainly urbanised, middle class men that is invariably reproduced in them. The legitimation of the culture of this dominant class occurs in two ways; overtly, through bias, stereotype and distortion of subaltern culture, particularly that of poor women, and covertly, through omission of and silences of subaltern culture and once again, that relating to the reality of the lives of poor women.[4]

The importance of undertaking such an analysis of literacy primers lies in the fact that it tries to decipher and analyse their ideological underpinnings and thus enables us to understand whose interests this ideology represents and serves. Besides this, such an analysis is useful in order to understand why and to what extent the literacy primers facilitate or hinder adult learning. One important outcome of such work, however, is the realisation that primer writing for adults is a complex endeavour that demands a creative response so that literacy learning becomes less daunting, less alienating and certainly more relevant and closer to the reality of the lives of adult women learners.

Notes

[The observations which inform this paper come from a larger study undertaken by the National Institute of Adult Education, New Delhi. Those who collaborated in this study with me were Ila Patel, Ilina Sen, Prabha Krishnan, Sadhna Saxena and Azra Razzack. While acknowledging their individual contributions, I own responsibility for the particular analysis provided in this paper.]

1 Detailed analysis of the six primers has been attempted by the six researchers mentioned above.

2 Azra Razzack's analysis of the SRC primer from UP further showed how the four lessons that deal with the plural character of Indian society do not really get integrated into the text of the other lessons in that sense, stand apart.

3 Prabha Krishnan, in her analysis of the Pondicherry primer refers to what Ross Kidd and Krishna Kumar (1981) have described as the domesticating role of literacy programmes and termed them as 'pseudo-Freirean'. According to them, there are five steps through which education, which should have been liberating, succeeds in domesticating its object. These are–
- naming the central problem as 'poverty' rather than as 'oppression';
- identifying the cause of poverty as self-inflicted deficiency of the poor;
- proposing, as treatment, to change the behaviour of the poor through transmission of information and skills;
- converting Freire's method into a 'neutral' classroom technique without 'politics'; and
- defining 'action' as coping activity.

Krishnan's analysis showed that the central problem that characterises the illiterates is identified as poverty in the Pondicherry primer and while the literacy lessons urge learners to action, this action is not Freirean praxis but coping activity, channelling the collective energies of the learners down predetermined avenues.

4 While Timothy Scrase has not specifically focused his analysis on the issue of gender, his study on the content of English language primers and readers prescribed for use in West Bengal schools revealed that it was the culture of the mainly urbanised, middle classes that was invariably reproduced in the textbooks.

Climbing Down the Golan Heights

Advantage to Syria

Ninan Koshy

The improved military strength of Syria after the Gulf war has put it in a better bargaining position vis-a-vis *Israel and the US who, in view of the forthcoming general elections, are under pressure to take a definite stand on the issue of the Golan Heights.*

THE fresh momentum in talks between Israel and Syria and a cautious optimism about a peace agreement between them are generally attributed to the compulsions of electoral politics in both the US and Israel. What is less recognised is that it is a significant increase in the military strength of Syria in the wake of the Gulf war, altering security and strategic perceptions in the area including those related to the Golan Heights, that has given the main impetus to the talks.

That is why contrary to the general impression, it is Israel more than Syria that is keen about an agreement. In spite of major hurdles some of which are capable of causing total disruption to the peace process, Israel can still claim an accord with the Palestinians. It can, as it sometimes does, more triumphantly hail the agreement with Jordan. But Israel knows that it cannot really claim any real success in the Middle East peace process unless there is an agreement with Syria

Crucial Factor of Elections

The most important domestic factor in this context is the general elections in Israel next year. Prime minister Rabin is on the horns of a dilemma. While a peace agreement with Syria will definitely earn him high dividends internationally, the terms of the agreement have to be such that domestic support does not dwindle but increase. This is far from easy.

Recent statements by foreign minister Peres and prime minister Rabin reflect this difficulty. It has become almost a practice for Peres and Rabin to speak differently on the same issue. While this may not always be the result of a tacit agreement between the two on each issue, the practice has often become a tool in negotiations.

During a visit to Morocco, Peres told *Yediot Aharonot*, an Israeli newspaper, that he informed king Hussan II that the Golan is 'Syrian land'. "We do not want to keep hold of Syrian land. The Golan plateau is Syrian land and we have settled on the Syrian land", the newspaper quoted Peres.

In preparing to give up the Golan plateau, Peres appeared to be climbing up the moral plateau. He said, "The decision to make a peace agreement with Syria stems from our moral values. We do not want to exercise power over another people, and that includes the Golan plateau which is not part of Eretz Israel (the land of Israel)"!

Peres went on to compare the crucial Golan issue to the 1979 Israeli-Egyptian peace treaty based on the agreement for a total withdrawal from Sinai which like the Golan Heights was captured by Israelis in the 1967 war. "The price is the price we also paid in the Egyptian matter", said Peres.

But Rabin said that Tel Aviv would not withdraw its troops from the Golan Heights before an agreement on the normalisation of relations with definite arrangements on security matters. He also said that his government would not sign a peace accord with Syria before conducting a general referendum in Israel.

The impression that Syria is now ready for negotiations owing to its sense of isolation is not necessarily correct. Syrian president Assad knows that there cannot be a full and comprehensive peace treaty in West Asia that does not bear his signature. He also realises that he can now negotiate from a position of strength.

This, however, does not negate a sense of isolation. During the time of Israel's agreement with Jordan, king Hussein said that Jordan these days is looking after its own interests and not waiting for a unified Arab position. While in the early stages of the Madrid talks, president Assad could pose as the representative of a bloc comprising of Jordan, Lebanon, Syria and the Palestinians, now only Lebanon is left with Syria.

Syria, however, can claim that it is not its fault that this has happened., Damascus continues to insist that the parties to the peace process abide by the principles laid out at the Madrid conference where Syria did lead efforts to work out a common Arab position.

Among the Arab parties to the peace process, Syria had been more outspokenly critical than the others of the Palestinian leadership for reaching a separate agreement with Israel. "It is PLO which pushed itself out of Arab co-ordination and not the Arab parties which forced PLO out", the Syrian foreign minister remarked at that time.

When Syria agreed for resumption of talks with Israel in March 1994, it made clear that the decision to return to Washington was one of principle and that Syria would attend only if there was evidence of Israeli willingness to abide by the terms of the relevant Security Council resolutions and if there was an agreed Arab position.

In October 1994, when president Clinton visited Syria, Israel had hoped that Clinton would be able to get major concessions from Assad. But Israel was disappointed. Even on the issue of terrorism nothing conclusive emerged. President Assad said that terrorism was not a separate item on the agenda and added in Clinton's presence, "we had more important matters to discuss". Israel had to accept the fact that rather than changing Assad's mind, Clinton repeated many of Assad's themes, like 'just peace' and 'land for peace', and Syria's importance in establishing regional peace. Assad affirmed, "Syria wants to establish peaceful, normal relations with Israel in return for full withdrawal from the Golan to pre-1967 border, and from South Lebanon".

For both Clinton and Rabin the decisive domestic factor is the same – elections next year. If Rabin fails to tackle the highly emotional issue of the Golan Heights and the settlements there very soon, he is unlikely to have the political space or time to do it later.

Clinton also is in a similar predicament. His administration surely needs a foreign policy victory and needs it urgently. With the dismal failure in Somalia and with the fiasco in ex-Yugoslavia, West Asia is still claimed to be the success story. With the Republicans assiduously campaigning for Jewish votes, any set-back in the Middle East will affect Clinton's electoral prospects.

There are those who still believe that Rabin intends to 'freeze' the Syrian question until after the 1996 elections. They feel that Rabin may not want to confront the Israeli public on the Golan Heights issue before the elections.

There is considerable opposition in Israel to any deal with Syria involving withdrawal from the Golan. The settlers in the Golan have been able to launch a highly successful campaign with the slogan, 'Peace with the Golan'. They have projected an image of hard-working, peaceful secular farmers in contrast to the militant 'fundamentalist' and often violent Jewish settlers on the West Bank and Gaza. This has appealed to the general public, evoking sympathy and support of a large section including some members of the parliament belonging to Rabin's Labour Party.

It is to assuage the feelings of this section that Rabin, without admitting that Israel was changing its position on which there had been hints, asserted that an initial withdrawal from the Golan would be 'marginal', followed by a three-year 'probation period' for the Syrians. This would mean that any major

withdrawal could come only three years after the elections, i e, in 1999. Syria has rejected this proposal.

Syria's Military Strength

A major factor in all the recent moves on both sides is the significant increase in Syrian military strength. Contrary to the general impression, the collapse of the Soviet Union and the end of the cold war did not lead to a military weakening of Syria. President Assad had always maintained that he would conduct negotiations with Israel only from a position of strength. This was interpreted as meaning achievement of strategic parity with Israel. According to many observers Syria is close to attaining it.

Syria was a major beneficiary of the Gulf war. Its participation in the US-led alliance against Iraq was a calculated move and involved a dramatic shift in its position. The US was obliged to a government which was high on its list of terrorist states. It was this obligation which paved the way for the strengthening of the Syrian military. The first help was from the US itself which secretly made available to the Syrians some of the best captured Iraqi tanks and self-propelled guns. Since Syria was still on its list of terrorist states, the US could not directly give any aid to Syria. But it convinced some unnamed European countries to grant Syria several hundred million dollars after the Gulf war. In addition to subsidies from Kuwait, the UAE and Qatar, Syria received a grant of $ 1.5 billion from the Saudi royal house. There is reason to believe that such grants have continued.

The Soviet Union's support for Syria virtually ceased since Gorbachev assumed power. Consistently pro-Israel in his policies, Gorbachev expected Syria to make peace with Israel even on Israeli terms. Soviet weapons sales to Syria stopped. When the Soviet Union collapsed the new government in Russia would sell weapons to Syria only for hard currency which Syria lacked. But with generous Saudi funding and tacit US support Syria has been able to acquire highly sophisticated weaponry previously unattainable from the Soviet Union. Former USSR states, including Russia, became major suppliers. There was also the expanding open bazaar of arms in the region. North Korea is mentioned among the countries which made supplies to Syria.

It was the common perception of Syria and Saudi Arabia that only a militarily strong Syria could withstand Israeli attempts to impose on Syria a peace treaty on Israeli terms. For more than two-and-a-half decades it was generally believed that the Israeli army breaking through the Golan Heights ceasefire line could reach the outskirts of Damascus in less than 24 hours. Israeli commentators admit that today Syrian armoury is capable of stopping an Israeli attack simultaneously on two fronts, in the Golan Heights and the Lebanese border. Syria is also capable of retaliating forcefully and effectively in the event of any Israeli air offensive against it. For the fist time in West Asia, a state (in this case Syria) is capable of defending itself with credible military strength against Israeli attack. The full extent of Syria's military build up was apparently not known to the Israelis for a long time. Once it was known, Israel began to evince a desire to negotiate a genuine deal with Syria.

There has been a shift in the US position too. Until 1991 the Americans, regardless of what they openly declared, did not want Israel to withdraw from the Golan Heights. It was Syrian participation in the US-led alliance against Iraq which changed the American attitudes. With its pronounced policy against both Iraq and Iran, the two other major players in the region, the US feels that it may be advisable to win over Syria.

While the Americans have repeatedly urged Syria and Israel to find agreement quickly, the two governments are aware that the chances of increasing the quantum of aid will grow as elections in the US get closer. The bonanza Israel and Egypt received after the Camp David agreement is recalled.

On June 11, the daily, *Jerusalem Post*, reported that Israel is to demand $ 2.5 billion military aid package from the US as compensation for any withdrawal from the Golan Heights. The list of demands includes surveillance and co-ordination airplanes, stationary ground early warning stations, satellite transformation and linkage stations and access to US high-resolution satellite information on the region.

Israel is well aware that in the age of supersonic planes and missiles the Golan Heights give no strategic or tactical advantage as they may have done years ago. But it is not easy to convince the Israeli public about the withdrawal, especially with the majority of voters against the removal of the settlers.

In fact, the long-term concern of Israel about the Golan is neither military advantage nor the settlements but the control of the underground water resources of the Golan. The Syrians have indicated that they may be willing to negotiate mutually advantageous sharing and supervision of water resources if and when Israel withdraws.

In the current Washington talks, rather than attempting to come to an agreement on the main issue, namely, Israeli withdrawal from the Golan, discussion centres around the possible security arrangements in the area, in case Israel withdraws from the region.

	As on March 31, 1995	As on March 31, 1994
Schedule 1—Capital		
(A) Capital		
Amount brought into India by way of start-up Capital	2,000	2,000
TOTAL	2,000	2,000
(B) Amount of Deposit kept with the Reserve Bank of India u/s 11 (2) of the Banking Regulation Act, 1949.	32,100	32,100
Schedule 2—Reserves and Surplus		
I. Statutory Reserves (Reserve under Sec. 11(2)(b)(ii) of Banking Regulation Act,1949)		
i) Opening Balance	21,325	14,271
ii) Additions during the year	10,562	7,054
	31,887	21,325
II. Capital Reserves		
i) Opening Balance	1,200	1,200
ii) Additions during the year	NIL	NIL
	1,200	1,200
III. Revenue and Other Reserves [See note II]		
i) Opening Balance	40,763	40,763
ii) Additions during the year	NIL	NIL
iii) Deletions during the year	NIL	NIL
	40,763	40,763
IV. Balance in Profit and Loss Account	99,445	65,904
TOTAL	173,295	129,192
Schedule 3—Deposits		
A) I. Demand Deposits		
i) From banks	27,028	8,553
ii) From others	586,945	387,651
	613,973	396,204
II. Savings Bank Deposits	319,515	218,714
III. Term Deposits		
i) From banks	NIL	76,500
ii) From others	1,954,511	2,096,722
	1,954,511	2,173,222
TOTAL	2,887,999	2,788,140
B) I. Deposits of branches in India	2,887,999	2,788,140

(Rs. in thousands)

	As on March 31, 1995	As on March 31, 1994
Schedule 4—Borrowings		
I. Borrowings in India		
i) Reserve Bank of India	NIL	NIL
ii) Other banks	NIL	NIL
iii) Other institutions and agencies	NIL	NIL
II. Borrowings from outside India	NIL	NIL
TOTAL	NIL	NIL
III. Secured borrowings included in I and II above	NIL	NIL
Schedule 5—Other Liabilities and Provisions		
I. Bills payable	8,494	7,218
II. Inter-office adjustments (net)	16,464	13,566
III. Interest accrued	193,315	159,793
IV. Others (including provisions)	47,977	36,271
TOTAL	266,250	216,848
Schedule 6—Cash and Balances with Reserve Bank of India		
I. Cash in hand (including foreign currency notes)	1,961	2,128
II. Balances with Reserve Bank of India		
i) in Current Account	530,733	805,434
TOTAL	532,694	807,562
Schedule 7—Balances with Banks and Money at Call and Short Notice		
I. In India		
i) Balances with banks		
a) in Current Accounts	37,948	47,271
b) in Deposit Accounts	NIL	152,000
ii) Money at call and short notice		
a) With banks	NIL	NIL
b) With other institutions	NIL	NIL
TOTAL	37,948	199,271
II. Outside India		
i) In Current Accounts	882	44,414
ii) In other Deposit Accounts	NIL	NIL
iii) Money at call and short notice	NIL	NIL
TOTAL	882	44,414
GRAND TOTAL (I + II)	38,830	243,685

BOMBAY BRANCH

Schedule 17—Notes on Accounts

I Principal Accounting Policies

1 General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

2 Transactions Involving Foreign Exchange

i Monetary assets and liabilities have been translated at the exchange rate prevailing at the close of the year except foreign currency deposits under certain schemes which are translated at notional rates Non-monetary assets have been carried in the books at the contracted rates

ii Income and expenditure items have been translated at the exchange rates ruling on the date of the transactions

iii Outstanding forward contracts have been revalued at the forward exchange rates prevailing at the close of the year

3 Investments

i The investments in approved securities are classified into "Permanent" and "Current" investments in terms of guidelines of Reserve Bank of India.

ii Permanent investments are valued as under

– If the cost of acquisition is less than face value–at cost.

– If the cost of acquisition is higher than face value – the carrying cost is arrived at by amortizing the premium over the period of maturity

iii Current investments have been valued at lower of cost or market value For the purpose of valuation, Reserve Bank of India/Stock Exchange quotations where available have been taken as market rates, and where the rates are not available the same have been valued as per norms laid down by Reserve Bank of India as under

a. Government Securities and PSU Bonds	Valued on yield to maturities (YTM) basis
b Treasury Bills and investments under ready forward transactions	Valued at carrying cost

iv The broken period interest on purchase/sale of securities is treated as capital outlay/receipt

4 Advances

i Provision for 'Non performing assets' is made on the basis of the asset classification and provisioning requirement thereof under the prudential norms laid down by the Reserve Bank of India including those with outstanding balance of less than Rs 25,000/- per borrower Advances secured by Financial Guarantees of public sector banks are not considered "Non Performing Assets"

ii Further provision is made for doubtful advances based on Management's estimate of potential exposure

iii Provisions in respect of doubtful advances have been deducted from advances to the extent necessary and the excess has been included under Other Liabilities and Provisions"

iv In consortium advances, the accounts are classified as per the decision of the lead bank

v Advances are shown net of bills discounted with the Financial Institutions

vi Interest on non-performing advances is accounted as per the guidelines of Reserve Bank of India with reference to realisation

5 Fixed Assets

i Fixed assets are accounted for at their historical cost.

ii Depreciation is provided for on the written down value method at the rates prescribed in Schedule XIV of the Companies Act, 1956

6 Staff Benefits

The liability for Gratuity to staff has been computed and provided on actuarial basis

7 Net Profit

The net profit disclosed in the Profit and Loss Account is after

i Provision for taxes on income in accordance with statutory requirements

ii Provisions on advances

iii Provision for Head Office administration expenses

iv Other usual and necessary provisions

II Changes in Accounting Policies

1 Provision for advances with individual outstanding of less than Rs. 25,000/- has been made this year at 7.5% of the aggregate amount outstanding as per the prudential norms laid down by Reserve Bank of India as against 5% in the preceding year

2 Till the preceding year permanent investments were carried 'at cost' In accordance with guidelines issued by the Reserve Bank of India the premium over the face value has been amortized during the year

3 The impact of these changes on operational results for the year is not material

III Revenue and Other Reserves

1 Include Head Office Reserves of Rs. 33,255,656/- which represent funds remitted by Head Office/retained from repatriable profits to meet the cost of acquisition of residential premises, deposit/advance licence fee of Bank premises at Bombay, etc as per guidelines of Reserve Bank of India.

IV Other assets include share application money Rs. 10,000,000/-

V Profit on exchange transactions include Rs. 9,500,627/- arising out of refinement of basis of foreign exchange translations.

VI The previous year's figures have been regrouped/rearranged wherever necessary

BOMBAY BRANCH

Auditors' Report on the Accounts of the Bombay Branch of Abu Dhabi Commercial Bank Limited

We have audited the attached Balance Sheet of the Bombay Branch of Abu Dhabi Commercial Bank Limited (incorporated in the United Arab Emirates with Limited Liability), as at 31st March 1995 and the Profit and Loss Account of the Bombay Branch of the Bank for the year ended 31st March 1995 annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of Section 211 and Sub Section (5) of Section 227 of the Companies Act, 1956.

We report that:

(1) we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of the audit and have found them to be satisfactory;

(2) the transactions which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank;

(3) in our opinion, proper books of account as required by law have been kept by the Bombay Branch of the Bank so far as appears from our examination of these books;

(4) the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;

(5) In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, read with notes there on, particularly Note II regarding changes in accounting policies give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March 1995 and of its profit for the year ended on that date.

History Outside the Nation

Nira Wickramasinghe

The privileging of the narrative of nation-as-history in post-modern historiography has overshadowed how people conceive time in terms other than nation

THIS essay comes as a response and a reaction to K N Panikkar's recent essay 'In Defence of Old History' (*EPW*, October 1, 1994) where he puts forward an incisive critique, albeit from a predictably Marxist perspective of 'post-modern history'. The core of his argument is that by conceiving history as representation, without the possibility of ever knowing the truth, post-modern histories are engaged in the same historical project as colonialism which is to deny a history to the subjected. Panikkar's critique is particularly important when he points out that caste and communities that were the weapons in the colonial armoury to ensure the perpetuation of political power are invoked by neo-colonial history as the only valid categories to interrogate reality. I would add here that in post-modern histories the most important category invoked is by far the nation/modernity.

All histories are not nationalist histories and an investigation of the nation-state, its failures and its strengths is not the only way of addressing history. Today there is an uneasy alliance, sometimes even a curious complicity, between those who build nation-states through history writing and those who deconstruct their oeuvre. The terms of reference are defined by the warriors on each side. Histories which include the voices of those who before were condemned to silence in an elitist history still posit the nation-state or the nation as a reference point. Those who criticise the nation-state refer to it continuously, take position *vis-a-vis* it, while multiple histories of people lie untouched under the coating of nationalist histories.

My essay, which stemmed from reading Panikkar, aims at suggesting the idea of a 'history outside the nation' and the primacy of 'temporality' in history as a possible way-out from the impasse of uncertainties to which post-modernism has drawn history writing.

I
Time in History

The subject matter of history, what makes history, is an area of contention. History can no longer be defined as a series of events or cognitive points arranged in the order of chronology. In the last few decades, post-modern critiques of history writing have questioned, quite legitimately, the autonomy of the 'event'. Events, they argue, do not exist *per se*. Consciousness – which varies from agent to agent – acts as mediator. They have also questioned "the sequencing, the causal assumptions that underlie selecting and framing the events, the theoretical understanding that sanctions that selection and framing of events, the adoption of an appropriate vantage point and the authority that authorises that vantage point" [Crapanzano 1992]. They have taken a 'nihilistic delight' in the impossibility of any universal understanding, any incontestable truth. History, continuity, memory have been subverted as meta-narratives that legitimised science, while other totalising visions too crumbled before our eyes. Thus, one can, to a certain extent, laud the post-modern enterprise for having radically altered history by the changes in discourse that were postulated.

Today, however, this discourse forms a new sort of orthodoxy which few have the courage to contest. Instead of events we have texts representing the French Revolution, or narratives of the foundation of Islam which each and everyone will read in a different way. The Rashomon effect of the dialogically open-ended, self-questioning, multi-perspectival histories often means that anything is possible as egalitarianism prevails at the discursive level. Most post-modern thinkers come from literary or anthropological backgrounds where 'time' is not the subject of investigation. For them, just as for me, history as a sequential process ordered by time is problematic. But when Foucault and Deleuze question the validity of any possible notion of linear time and challenge in a Heideggerian vein a notion even of empirical history in which events follow one after the other as causes and effects, their concern is with societies where circular time is anathema [Faucault 1972; Deleuze 1972]. Their own conception of time where events float haphazardly in a veritable sea of contingency – a notion which is not part of the European heritage – is less ambivalent in societies such as ours which recognise that time is as malleable as the clocks in Dali's painting. The question I ask is this: Is it then necessary or indispensable that we historians studying South Asia put aside notions of 'before' and 'after' under the pretext that they suppose an order which does not exist, an overarching march of history? Is it necessary for us to deconstruct our time and history when our time is already fluid, circular? Must we like the Mad Hatter in 'Alice in Wonderland' kill time?

Time is the most important denominator in any history writing and history is, I believe, the science of the consciousness of time. Even a history of the fragments, even a history which is primarily interested in ideology must acknowledge time. Just as there is a today, there was a yesterday and there will be a tomorrow. This is what history, whether linear or circular is all about.

One can wonder whether time is a concept, a series of concepts or just a set of measurements? If one follows Leibnitz, things are quite transparent: 'time is the order of non-contemporaneous things'. More recently, anthropologists have looked at the time of cultures and focused their attention on time as a marker of social transformation. They have shown us that there are different ways of understanding ideas and experiences of temporality. Furthermore, one can speak to a certain extent of the objectivity of the historical fact, event, or of a particular period for the historian. It arises from an awareness not of the event itself but of the ruptures in time (past, present and future) which places it, at the time of its occurrence, in the present, and assigns it an associative relation with absolute time. All historical facts, with or without a specific date, possess a past and a future, both of which are independent of observation. For example, the foundation of Buddhism is an event since there is a pre-Buddhist India and a post-Buddhist India. As Chaudhuri writes, "historical events, structures or phenomena can be grouped into different classes of time which have different qualitative properties, different 'frequencies' and unequal power" [Chaudhuri 1990].

Thus, Chaudhuri and other structuralists take a different path, a path where some answers are possible, where time is the time of the historian, thus, objective and knowable. But like most structuralists, Chaudhuri fails to make a distinction

between measuring time and concepts of time. Just as Braudel, Chaudhuri writes of a time which is the time of the historians rather than of society's consciousness of itself. Both tend to posit an unconstituted objective world where time can be measured. This is a legitimate criticism. However, if like Maurice Halbachs, we agree that there are as many collective notions of time in a society as there are separate groups, and we deny that a unifying time could be imposed on all groups simultaneously, cognitive reflection is suspended [Halbachs 1947: 3-31]. Just as there is no possibility of unifying time, there is no possibility of thinking about it, as Ricoeur asserts: 'Human thought has not produced a universal system of categories capable of embodying a personal experience of time and history itself having a universal validity'.[1] The historian is thus left to think of the particular. What s/he must come to terms with is that the linear history, which as an adept of post-modernism s/he is eager to deconstruct, is in fact the history imagined along those lines by a small group of people whom s/he has chosen to privilege in his/her study. What I suggest is that it is the obsessive concern in South Asian academia for the nation and the modern that leads us to look at history through one small lens and privilege an interpretation of history (history as history of the nation) which has little bearing on the consciousness of the people.

II
History Outside the Nation?

The contention by well meaning, progressive thinkers that history always means nationalist history has led to a self-immolatory surge among historians. The nation and how it had been read, written about, vilified and adored has become the single question of the historian. This included nationalist historians, colonial historians as well as post-colonial subalterns, eager to retrieve the fragments of the nation or deconstruct the nation. In Sri Lankan academia quite clearly, nationalist historians as well as revisionist scholars, preoccupied with the pressing issue of legitimising and delegitimising the nation-state in its present form, have rarely concerned themselves with the way in which ordinary people at given time made sense of the world, how they construed the world, invested it with meaning and infused it with emotion. How they lived their relation to the past, the present and the future; in short, how they constructed their history. Many anthropologists have placed emphasis on deconstructing what makes up the canonical text of Sinhala nationalism, 'the Mahavamsa', without attempting to assess to what extent the Mahavamsa was known to common people during the pre-colonial and colonial periods. Some have suggested that before the translation of the Mahavamsa into Sinhalese in 1837, there was no concept of history as it is understood in the west. Rogers' work on 19th century Ceylon, for instance, has shown that the images of the past that developed in the British period were produced by using 19th century western historical ideas and methods [Rogers nd: 88-102]. The central idea of historiography, the rise and decline of an ancient civilisation, was almost universally accepted, both because it was plausible – it was confirmed by both the Mahavamsa and the ruined irrigation tanks and cities – and because it was consistent with the pattern of Europe historically which looked to the classical civilisation of Greece and Rome. Later, Sri Lankan writers pointed out that Sri Lanka's civilisation, although weakened, had maintained its cultural continuity. My purpose is not to contest these valuable studies but to question the centrality of 'history' borne out of canonical texts or critical appraisals of these canonical texts. The images of the past that emerge from the writings of Rogers and other deconstructors of canonical texts, portray the views of a very marginal group, i e, the literate elite of the time. It is, indeed, as most scholars have shown, a view totally in consonance with the understanding of history prevalent in the West. But it is, nevertheless, the view of a few. What historians should question is whether the rest of the people did not think of history as history of the nation, whilst they were conscious of temporality, of a past, present and future. Their world-view has not been adequately considered. Perhaps they did not have a modern concept of history but their life/time was ordered and sequential whether in a linear or a circular manner. This is apparent in Sinhalese grammar where the three tenses, past, present and future, provide a structural order. Thus, when speaking about histories of people and of their understanding of the past as a *sine qua non* for the emergence of a nation, is it not crucial to uncover their cosmology and at the centre of their cosmology the way they lived and thought 'time' at given moments? What were, for instance, the analytical categories available to the people when they wanted to measure time, quantify it and then record it in their tales, songs and sayings, thus 'writing' history?

Rather than privileging, as the post-modern critiques of history have, canonical histories, written texts composed in a linear mode as objects of analysis, it might be time to forget the nation and the nation as history and turn our inquiring mind to 'temporality' as the thread of history.

It is my contention that communities are made more by common folktales, habits, idiosyncratisms, common perceptions of time rather than by common imagined histories, common efforts to oust colonial rulers or modern ideologies of the nation and the downward seepage of ideas. A history from within would take into account the way in which time was experienced by its actors and stress the importance of an autonomous concept of time in the forging of a people's or community's history. The question which must be addressed is whether it is possible to have a people (nation) without a national history. I would venture to propose that the concepts of time and memory are central to the question. Time was present in Sinhalese folktales but, it was not the time of the Mahavamsa or of later state-building histories. It was rather the time of the peasant, linked to the stars, the moon and the opening of flowers. Superimposed on a national history, on a history of kings and queens, battles and invasions were temporal continuities which had their own measures, discourse and moments of tension and breaks and also, their own heroes, sometimes mythic figures, a people's history, autonomous, separate, oblivious to nation-building.

III
Post-modern Historians and Writing of Texts

Pannikar's essay eludes one aspect of a critique of post-modern histories. Post-modern historians have not deconstructed the mode of history writing. Like docile bodies, they abide by the rules set, and enshrine some oeuvres, just like their predecessors enshrined their own canonical historical oeuvres. Canonisation prefigures the death of history. Today's historian who has studied history at the university is expected to produce written texts which s/he then reads at seminars and international conferences, and which s/he formats and footnotes according to the Chicago manual of style before submitting them to a journal. Only texts legitimise his existence. Without them s/he is like a painter who does not paint. But the historian is still not free in his creations. The texts he produces, even today, must be based on exemplary works or models which form the canon of the discipline of history. Unlike in anthropology where the critique of the canon has been absorbed, in history the

textual canon remains strong. Will *EPW* publish an article written in surrealist verse or composed in the form of a Platonic dialogue? From Colombo to Cambridge, from Chicago to Tokyo, historians obey an unwritten code.

Post-modern historians have, however, succeeded in undermining two fundamental precepts of mainstream history writing (although Sri Lanka's historians are still oblivious to these developments). The first age-old precept is that the argument of the text has to be distilled from a complex/narrative text (mainly archival sources) and then debated, detached from and free of the text. The second precept is that only what conforms to the canon will be focused upon and included in the canonical historical body. This means in effect excluding anything produced by anthropologists or literary historians. The discipline rests on an 'esprit de corps', on a history written by historians. The work of a historian is not looked at by his guild as an oeuvre that invites various interpretations or alternative readings. Rather, what is discussed and debated are considered the arguments, the 'truths' that inform it and are distilled from it. Historical work is neither read nor written as a narrative because most working/writing historians still view history as a meaningful account of the past rather than a positioned narrative [Marcus 1992].

This is not so of anthropologists and sociologists who write histories. Nor is it the case of the subaltern studies historians who originally wanted to rectify the bias of elitist historiography and neo-colonialist historiography that credits the making of the Indian nation and the development of a national consciousness to British colonial rulers, administrators, policies, institutions and culture, and not to Indian elite personalities, activities and ideas. These new histories are, however, written in a language that only the members of an elitist guild can comprehend. The new canons, the new orthodoxy of post-modernism has shut away the very people who were condemned to silence and whom they hoped to draw out from the blind alleys.

My hope is to see one day historiography, which is neither the biography of the nation nor a critique of the modern, speaks in words a child will comprehend. At a time when we indulge in variations on the motives of the symphonies composed by Foucault, Derrida, Bourdieu and Anderson, my hope is that historians will consent to lower themselves and write a fugue.

DEVELOPMENT INTERVENTION AND PROGRAMME EVALUATION:

CONCEPTS AND CASES

edited by **Vijay Padaki**

This book combines academic rigour with practical applications and is an interdisciplinary exploration of alternative models in Programme Evaluation. It confronts the major issues involved in bringing Programme Evaluation into development interventions, while testing the validity of the alternative framework through a set of case studies. It will be of considerable interest to a wide range of readers including policy makers, programme administrators, funding organisations, programme implementors, activists and NGOs, evaluation researchers and social scientists.

DEMOCRACY, COMPETITION AND CHOICE

Emerging Local Self-Government in Nepal

John Martinussen

This book reviews the new policies on decentralisation in Nepal and investigates how and to what extent they have so far been implemented. Major obstacles at the national and local levels are identified, and proposals put forward for more efficacious decentralisation strategies aimed at strengthening the new local authorities within a democratic framework.

India as a Regional World Economy

Kanakalatha Mukund

Indian Merchants and Eurasian Trade 1600-1750 by Stephen Frederic Dale; Foundation Books, New Delhi, 1994; Rs 240, pp xiv + 162. (Cambridge Studies in Islamic Civilisation).

THIS slender volume turns its attention to what is genuinely a neglected aspect of India's mercantile history – the extensive diaspora of Indian merchants who lived and traded in Iran, Central Asia (Uzbek Turan) and Russia. Dale is the first historian after Surendra Gopal to venture into this area of history, and by highlighting the long-standing presence of Indian merchants in Iran and Turan, Dale adds to Gopal's contributions. Dale argues that the mere term 'diaspora' does not convey the extent of the trade of the Indian merchants, nor their economic significance.

"This particular diaspora reflected an asymmetrical economic relationship in which Indians marketed agricultural products, textile manufactures and their own financial expertise throughout a broad region where they enjoyed a competitive advantage in both goods and services – or, in visible and invisible exports. In brief, the diaspora manifested in the persons of these merchants the Mughul empire's stature as a regionally dominant economic power, or, in Fernand Braudel's phrase, a regional 'world economy'" (p 2).

Dale argues that the three contemporaneous Islamic empires of Mughal India, Safavid Iran and Ottomon Turkey established a fairly effective *pax Islamica* which provided the necessary precondition of political stability to facilitate trade. There was also a substantial degree of homogeneity in the commercial and linguistic environment which enabled the Indian merchants to trade in Iran and Uzbek Turan. Dale also stresses a relatively little appreciated facet of Mughal economic policy, namely, the active promotion of commerce through time-honoured measures like the development of infrastructure – roads, bridges, caravanserais, etc – as well as through the protection offered to caravans and merchants, removing internal barriers to trade and protecting the fundamental right of private property. This comes as a welcome corrective to the more prevalent notion of the extortionate and exploitative nature of the pre-modern states in India and the rapacious unaccountability of local officials. The volume and range of internal and external trade would intuitively negate this assumption, which Dale strengthens by quoting both Islamic law as well as Abul Fazl and other sources.

Mughal India was the most prosperous of the three regions in its economic resources – agriculture, manufacturing and population. The total value of its major exports of cotton cloth, indigo and sugar far outweighed the total value of imports from Iran and Central Asia, of which the most valuable were horses. The Mughal empire had a favourable net balance of trade which was paid for with exports of bullion from Iran and Turan, which was one more channel through which precious metals flowed into India till the 18th century. These advantages gave Mughal India a dominating advantage over the other two regions, and also allowed the Mughal Emperor the luxury of following what was virtually a *laissez-faire* foreign trade policy as compared to Shah Abbas of Iran who had instituted a kind of state capitalism to protect the more fragile economy of his country.

The Indian merchants trading in Iran, Turan or Russia were known generally as Multanis, but they comprised three major ethnic groups – Punjabi Khattris, Marwaris and Pushtu Afghans. Trading through family-based networks, they had penetrated into Central Asia and were, for a short time, even visible in Moscow. Though later often criticised as usurious moneylenders, Dale establishes that they were able to provide much needed financial services and credit in regions where Islamic law tended to hamper indigenous groups in engaging in such services. These merchants were quite visible and viable till well into the 19th century, and their decline came about at least partly as a result of the changing patterns of world trade, as for example when British cloth overtook Indian textiles in world markets.

Dale also contributes to some of the existing debates about the nature of merchants and mercantile organisation. He makes the interesting observation that the often repeated comment that the Indian merchant was only a 'peddler' is valid only if he is compared with the European East India Companies. This does not recognise that even in Europe these companies were exceptional, and that, by and large, European merchants, especially in the Mediterranean regions, operated as individual or family-based units.

The only criticism that I would make is in Dale's treatment of other economic historians, whom he classifies without exception as being 'Euro-centric' – almost a term of academic abuse, and one, which it is clear, a scholar ought not to be. Dale does not seem to be aware of the work of other historians, especially Dasgupta, Arasaratnam, etc, who all take exception to the 'Euro-centric' view. Dasgupta, for instance, is often criticised for expressing an extension of Dale's own viewpoint about the importance of the stable political environment created by the three major Islamic empires of the region for the expansion of trade, and that the decline of Surat as a major port was due in a large part to the degeneration of these empires. This jarring note apart, this is an interesting and scholarly work, and a good addition to our knowledge about India's pre-modern economic history. Its distinctiveness lies especially in the use of Persian and other hitherto unused Russian sources.

Women and Environment

Dolly Arora

Environment, Development and the Gender Gap by Sandhya Venkateswaran; Sage Publications, New Delhi, 1995; pp 234, Rs 250.

RECENT years have seen the emergence of women as an important category on the agenda for social research. This is especially so in the field of environment and development studies. A large number of studies have looked into specific activities, problems and policies with reference to women as their mechanisms, victims or beneficiaries. The book under review is another addition to the range of such works.

That women play a predominant role in activities relating to natural resources and that the degradation of these resources in turn has a disproportionate effect on women is fairly well established by now. And the author admits this at the outset. It is not surprising to find the book relies so heavily on several of the existing studies in this domain. The single most important accomplishment of the book, in fact, is to introduce the reader to a wide range of existing literature in the arena.

The book attempts to outline women's role in the management of their environment and the impact of policies, or lack of ecologically sound policies, on their work roles and status (18).It also profiles some of the government and NGO responses to ecological needs and therefore related women's needs. Claiming to "look more critically at the category `women'" the author contends that the relationship between women and environment could vary considerably across women of different socio-economic groups or categories of the population. The close association between women and natural resources, she argues, is valid primarily in a rural context, and especially among women of less affluent families. And this is primarily because of their social and economic roles, which over generations have required them to provide food, water, fuel, fodder and income from the surrounding resource base. Fulfilling these roles has given them a special understanding of natural resources and led them to adopt a more sensitive attitude towards them. The consciousness of those women, who are admittedly the primary concern of the book, is different from that of men's, as also from that of rural women of affluent households who do not typically carry out these roles. Hence the argument that women's consciousness of the environment should not be considered as something inherent, arising out of their being women.

The relationship between women and environment is addressed not merely because women are perceived as victims of environmental destruction, but because despite the roles traditionally played by them in the management of natural resources, and the knowledge base they possess based on which these roles are carried out, they have now been almost completely marginalised from the processes that seek to formulate strategies for use and management of these resources. More significantly, in the process women have further lost status and power, by losing access to resources as well as control over their labour and knowledge (14).

The book attempts to discuss a wide range of issues related to croplands, common lands, forest and water resources, domestic energy, social forestry, technology, urban environment and pollution, as these affect women and as these have been addressed through government programmes and non-governmental efforts.

The chapters could certainly be better organised than they are. Thus, while 'Forests' and 'Social Forestry', are discussed in two separate chapters, 'Livestock Management', and 'Dairy Development' form part of the chapter on 'Common Lands'. 'Domestic Energy', however, is dealt with separately; and there are separate chapters on 'NGO Experiences' and 'Government Efforts' respectively, in regeneration and development of wastelands, although each chapter also incorporates both NGO initiatives and government efforts in concerned areas.

The author has indeed placed at the disposal of readers a lot of information on diverse aspects of problems affecting women both as a result of and despite development policies. But reader will need to put in considerable effort to interpret this information and arrive at some kind of an understanding about the problems and possibilities of dealing with them. The book is far from being a help in this respect. For it does not go very far in analysing the myriad problems with environment or development which have been shown to affect women most. In fact, there is little by way of an assessment of the relationship of these problems to the general orientation of economic policies. Nor does one find any critical evaluation of the solutions offered either by the government or by the NGOs in response to women's problems being addressed. The author does not even attempt to assess the relevance or insignificant import of these policies and programmes in terms of their capacity or incapacity to alter the overall context which generates and sustains such problems.

Some of the chapters are rather superficial in that they provide neither a complete picture of the issue being discussed nor any effective analysis of the problems involved or solution offered. The chapter on global perspectives, for instance, suggests that while it is true that environmental problems vary depending on the degree of development and the structure of the economy, development, and consequently the environment, are nevertheless global issues. And then it simply tries to provide evidence to the effect that issues relating to women and environment were raised at international forums too, and that these reached their peak in 1992 at the UNCED conference and the Global Forum of NGOs at Rio. The author also provides a brief outline of the Women's Action Agenda 21 adopted by around 1,500 women from across the world who gathered at Miami. This four-and-a-half page chapter above comes to an end with the information that to implement some of the decisions adopted at Rio, the government has drawn up an action plan for the country.

There is no discussion of various conflicts which have characterised the position of women from the north and south respectively; nor any critique of the programmes so adopted from the perspective of rural women who suffer various aspects of environmental degradation. One does not find any mention of the implications of the global development models being promoted by international agencies like the World Bank and IMF on the worsening state of environment and women. Nor is there any concern for actually evaluating the actual implications of programmes of action advocated at such forums for the state of women in countries like India. The contrary implications of various perspectives offered at different international fora, or even at the same fora but in the context of different policies need to be carefully looked into if at all one is to understand or respond to these so-called global perspectives. The book under review shies away from any such exercise.

While there is an admission that benefits of resources, knowledge and environmental policies in developing countries often accrue to developed countries, the author seems to believe that the technologies needed by developing countries often lie with the developed countries. It is this understanding which leads the author to suggest that environmental problems existing in some countries may be linked to the practices and

policies of others (219). The direct costs inflicted on the people of developing countries by the development policies in the developed world are simply not talked about. This silence does not go well with a concern for the real state of the marginalised, especially women victims of environmental problems.

In the chapter on 'Gender and Technology', the author states, "As a result of being extensively involved in certain tasks, over the years women have built up a vast resource of technical knowledge on aspects of agriculture, forestry, livestock, water use and various other areas of their activities. This pool of knowledge relates to optimal methods of performing tasks and to optimal use and management of resources, as it has evolved over generations of performing the same tasks" (168). And she substantiates her argument with the help of evidence generated by several field studies. Technological innovations have affected women in varied ways, but seldom worked towards improving the quality of their lives. Often new technologies have displaced women from their traditional areas of employment, while leaving the activities where women predominate untouched, as in the subsistence sector (165).

But she feels that attempts have been made to address the technological needs of women – a few projects supported by the department of science and technology have been mentioned to support this claim. These are related to such objectives as upgradation of skills in areas such as poultry and quail farming, training in conservation of soil and moisture by planting specific types of plants, or maintenance of conventional and non-conventional sources of drinking water, etc. Far from examining how these initiatives relate to or respect women's traditional knowledge, she goes on to suggest that every technical change necessarily needs to be accompanied with changes in attitude, values and beliefs of the people who are affected by such change. The community at which the technology is directed, needs to be educated and trained, so that it becomes easier for them to accept the new technology (173). These suggestions are offered when the author herself has shown chapter after chapter, with the help of existing studies the numerous negative effects of various technological innovations.

The book nevertheless puts together ample evidence to suggest that policies and programmes adopted to manage the environment have affected women quite adversely – in relation to their workload, social status, health as well as general well-being. From the problems created by the HYV technology or deforestation, to those generated by development projects or water management policies, to those resulting from various kinds of pollution, the book enlists numerous instances to present a strong case for being sensitive to women's needs.

When, however, it comes to identifying possible ways of dealing with this situation, the author stops short of questioning the model of development which has given rise to these problem-infested policies in the first place. Operating within the framework of this model, she advocates a greater integration of women into policies and programmes, and for the purpose suggests that all existing programmes should be assessed in terms of their impact on women and findings be used as an input in policy formulation. Given the fact that the very model of development and its attendant policies are inclined to throw up ever newer problems for women, one wonders how only programme-centred responses can be expected to take care of the needs and concerns of women.

Women's non-involvement in government progammes is perceived to be the major reason for the failure of programmes to fulfil their 'original purpose'. For, when women have been integrated into these programmes, apart from the fact that their direct needs of income or drudgery reduction been addressed, she asserts that they have gained in confidence, in status and in finding a voice to articulate their concerns, views and problems (224). And since there is evidence that women find a voice and strengthen through collective action, their involvement in programmes, it is suggested, should be propagated through local women's groups (225).

Collective action is thus valued for its potential to facilitate women's integration with government programmes. And NGOs are expected to play a role in this regard. For the author is content with their capacity to provide these groups with the kind of support that is required to create the necessary consciousness among women. Not only does the faith placed in the intent and 'original purpose' of government programmes appear to be more than justified by the reality of these, one is also left wondering if the hopes placed on the NGOs are not due to an oversimplistic perception of the possibilities of handling complex policy-related problems through project-based initiatives or interventions. The entire reality of policy problems emanating from power dynamics thrown up by the structures of patriarchy as much as globalisation is in effect dismissed when women's problems are finally attributed to factors like lack of consciousness, literacy, and confidence, which NGOs are expected to help generate. A number of issues have been completely ignored while the author lists her conclusions and emerging concerns. One wishes she had not been in such a hurry to conclude.

Schedule 17—Notes Forming Part of the Accounts for the Year Ended 31st March, 1995

1. **Principal Accounting Policies**

1.1. General

The accompanying financial statements have been prepared according to the historical cost convention and conform to the generally accepted accounting principles and to the practices prevailing within the banking industry in India

1.2. Foreign Currency Translation

a) Assets and liabilities in foreign currencies as well as outstanding forward exchange contracts are revalued at the appropriate year end rates as specified by FEDAI and the resultant gains or losses have been taken to the Profit and Loss Account

b) The balances held under the Foreign Currency Non Resident [A] deposit scheme are stated at the rates specified by the Reserve Bank of India from time to time.

c) Outstanding forward exchange contracts have been disclosed as contingent liabilities at the contracted rates.

1.3. Investments

a) The Bank's entire investment portfolio has been treated as "Current Investments" and the same has been valued at the lower of cost and market value in aggregate, categorywise, as per the guidelines issued by the Reserve Bank of India.

The market value for this purpose has been ascertained on the basis of the "Yield to Maturity" method wherever reliable Stock Exchange quotations are not available.

The cost for this purpose is the cost of acquisition and in case of Zero Coupon Bonds, includes discount accrued over the remaining tenure of the security.

ABN·AMRO Bank N.V.

INDIAN BRANCHES

(Incorporated in the Netherlands with Limited Liability)

b) Commercial Paper and Treasury Bills have been stated at carrying cost i.e. cost of acquisition plus the discount which is accrued over the tenure of each such security.

1.4. Advances

Advances are stated in the Balance Sheet net of specific provisions for bad and doubtful debts, which are made based on a periodic review of advances and are to the satisfaction of the auditors.

1.5. Fixed Assets

a) Fixed Assets are stated at historical cost less accumulated depreciation. Cost for this purpose includes written down value as on March 31, 1991 for fixed assets acquired on or before March 31, 1991 and cost of acquisition for fixed assets acquired after March 31, 1991.

b) Depreciation is provided as per the written down value method on a *pro rata* basis at the rates in line with Schedule XIV of the Companies Act, 1956.

1.6. Staff Benefits

Provision for gratuity and pension benefits to staff (inclusive of provision for past service liability) has been made on the basis of actuarial valuation. Separate funds for gratuity and pension have been created and the contributions payable (inclusive of contribution for past service liability) have been paid to respective funds.

1.7. Income Recognition

Interest income is recognised on an accrual basis except in case of non-performing advances where it is taken to the Profit and Loss Account on receipt.

1.8. Provision for Taxation

Provision for taxation has been made on the "liability method" of accounting which is generally followed in India.

1.9. Net Profit

The net profit disclosed in the Profit and Loss Account is after:

a) Provision for taxes on income in accordance with statutory requirements.

b) Provision for doubtful advances.

c) Other usual and necessary provisions.

2. **Other Notes**

2.1. Head office charges reserves consist of amounts payable to Head Office for allocated charges which the Head Office intends to retain in India to meet capital adequacy requirements.

2.2. The previous year's figures have been regrouped/rearranged wherever necessary.

Auditors' Report on the Accounts of the Indian Branches of ABN AMRO Bank N.V. under Section 30 of the Banking Regulation Act, 1949

We have examined the Balance Sheet of the Indian Branches of ABN AMRO Bank N.V. [Incorporated in The Netherlands with limited liability] as at 31st March, 1995 and the related Profit and Loss Account for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Sub Sections (1), (2) and (5) of Section 211 and Sub Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon, are not required to be and are not drawn up in accordance with Schedule VI of the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that read with the foregoing remark:

A. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit, and have found them to be satisfactory.

B. In our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books.

C. The Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.

D. In our opinion and to the best of our information and according to the explanations given to us the said accounts read with notes thereon give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31st March, 1995 and Profit and Loss Account gives a true and fair view of the profit of the Indian Branches for the year ended on that date.

Restructuring the Tax System in India

A Reappraisal of Key Issues

K Sundaram
V Pandit
B Mukherji

In considering a switch over to value added taxation or any of its variants, what is of fundamental importance is the effect on resource allocation in the economy and resource transfer to the government. This implies that what needs to be considered is the revenue that is generated under alternative systems and the structure of absolute and relative prices associated with each.

This paper examines the central issue of revenue neutrality and relative prices under alternative tax systems and clarifies the phenomenon of cascading. In analysing the issue of cascading, the authors distinguish between a pure exchange or trade model and model of production with produced inputs subject to taxation.

THAT the system of indirect taxation in India is urgently in need of reforms is hardly disputed. Expansion of the tax base, reduction in evasion, simplification of rules to bring about transparency and efficiency should obviously be the objectives of any tax reform policy. However, the achievement of these objectives is more or less independent of the mode of tax collection or the base on which tax obligations are calculated. This is so for two reasons. First, the factors which have resulted in unending legal disputes, inefficient enforcement, large-scale evasion, etc, are not due simply to the mode of taxation. This being the case, the view that a switch over to the value added taxation (VAT) is the panacea for all aforesaid problems is clearly untenable. Secondly, expansion of tax base by bringing services within the purview of taxation, simplification of rules, efforts at bringing about greater harmonisation of tax rates across states and other similar reforms need not be and are not tied to a switch over to VAT.

What we consider to be of abiding and fundamental importance in consideration of a switch over to VAT or any of its variants is the effect it has on resource allocation in the economy and resource transfer to the government. This implies that what needs to be considered is the revenue that is generated under alternative systems and the structure of absolute and relative prices associated with each.

Another issue that has come in the way of a proper assessment of alternative tax systems is the question of cascading. This is widely identified as a major defect not only of the central excise tax regime in operation in India until recently but also of the system of sales tax currently in operation at the state level. As we shall show presently, there is considerable confusion as to what constitutes cascading and the situations under which such cascading occurs.

This paper seeks to examine carefully the central issue of revenue neutrality and relative prices under alternative tax systems and to clarify the phenomenon of cascading. In both cases, the focus will be on a clearer understanding of the issues.

In analysing the issue of cascading, we distinguish between what we call a pure exchange or trade model (Section I) and a model of production with produced inputs subject to taxation (Section II). This is followed, in Section III, by a discussion of the question of revenue neutrality and relative prices under alternative tax systems. Brief concluding observations are presented in Section IV.

I
A Pure Trade Model

Let us consider first the case where no produced inputs are used. A simple illustration of such a situation would be a chain of pure trading transactions where a person with an exclusive control of a natural spring sells the water at a profit to a wholesaler who sells it to a retailer who in turn sells it to the final consumer, with the wholesaler and the retailer, each, collecting a profit. This is, in fact, the model underlying a numerical example given in the NIPFP 1994 report, *Reform of Domestic Trade Taxes in India: Issues and Options*, subsequently referred to as the Report, to illustrate the phenomenon of cascading.[1] (Table 2.2, p 10 which is reproduced here as Appendix I, Table A 1.) Before proceeding to examine the question of cascading in such a model of pure exchange, notice that the profits collected by the owner of the spring, the wholesaler and the retailer constitute the value added. It would, of course, be possible to introduce labour costs or wages paid to the workers at each stage, without altering the essential character of a pure 'trade' model.

Let us begin with the simplest case of a first point Sales Tax (FST). It is useful to consider this case because, there is sometimes a tendency to lump this with turnover taxes (TOT) and consider both to have the same property of cascading. In Table 1 we present a simple numerical example of price build-up from the initial producer to the final consumer under a 10 per cent *ad valorem* first point sales tax. To judge the price and tax revenue outcomes in this case (and in other cases), we construct a parallel exercise under a value added tax – also levied at 10 per cent *ad valorem* (Table 2).

A comparison of Tables 1 and 2 will show that the final price to the consumer under VAT is higher than under a simple first point sales tax. This, of course, does not imply that there is any cascading under VAT. For, the difference between the price under VAT and that under a first point sales tax is fully accounted for by the change in value added (in this case, profits) and the change in tax revenue. We have:

264.275 – 247.5 = (240.25 – 237.5)
+ (24.025 – 10)

It must be stressed that the fact that profits (value added) are higher because the multiplicative mark-up is being applied on a higher, tax-inclusive, price at the preceding stage is irrelevant to an assessment of the presence or absence of cascading. It is also easily seen that the higher level of profits (and, therefore, value added) under VAT arises simply from the multiplicative form of the mark-up. If, instead, we were to assume that the mark-up is additive, in the sense that it is a fixed amount per unit, there will indeed be no difference in value added (read profits) under the two cases[2].

A comparison of Tables 1 and 2 also brings out a more valid critique of the FST In order to generate the same revenue under FST as under VAT, the tax rate under the former will need to be higher which in turn may induce greater tax evasion

It might be argued that even though FST does not cascade, TOT do In order to examine this, we construct, under the same set of initial conditions and assumptions about profit mark-up, another numerical example – this time with TOT levied at a uniform rate of 10 per cent *ad valorem* (Table 3)

A comparison of Tables 2 and 3 shows the price to the final consumer to be higher (Rs 299 475) under a TOT that under VAT (Rs 264 275) What is important to note, however, is that the difference in the prices under the two alternative tax systems is just equal to the sum of the differences in value added and in tax revenues This is, of course, an exact analogue of the difference between the price under VAT and that under FST Clearly, in this model of pure "trade', i e one in which there is no production using produced inputs which are taxed, *there is no cascading even in the case of turnover taxes*

That profits are higher under a multiplicative mark-up system based as they are on tax-inclusive unit values does not imply cascading – exactly as in the comparison between VAT and FST In the case of an additive mark up, since the profits are indentical under VAT and turnover tax the difference in the price to the final consumer arises simply from a difference in the tax revenue realised (Tables 4 and 5) The above result has an interesting corollary

> Given that under identical tax rates the tax revenue is higher under TOT than under VAT, a lower tax rate will be adequate to generate the same revenue as under VAT Consequently for the same tax revenue TOT will also generate lower incentives for tax evasion than in VAT

II
A Production Model

Let us now turn to a consideration of alternative tax systems in a model of production where produced goods subject to taxation are used as inputs in addition to labour

Here we distinguish between two variants of the value added tax In the first variant the tax base is directly the value added at a given stage of production [3] This is called VAT The second variant is the invoice based tax-credit system in which for a given commodity, the tax liability is calculated on the pre-tax sale price at the rate applicable to that commodity and then tax credit or rebate equal to the tax component in the inputs purchased is allowed This is called the rebate-adjusted tax system or RAT for short The VAT and the RAT are contrasted with a non-rebateable excise duty regime, usually described as a cascading tax system or CAT for short

To keep the discussion simple, we consider a two-sector economy with the output of one sector entering as an input in the production of the other Formal algebraic models corresponding to the three tax systems, along with the solution for the prices, are set out in Appendix II Before presenting the results of illustrative simulations for a two-sector production system, two points merit attention

First, given that, under RAT, the tax-credit is admissible at the rate of tax applicable on the commodity used as an input and the tax liability is at the rate applicable to the output, the net tax payable on the input may be negative, zero or positive, depending on whether the tax rate applicable on the input is greater than, equal to or less than the tax rate applicable on the output This has an important implication In a multi-commodity inter-dependent production economy, RAT will be equivalent to a VAT *if and only* if the tax rates applicable on all the commodities are identical

In general with different rates of tax being levied on different commodities under the invoice-based tax credit system recommended by the Chelliah Committee and the more recent NIPFP Report inputs will carry taxes (negative or positive) So that, with non uniform tax rates across sectors, a range of benefits from a switchover to VAT that are premised on the freeing of inputs from tax ation will *not* in fact materialise under RAT

Second in a model of interdependent production multiplicative mark-up may pose problems of economy wide viability arising from the break down of the Hawkins-Simons conditions [4] The system of price formation equations in an input-output system will break down if the (multiplicative) mark-up factor exceeds a critical value To put it differently in a regime of universal multiplicative mark-up, while individual agents may think that they are free to choose the mark-up factor collectively they do not have an unrestricted coice in this matter

In addition to the above, as noted in our analysis of a pure exchange or trade model, under a system of multiplicative mark up the level of profits (and hence value added) is not independent of the tax-inclusive prices underlying the costs As we saw in our comparison of results under FST and VAT, relative to the former profits are higher under VAT than under FST – precisely because a larger tax revenue is being collected under VAT This is characterised, in our judgment wrongly as cascading This feature will also be present in a model of inter-dependent production

In order to avoid possible problems with viability conditions, and to focus attention on the core issue of cascading, we present simulation results only for a model with additive mark-up

For purposes of simulation, we construct a simple two-sector model with Leontief-type fixed production coefficients. By normalisation of units, we treat the direct input-requirement of own output as zero (i e, $a_{ii} = 0$) The two Leontief coefficients a_{12} and a_{21} are taken to be, respectively, 0.10 and 0 15 The labour coefficient, a_{01} and a_{02} are set equal to 3 and 5, respectively. The wage rate, per unit of labour, is assumed to be uniform across sectors and invariant across systems

Two alternative specifications are explored In the first case, the tax rates are kept identical across the two sectors at 10 per cent In terms of the notation used in Appendix II, $t = s = k = 0\ 10$ In an alternative specification, tax rates for the two sectors are different but, for a given sector, same across tax systems More specifically, it is assumed that $t_1 = s_1 = k_1 = 0\ 10$, and, $t_2 = s_2 = k_2 = 0\ 20$ The levels of output in the two sectors is invariant across tax systems and, for concreteness, $x_1 = 200$ and $x_2 = 300$

Tables 6 and 7 present, respectively, the simulation results under a regime of uniform and differentiated tax rates A comparison of the two tables provide confirmation, if at all needed, for the result that the outcomes under VAT and RAT are identical when the tax rates are the same across the two sectors

TABLE 1 PRICE FORMULATION IN A MODEL OF TRADE WITH MULTIPLICATIVE MARK-UP WITH FIRST POINT SALES TAX (FST)

	Producer/Seller A	B	C
1 Cost of inputs/purchase	0	110	165
2 Profits = value added	100	55	82 5
3 Price before tax	100	165	247 5
4 FST	10	nil	nil
5 Selling price	110	165	247 5
6 Total value added	–	–	237 5
7 Total tax revenue	–	–	10 0

Notes FST 10 per cent *ad valorem* tax levied at first point of sale
Mark up Producer A fixed amount
Sellers B and C 50 per cent on purchase price

TABLE 2 PRICE FORMULATION IN A MODEL OF TRADE WITH MULTIPLICATIVE MARK-UP UNDER VAT

	Producer/Seller A	B	C
1 Cost of inputs/ purchases	0	110	170 50
2 Profits = value added	100	55	85 25
3 Price before tax	100	165	255 75
4 VAT	10	5 50	8 525
5 Selling price	110	170 50	264 275
6 Total value added	–	–	240 250
7 Total tax revenue	–	–	24,025

Notes VAT 10 per cent on value added.
Mark-up producer A fixed amount
Sellers B and C. 50 per cent on purchase price

but not so when the sectoral tax rates differ. Also, as expected in a regime of additive mark-ups, the value added remains invariant to the system of taxation.

In assessing the differences in prices across tax systems, note that the unit price of a commodity is equal to the sum of the value added plus the material input costs plus the tax-revenue - all expressed in per unit terms. Consequently, the difference between the unit price of a commodity under two alternative tax systems will also be equal to the algebraic sum of the differences in the three components. In other words, Δ price = Δ value added + Δ material costs = Δ tax revenue.

Now, as we have noted previously, under a regime of additive mark-up the value added per unit of output is the same across tax systems. So that, in this case, the difference in the price of a commodity under two-tax systems is the sum of only two components, namely, the difference in material input costs and that in tax revenue.

Let us compare now the prices (and costs) under CAT and RAT. It is clear that unit prices in both sectors are higher under CAT than under RAT. More significantly, from the perspective of cascading, the difference in prices (for a given sector across tax systems) is not fully accounted for by the difference in tax-revenues realised per unit output. A part of the difference in unit prices is due to the higher material input costs per unit of output under CAT (relative to that under RAT). This is the essence of the phenomenon of cascading.[5]

Having noted the presence of cascading under CAT, it is important to stress that the principal, indeed overwhelming, component of the difference in the price under CAT and that under RAT (or VAT, for that matter) is the higher tax revenue per unit realised under the former tax system.

III
Revenue Neutrality and Relative Prices

Fair comparisons of tax-revenue outcomes under alternative tax systems require that we hold invariant the structure of the economy, the implicit tax base and the level of efficiency in tax administration. In particular, the argument in the Report, that the loss of revenue arising from a switch over to VAT can be made up (or more than made up) by widening the tax base (to cover services) and better enforcement is misleading. Extra revenues through improved efficiency and extension of the tax base to cover services, etc, have to be simply viewed as additional revenues that would be available under all the alternative tax systems.[6]

Equally important in any analysis of alternative tax systems is the question of price outcomes – both absolute and relative. Thus, for example, the impact on the general price level and the rate of inflation arising from a switch over to VAT has been a major concern in many discussions on VAT [Tait 1991]. The issue of relative prices, is, of course, central to any analysis of resource-allocation and efficiency implications of a choice of a tax system.

Taking both considerations into account, the focus of our comparative analysis of alternative tax systems in this section will be on price outcomes with revenue neutrality under a given coverage and efficiency in tax administration.

To examine this issue, we need to consider an economy with a number of sectors (say,n) which are interdependent in production. For simplicity, we may assume a Leontief technology on the same lines as in the preceding section and write out price and revenue equations for a n-sector economy under alternative tax systems, analogus to those worked out for a two-sector economy as given in Appendix II. One would then have to choose a set of tax rates which yield the same revenue under all alternative systems and work out the price implications of tax rates chosen in this way.

Two approaches to revenue neutrality are possible here.

In the first instance, one may ensure that tax revenue is fixed for each sector so that in a n-sector economy there are n constraints and an exact number of choice variables (tax rates) or degrees of freedom. The problem is computationally simple in a linear system. In principle, the procedure would be similar in a non-linear system. However, in this case, a multiplicity of solutions and infeasibility of solutions could arise. To avoid this problem suitable regularity conditions are needed.

Alternatively, we may deal with the problem in a more familiar way but equating total tax revenue for the entire economy which imposes only one constraint and costs only one degree of freedom. The remaining n–1 degrees of freedom can then be used to choose tax rates so as to ensure this the n-1 relative prices have some desirable properties. For example, since VAT is generally viewed as having some desirable characteristics, one may carry out the above exercise taking the price outcomes under VAT as a reference set. Thus, one would first choose a set of tax rates for VAT and work out tax revenues and prices that go with these rates. Then one can choose corresponding tax rates for CAT (or whatever other system may be under consideration), so as to ensure overall revenue neutrality and (n-1) relative prices that would be identical with that under VAT.

A remarkably robust analytical result, corroborated by numerical exercises, turns out to be that sectoral tax rates that ensure revenue neutrality also lead to identical sectoral prices under all tax systems. The result is robust irrespective of whether (a) mark-up is additive or multiplicative; (b) revenue neutrality is sectorwise or in the aggregate with given relative prices; and, (c) some sectors are exempted or not.

In other words,

> So long as a given quantum of tax revenue is collected from each sector price outcomes are invariant to the mode of collection of taxes [Pandit, Sundaram and Mukherji 1993]

This result is indeed important, much more than what may be apparent. For, it knocks out the very basis of the widely held view

TABLE 3: PRICE FORMULATION IN A MODEL OF TRADE WITH MULTIPLICATIVE MARK-UP UNDER A TURNOVER TAX (TOT)

	Producer/Seller A	B	C
1 Cost of inputs/ purchases	0	110	181.50
2 Profits = value added	100	55	90.75
3 Price before tax	100	165	272.25
4 TOT	10	16.50	27.225
5 Selling price	110	181.50	299.475
6 Total value added	–	–	245.750
7 Total tax revenue	–	–	53.725

Notes: TOT: 10 per cent *ad valorem* on the total turnover at each stage.
Mark-up: Fixed amount per unit; producer A: Rs 100; Sellers B and C: Rs 50

TABLE 4: PRICE FORMATION IN A TRADE MODEL WITH ADDITIVE MARK-UP UNDER A VALUE ADDED TAX

	Producer/Seller A	B	C
1 Cost of inputs/purchases	0	110	165
2 Profits = value added	100	50	50
3 Price before tax	100	160	215
4 VAT	10	5	5
5 Selling price	110	165	220
6 Total value added	–	–	200
7 Total tax revenue	–	–	20

Notes. VAT : 10 per cent *ad valorem* on value added
Mark-up fixed amount per unit; producer A: Rs 100; sellers B and C Rs 50.

TABLE 5: PRICE FORMATION IN A TRADE MODEL WITH ADDITIVE MARK-UP UNDER A TURNOVER TAX (TOT)

	Producer/Seller A	B	C
1 Cost of inputs/purchases	0	110	176
2 Profits = value added	100	50	50
3 Price before tax	100	160	226
4 TOT	10	162	2.60
5 Selling price	110	176	248.60
6 Total value added	–	–	200
7 Total tax revenue	–	–	48.60

Notes: TOT: 10 per cent *ad valorem* on the total turnover at each stage.
Mark-up: Fixed amount per unit; producer A: Rs 100; sellers B and C: Rs 50 per unit.

that CAT leads to misallocation of resources. It is true that, with given tax rates, the difference between prices under CAT and those under VAT is not entirely accounted for by the additional tax revenue. But this is immaterial so long as we can choose tax rates under CAT so as to yield any "desirable" set of prices and a pre-specified quantum of revenue.[7]

Zero-rating under RAT, would, however, pose a problem. Notice that, under RAT for a zero-rated sector the revenues will be negative since the positive tax element in the inputs used in its production will need to be rebated. Since the tax rates have to be non-negative, the system of taxes under CAT cannot simulate negative revenues. Lest this is seen as a major problem, it is important to stress that if the standard of reference is the set of price and revenue outcomes under a VAT, zero-rating a sector and excepting that sector have the same effect and the results stated above become relevant. Under RAT, however, exempting a sector and zero-rating that sector are not equivalent. This, of course, raises the question whether the proposals to *exempt* under MODVAT/MANVAT, some items (and small-scale producers) is motivated by considerations of administrative convenience or, of assisting the producers by freeing them from the burden of duty on inputs. If it is the latter, exempting a sector or a class of producers will *not* achieve the stated objective.

For illustrative purposes we carry out a simulation exercise similar to the one discussed in Section II. The difference is on two counts. In the first instance we consider three rather than two sectors to permit the introduction of a zero-rated sector. Secondly, we now solve the system differently. For given VAT tax rates t_1, t_2 and t_3 we determine corresponding CAT tax rates k_1, k_2 and k_3 and RAT tax rates s_1, s_2 and s_3 such that (a) total tax revenues under CAT and RAT are the same as under VAT and, (b) the two relative prices, namely, q_2/q_1 and q_3/q_1 under CAT and, V2/V1 and V3/V1 under RAT are the same as P_2/P_1 and P_3/P_1 under VAT.

For the said exercise we assume the following parameters:

$W=100$; $x' = (9600\ 400\ 3000)$; $\pi = (10\ 8\ 6)$

$$A = \begin{bmatrix} 0 & 0.20 & 0.12 \\ 0.15 & 0 & 0.14 \\ 0.07 & 0.10 & 0 \end{bmatrix} \quad a_0 = (0.15\ 0.10\ 0.08)$$

In Table 8 we report the results of the simulation exercise regarding tax rates, sectoral revenues and prices when the CAT tax rates k_1, k_2 and k_3 and the RAT tax rates s_1, s_2 and s_3 are left free to adjust to ensure that total revenue is the same as under VAT.

A few features of these results need to be highlighted.

First, as is to be expected, tax rates are the lowest under CAT and second lowest under RAT. This, by itself, is not important except to the extent that higher tax rates may induce greater tendency for tax evasion. Second, even though we require only total tax revenue to be maintained at the VAT level it is indeed the case that the revenues are maintained as the VAT level for each sector individually. Third, the prices under the three systems are identical.

Now we repeat the foregoing exercise setting the tax rates in sector 3 to be equal to zero under all systems. With this constraint, added to the condition of total revenue neutrality, in this three-sector model we have only one degree of freedom left. This can be used to fix only one relative price equal to that under VAT. In this exercise we thus set q_2/q_1 and V_2/V_1 to be equal to P_2/P_1. The results are given in Table 9.

Four points are noteworthy. First, all sectoral prices and revenues under CAT and VAT are identical. Second sector 3 being zero rated, under RAT producers in this sector have to be subsidised to the tune of taxes they have paid on their purchases. This subsidy has to be borne by producers in the other two sectors as indicated by higher tax rates. Second, prices for sectors 1 and 2 under RAT are higher than under VAT or CAT while that for sector 3, is lower under RAT than under the other two systems. Clearly, this is because of the subsidy. Third, under RAT, only one of the two relative prices is equalised to that under VAT.

Finally, we turn to a set of exercises in the NIPFP Report seeking to demonstrate how the revenues from central excise at the level of 1991-92 actuals can be realised even while extending the MODVAT to cover, among other items, petroleum products and capital goods. We refer here to Tables A.1.1 through A.1.5 (pages 112 through 115) of the Report.

Two of the three major proposals contained in the NIPFP exercise relate to withdrawal of exemptions and the imposition of a tax on services. Together, these two proposals are expected to generate Rs 3,800 crore at 1991-92 levels of activity. These two proposals are not intrinsically tied to a switchover to VAT, or, in this case, an extension of MODVAT to petroleum products and capital goods. And, as such, the revenues generated by these two proposals would be available even in a

TABLE 6: COSTS, PRICES AND REVENUES IN A PRODUCTION MODEL WITH ADDITIVE MARK-UP: UNIFORM TAX RATES

	Tax Systems		
	VAT/RAT	CAT	CAT-VAT
	Sector 1		
1 Value added	310.00	310	0.00
2 Material input cost	91.46	92.27	0.81
3 Tax revenue	31.00	40.23	9.23
		(91.23)	
4 Unit prices	432 46	442.50	10.04
	Sector 2		
5 Value added	515.00	515.00	0.00
6 Material input cost	43.25	44.25	1.00
7 Tax revenue	51.50	55.93	4.43
		(81.58)	
8 Unit prices	609 75	615.18	5.43

Notes: 1 Uniform tax rates across sectors and tax systems: 10 per cent *ad valorem*.
2 Value added, Material input costs and tax revenues in each sector are normalised on a per unit basis.
3 Figures within brackets indicate the percentage share of the difference in the two revenues in the total difference in unit prices

TABLE 7: COSTS, PRICES AND REVENUES IN A PRODUCTION MODEL WITH ADDITIVE MARK-UP DIFFERENTIAL TAX RATES

	VAT	RAT	CAT	CAT-VAT
		Sector 1		
1 Value added	310.00	310.00	310.00	0.00
2 Material input cost	99.30	99.78	100.84	1.06
3 Tax revenue	31.00	22.68	41.08	18.40
			(94.55)	
4 Price	440.30	432.46	451.92	19.46
		Sector 2		
5 Value added	515 00	515.00	515.00	0.00
6 Material input cost	44.03	43.25	45.19	1.94
7 Tax revenue	103.00	106.93	112.04	5.11
8 Price	662.03	665.18	672.23	7.05

Notes: 1 Tax rates uniform across systems but different across sectors: t1=s1=k1=0.10; and, t2 = s2 = k2 = .20
2 Value added, material input costs and tax revenues in each sector are normalised on a per unit basis.
3 Figures in brackets indicate the percentage share of the difference in tax revenues in the total difference in the unit prices.

situation where such a switchover/extension does not take place.

The third proposal is the introduction of a special non-rebateable, non-shareable excise on nine major items, including, petroleum products, motor vehicles, rubber products, cement and plastics. This proposal to levy a non-rebateable and non-shareable (with the states) special excise is projected to yield Rs 3,524 crore at 1991-92 levels of activity. Two comments would appear to be in order.

First, the motivation. A principal motivation for this exercise in the NIPFP Report is rate rationalisation. As things stood in 1991-92, the average rate of duty in many cases exceeded 20 per cent *ad valorem*. In some cases they were as high as 40 per cent and, in one case it was 75 per cent. Even in respect of a range of petroleum products, though levied as a specific duty, the equivalent *ad valorem* rates were as high as 18 per cent for kerosene for domestic use and a little over 20 per cent in the case of motor spirits. These high rates represent an open invitation to evasion. As a part of the recommended rate rationalisation, these rates were to be reduced to 5 per cent *ad valorem* for petroleum products and to be kept within the 10 to 20 per cent range for all other commodities.

Secondly, and more importantly, the imposition of this special excise on top of the existing MODVAT set of taxes will make for a mixture of a RAT and a CAT. In the case of petroleum products, an existing CAT-type tax is being replaced by a small rebateable VAT and a large non-rebateable CAT. In the case of other products a larger RAT is being sought to be replaced by a combination of a RAT and a CAT. Such a mongrel tax system promises to be an administrative nightmare besides generating price outcomes whose relationship to the desired VAT-based prices are far from clear.

IV
Conclusion

In bringing together the results and drawing out some implications for tax reform it is necessary to reiterate that the principal focus of this paper has been on a reappraisal of key issues bearing on the choice of the tax system. This has meant that a range of issues relating to the implementation of VAT or its variants in a federal context have not been examined here. Apart from the availability of other reviews of these questions including, in particular, the NIPFP Report and an earlier study by Burgess, Howes and Stern (1993), this omission stems from our view that at least some of the key issues such as greater harmonisation of tax rates and the need to avoid unnecessary tax-competition across states need to be addressed independently of a switchover to a VAT or its variants.

Let us turn now to our principal findings and their implications for tax reform.

A key result from our analysis of cascading in a pure 'exchange' or trade model is that the two principal domestic trade taxes, namely, the first point sales tax (FST) and the turnover tax (TOT) do not cascade. Thus, as long as the inputs entering the production process are not taxed, or, on a more practical plane, lightly taxed, the choice between FST and VAT will turn on the relative ease of collection of FST to be weighed against the possibly greater incentives to evasion arising from the need to impose a higher rate of FST to collect the VAT revenue. On a parallel consideration, however, given at least comparable ease of administering a TOT and a VAT, the lower rate of TOT required to generate a given revenue under VAT implies that the evasion-incentive factor would favour TOT over VAT. Clearly, therefore, while a number of considerations may yet offer grounds for reforming domestic trade takes, cascading, properly understood, is not one of those considerations.

What about production taxes?

A key argument widely advanced in favour of a switchover to VAT is the need to free inputs from taxation so that input choices are made efficiently without being distorted by input-taxation. Our analysis with a model of interdependent production yields the result that, under an invoice-based VAT (or RAT as we have labelled it) with non-uniform tax rates across sectors, inputs are, in general, not free from taxes (positive or negative).

A particular case of non-uniform rates deserves a special consideration. This is the case of zero-rated sectors. In contrast to both CAT and an accounts-based VAT, zero-rating a sector under RAT does not imply that the net revenue from that sector is zero. In fact, with the rebating of taxes on inputs, the revenue from a zero-rated sector under RAT will be negative. This has two implications. First, the producers in the zero-rated sector will have to collect the rebate from the government. (Strictly, this situation will arise in all cases where the tax liability is less than the tax credit available on inputs). And, as anyone who has had to deal with government bureaucracy would readily testify, the costs of collecting the tax rebate are strictly positive (see Mukherji, Pandit and Sundaram 1993].

From the perspective of resource-use-efficiency, zero-rating under RAT has another disadvantage. Given that under a proper VAT – which has the advantage of freeing inputs from taxes – the tax rates can at best be zero (yielding zero revenues), the relative prices involving the zero-rated sector under RAT cannot be rendered equal to that emerging under a proper VAT.

Seen from the above perspective, CAT scores over RAT or the invoice-based version of value-added tax recommended by the Chelliah Committee (1992) and the more recent NIPFP Report. As has been illustrated in Tables 8 and 9 (and this can be rigorously proved for a general n-sector economy with additive or multiplicative mark-up), the tax rates under the so-called cascading type taxes, can be so structured as to exactly replicate the VAT prices (or any other set of "desirable" prices). Importantly, this structure of CAT-tax rates will not only replicate VAT prices but will also ensure overall (or sector-by-sector) revenue neutrality. In fact, the tax-revenues generated under VAT can be replicated by CAT with lower *ad valorem* rates than under VAT, thus providing lower incentives for tax evasion. Curiously, the very phenomenon of cascading can be, as it were, turned on its head and used to operate with lower tax rates.

This brings us to our last point. In the NIPFP Report, in an attempt to preserve revenue neutrality and yet work with VAT (or rather RAT) tax rates in the 10-20 per cent range, we have what can only be characterised as a bizarre solution: the recommendation to impose an additional non-rebateable (and non-shareable) special excise on top of a VAT. Whatever be the shape of a desirable tax regime, it cannot be this mongrel system.

TABLE 8: SIMULATION RESULTS WHEN ALL TAX RATES UNDER CAT AND RAT ADJUST

	Tax Rates			Tax Revenues	Prices
	VAT	RAT	CAT	VAT/CAT/RAT	VAT/CAT/RAT
Sector 1	0.10	0.0942	0.0812	1500	33.29
Sector 2	0.05	0.0626	0.0334	360	27.86
Sector 3	0.08	0.0794	0.0512	336	23.02

TABLE 9 : SIMULATION RESULTS WITH ONE ZERO RATED SECTOR

						Prices		Prices Relative to Sector 1	
	VAT	RAT	CAT	VAT/CAT	RAT	VAT/CAT	RAT	VAT/CAT	RAT
Sector 1	0.10	0.107	0.087	1500	1658	31.3	31.6	1	1
Sector 2	0.15	0.142	0.116	1200	1304	28.9	29.1	0.923	0.922
Sector 3	0.00	0.000	0.000	0	-262	21.8	21.0	0.70	0.66

Appendix I

TABLE A1: CASCADING IN A TRADE MODEL WITH MULTIPLICATIVE MARK-UP AND UNIFORM TAX RATE.

	Dealer			Total
	A	B	C	
Costs of inputs/purchases	0	110	181.5	
Price before tax	100	165	272.5	
Tax	10	16.5	27.2	53 7
Sales price with tax	110	181.5	299.5	
Value added	100	50	75	225

Notes: This table appears as Table 2 2 of the NIPFP report and is reproduced here for ready reference.

1 Difference between final selling price and cost = 299.5 – 225 = 74.5
2 Tax on value added only = 10 per cent on 225.
3 Cascading due to tax on inputs = 53.7 – 22 5 = 31.2
4 Additional cascading by price mark-up on tax = 74.5 – 53 7 = 20.8

Appendix II

The objective of this appendix is to highlight in algebraic terms price formation and tax revenue relations under three tax systems, namely, value added taxation (VAT), rebate adjusted taxation (RAT) and cascading type taxation (CAT). We shall also set out these relations under additive and multiplicative mark-up regimes. In all cases taxation is at *ad volarem* rates. For simplicity we shall consider only a two sector economy and without loss of generality set $a_{ii} = 0$.

We take up the additive mark-up first as follows – Under VAT we have prices given by:

$$\begin{aligned} p_1 &= a_{21}p_2 + (1 + t_1)(wa_{01} + \pi_1) \\ p_2 &= a_{12}p_1 + (1 + t_2)(wa_{02} + \pi_2) \end{aligned} \quad (1)$$

which implies

$$\begin{aligned} p_1 &= [(1 + t_1)(wa_{01} + \pi_1) \\ &\quad + a_{21}(1 + t_2)(wa_{02} + \pi_2)]/\Delta \\ p_2 &= [(1 + t_2)(wa_{02} + \pi_2) \\ &\quad + a_{12}(1 + t_1)(wa_{01} + \pi_1)]/\Delta \end{aligned} \quad (2)$$

where $\Delta = 1 - a_{12}a_{21}$

$$\begin{aligned} VR1 &= t_1(wa_{01} + \pi_1)x_1 \\ VR2 &= t_2(wa_{02} + \pi_2)x_2 \end{aligned} \quad (3)$$

It is clear that each sectoral price level depends not only on the tax rate applicable to that sector but also on the tax rate applied to the other sector. Also, the relative price p_1/p_2 is not free from the tax rates unless the two sectoral tax rates are identical.

Under the same additive mark-up set-up let us consider the rebate adjusted tax (RAT) system. In this case, the prices V_1 and V_2 and revenues are given as follows.

$$\begin{aligned} v_1 &= (1 + s_1)[wa_{01} + \pi_1 + a_{21}v_2 \\ &\quad - s_2a_{21}v_2/(1 + s_2)] \\ v_2 &= (1 + s_2)[wa_{02} + \pi_2 + a_{12}v_1 \\ &\quad - s_1a_{12}v_1/(1 + s_1)] \end{aligned} \quad (4)$$

which simplifies to

$$v_1 = (1 + s_1)(wa_{01} + \pi_1 + \frac{a_{21}v_2}{1 + s_2})$$

$$v_2 = (1 + s_2)(wa_{01} + \pi_2 + \frac{a_{12}v_1}{1 + s_1}) \quad (4')$$

This gives

$$\begin{aligned} v_1 &= (1 + s_1)[(wa_{01} + \pi_1) + a_{21}(wa_{02} + \pi_2)]\Delta \\ v_2 &= (1 + s_2)[(wa_{02} + \pi_2) + a_{12}(wa_{01} + \pi_1)]\Delta \end{aligned} \quad (5)$$

$$\Delta = 1 - a_{12}a_{21}$$

Also,

$$RR1 = [s_1(wa_{01} + \pi_1) + \frac{(s_1 - s_2)}{1 + s_2}a_{21}v_2]x_1$$

$$RR2 = [s_2(wa_{02} + \pi_2) + \frac{(s_2 - s_1)}{1 + s_1}a_{12}v_1]x_2 \quad (6)$$

Two points of considerable significance need to be underlined here. First, each sectoral price level is determined only by the tax rate applicable to that sector and independent of the tax rate applicable to the other sector. Second, price and revenue outcomes of VAT and RAT are identical only when, $t_i = s_i$ and is the same across sectors, i e, $t_1 = t_2 = s_1 = s_2 = t$. Even more significantly, the relative prices p_1/p_2 or V_1/V_2 are independent of the tax rates only if these (tax rates) are identical across sectors.

Similarly, for CAT, under an additive mark-up scheme, we have the following equations defining price formation.

$$\begin{aligned} q_1 &= (1 + k_1)(wa_{01} + \pi_1 + a_{21}q_2) \\ q_2 &= (1 + k_2)(wa_{02} + \pi_2 + a_{12}q_1) \end{aligned} \quad (7)$$

which gives us solutions for q_1 and q_2 as

$$\begin{aligned} q_1 &= (1 + k_1)(wa_{01} + \pi_1 + a_{21}(1 + k_2) \\ &\quad (wa_{02} + \pi_2)]/\Delta^* \\ q_2 &= (1 + k_2)(wa_{02} + \pi_2 + a_{12}(1 + k_1) \\ &\quad (wa_{01} + \pi_1)]/\Delta^* \end{aligned} \quad (8)$$

with $\Delta^* = 1 - a_{12}a_{21}(1 + k_1)(1 + k_2)$
and revenues are:

$$\begin{aligned} CR1 &= k_1q_1x_1/(1 + k_1) \\ CR2 &= k_2q_2x_2/(1 + k_2) \\ CR1 &= k_1x_1[(wa_{01} + \pi_1) + a_{21}(1 + k_2) \\ &\quad (wa_{02} + \pi_2)]/\Delta^* \\ CR2 &= k_2x_2[(wa_{02} + \pi_2) + a_{12}(1 + k_1) \\ &\quad (wa_{01} + \pi_1)]/\Delta^* \end{aligned} \quad (9)$$

Let us now consider the multiplicative mark-up regime. Under VAT prices are given by:

$$\begin{aligned} p_1 &= a_{21}p_2 + (1 + t_1)[(1 + \theta_1)wa_{01} + \theta_1a_{21}p_2] \\ p_2 &= a_{12}p_1 + (1 + t_2)[(1 + \theta_2)wa_{02} + \theta_2a_{12}p_1] \end{aligned} \quad (10)$$

Tax revenues would be given

$$\begin{aligned} VR1 &= t_1[(1 + \theta_1)wa_{01} + \theta_1a_{21}p_2]x_1 \\ VR2 &= t_2[(1 + \theta_2)wa_{02} + \theta_2a_{12}p_1]x_2 \end{aligned} \quad (11)$$

Under RAT the corresponding relationships are:

$$\begin{aligned} v_1 &= (1 + s_1)(1 + \theta_1)(wa_{01} + a_{21}v_2) \\ &\quad - s_2a_{21}v_2/(1 + s_2) \\ v_2 &= (1 + s_2)(1 + \theta_2)(wa_{02} + a_{12}v_1) \\ &\quad - s_1a_{12}v_1/(1 + s_1) \end{aligned} \quad (12)$$

whereas tax revenues are given by

$$\begin{aligned} RR1 &= x_1[s_1(1 + \theta_1)(wa_{01} + a_{21}v_2) \\ &\quad - s_2a_{21}v_2/(1 + s_2)] \\ RR2 &= x_2[s_2(1 + \theta_2)(wa_{02} + a_{12}v_1) \\ &\quad - s_1a_{12}v_1/(1 + s_1)] \end{aligned} \quad (13)$$

Similarly, for CAT we have prices given by

$$\begin{aligned} q_1 &= (1 + k_1)(1 + \theta_1)(wa_{01} + a_{21}q_2) \\ q_2 &= (1 + k_2)(1 + \theta_2)(wa_{02} + a_{12}q_1) \end{aligned} \quad (14)$$

and revenues by:

$$\begin{aligned} CR1 &= x_1k_1(1 + \theta_1)(wa_{01} + a_{21}q_2) \\ CR2 &= x_2k_2(1 + \theta_2)(wa_{02} + a_{12}q_1) \end{aligned} \quad (15)$$

Notation

p_i, q_i, v_i	Prices for the ith sector under VAT, CAT and RAT, respectively
t_i, k_i, s_i	Tax rates (*ad valorem*) for the ith sector under VAT, CAT and RAT, respectively
VR_i, CR_i, RR_i	Tax revenues for the ith sector under VAT, CAT and RAT, respectively
x_i	Physical output level of the ith sector
a_{ij}'s	Fixed intermediate input coefficients
a_{oi}	Fixed labour input coefficients
w	Wage rate
θ_i	Multiplicative mark-up rate
π_i	Additive mark-up margin

Notes

1 Incidentally, there would appear to be an error in the computation of value added in respect of sellers B and C as given in Table 2.2 of the Report. Since, except in the first stage where profits (or value added) is a fixed amount, profits/value added is a 50 per cent multiplicative mark-up on the purchase price, the value added should be Rs 55 and Rs 90.75 instead of Rs 50 and Rs 75 respectively for B and C.

2 Lest too much is read into this distinction between additive and multiplicative mark-up, it is worth noting that, even in the so-called multiplicative mark-up case, the profits (value added) for the owner of the natural spring is indeed a *fixed amount* per unit. This is so for the simple reason that, under the assumption of zero inputs (and, no labour cost), a multiplicative mark-up on a base of zero will yield zero profits! See also the discussion in the text on the issue.

3 An important question here is the treatment of interest payments. Analytically, a satisfactory treatment would involve the introduction of an explicit financial services sector with the interest payments from the rest of the system flowing into that sector as receipts. These receipts, in turn, will be divided into wages and profits in the financial services sector. In this perspective, in the production sectors, only wages and profits constitute the value added. This is the approach we follow.

4 As is well known, the Hawkins-Simons conditions formalise the requirement, in essence, that after allowing for both direct and indirect requirements, it takes less than 1 unit of a commodity for producing a unit of that commodity.

5 It is easily seen that, if inputs are to be purchased at the beginning of the production period, the higher unit prices of material inputs will translate into higher requirements for working capital and therefore higher interest costs under CAT (relative to either VAT or RAT).

6 This will be the case unless, for example, a higher degree of tax compliance is demonstrably linked to a particular tax system.

Schedule 17—Notes on Accounts

1 **Principal Accounting Policies**

1.1 General

The financial statements have been prepared on the historical cost basis

1.2 Foreign Currency Translation

I Assets and liabilities in foreign currencies are translated on the Balance Sheet date at the rates notified by Foreign Exchange Dealers' Association of India (FEDAI) The resulting profit or loss on revaluation is included in the Profit and Loss Account

II. Income and Expenditure items are accounted for at the exchange rates ruling on the date of the transaction

III Contingent liabilities on account of outstanding forward exchange contracts have been disclosed at the contractual rates

1.3 Investments

In accordance with the Accounting Standards for Investments laid down by the Reserve Bank of India investment portfolio is classified into "Permanent" and "Current" categories

Permanent investments are stated at cost adjusted for premium or discount (if material) amortised over the period of investment

1.4. Advances

Provisions for bad and doubtful advances are made to the satisfaction of the Auditors on the basis of norms laid down by the Reserve Bank of India for identification of and provisioning for non-performing assets (No such provisions were required as at 31st March, 1995).

STATE BANK OF MAURITIUS LTD.

BOMBAY BRANCH

15 Fixed Assets

I Fixed assets are stated at historical cost less accumulated depreciation

II Depreciation is provided for on fixed assets as under at the stated rates which are equal to/higher than those prescribed under Schedule XIV to the Companies Act, 1956

Type of Assets	Rates	Method
Office Premises	2%	SLM
General Plant and equipments (including A C Plant)	10%	SLM
EDP equipments, Computers	20%	SLM
Furniture & Fixtures	10%	SLM
Motor Car	25 89%	WDV

16 Revenue Recognition

Interest on advances Income from investments and Commission and brokerage are accounted on accrual basis

2 This being first year of operations previous year s figures cannot be given

Report of the Auditors

We have audited the attached Balance Sheet of the Bombay Branch of State Bank of Mauritius Ltd , as at 31st March 1995 signed by us under reference to this report and the relative Profit and Loss Account of Bombay Branch of the Bank for the period ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with provisions of sub-sections (1), (2) and (5) of section 211 and sub section (5) of section 227 of the Companies Act, 1956 the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956 The Accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949

We report that subject to and read with the foregoing remarks

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory,

b) The transactions of the Branch which have come to our notice, have been in our opinion, within the powers of the Bombay Branch of the Bank,

c) In our opinion, proper books of account as required by law, have been kept by the Branch so far as it appears from our examination of those books,

d) The Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account as adjusted, for entries passed subsequently, as of 31st March 1995,

e) In our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the State of Affairs of the Bombay Branch of the Bank as at 31st March, 1995 and Profit and Loss Account gives a true and fair view of the Loss of the Bombay Branch for the period ended on that date

Under Globalisation

Will Nation State Hold?

Rajni Kothari

There seems to be a convergence of the views of some intellectuals on the crisis of governability and the concerns of foreign investors and international institutions regarding demands from the labouring classes. There is also growing agreement on the need to reduce the role of the state and hand things over to the market. The widespread feeling that the nation state is in trouble and will not survive the growing pressures from within and without needs to be examined.

OVER the last two decades and more, with the growing democratisation of diverse societies and the quickening pace of the rise of mass consciousness, the ruling circles round the world (both domestic and international) seem to display two divergent responses. On the one hand they think they have won the battle against communism and left wing radicalism, hence the 'end of history thesis'. On the other hand, they seem to be deeply concerned at the challenge being thrown up by the masses – the so far ostracised depressed and backward' social classes that were somehow held at bay through a combination of small crumbs and an elitist theory of democracy – and by plural societies experiencing an upsurge of consciousness all round of diverse minorities and women. They are increasingly concerned with the whole issue of governance and governability, and with that of the maintenance of public order and security of the state and transnational capital in the face of rising expectations and demands from the grass roots.

In the mid-1970s a set of leading American, European and Japanese intellectuals published a document which was presented as a report to the Trilateral Commission in which a case was made out for the need to restrain political participation in liberal democracies of the west and Japan in the face of a changed domestic and international environment. It was called 'The Crisis of Democracy. Report on the Governability of Democracies to the Trilateral Commission' (The authors were Michael J Crozier (French), Samuel P Huntington (American) and Joji Watanuki (Japanese).) The same concern is reflected among academics and others in the developing countries in recent years – perhaps more in these countries than in the west. A leading Indian political scientist settled abroad, Atul Kohli, published a book in 1990 which has been generally well received, called *Democracy and Discontent: India's Growing Crisis of Governability* (Cambridge University Press, New York). At home leading journalists and intellectuals have expressed a similar concern: how will the Indian state survive if it is to concede to all kinds of demands coming from such a wide variety of groups and regions?

Such a concern has been even more on the increase since the charter of demands set forth in the report of the Mandal Commission was endorsed by the National Front government and has since been by and large accepted by all political parties. There is, in consequence growing evidence of a rise in mass consciousness among the hitherto marginalised sections of society who have also begun to assert themselves in elections, legislative bodies and the forums of political parties. It is a concern that is being voiced in a variety of elite circles and is also reflected in the mass media, especially the press (national regional and local). The horrid violence and highly excited reaction (including self immolation) witnessed on university campuses after the acceptance by the National Front government of the recommendations of the Mandal Commission in 1990 – and generally of the whole conception of reservations for deprived and hitherto excluded strata – were only part of this phenomenon. The fact that there was at least indirect support given to this by eminent professors and leading writers, journalists and party politicians in the mainstream press was another. the divisions that this has spurred in parties like the Janata Dal and sections of both the left parties and the Congress in recent months is yet another.

Paradoxically more or less the same people who are concerned about the growing vulnerability of the state to such pressures from the grass roots seem to be quite at home with the policies of liberalisation and globalisation which too are leading to a growing erosion of the authority and power of the Indian state. For them, pressures and demands from within emanating from one's own people, are more dangerous than the pressures and demands coming from foreign corporations, institutions like the World Bank and the IMF, the emerging global trade and patents organisations following the latest round of GATT agreements and, subtly but no less clearly, various trade and other regimes in the US and western Europe who are commandeering the global economic and technological future. There is evidence of growing marginalisation of the state in the face of a variety of globalising intrusions.

In fact a growing disempowerment of the state and of the national elite both in its power to enforce national priorities and its power over subordinates whether this be the bureaucracy which is found to increasingly receive signals from external agencies or the state governments many of whom are vying with each other to get direct access to foreign corporations. All this is quite apart from the fact that the very countries from where these corporations are coming also happen to be involved (more than before the end of the cold war') in arms manufacture and arms sales, to which countries like India are made hostage both due to perceived threats from abroad and with a view to deal with social unrest and pressures from the lower classes the minorities the revolting regions and nationalities.

By now it seems clear that the concerns of some intellectuals and journalists (and politicians) with respect to growing democratic pressures and demands such as better wages and employment opportunities from the labouring and other classes and the concerns of foreign investors with respect to the same issues seem to be converging. They are also converging on the need to reduce the role of the state in the affairs of the country and hand over things to market mechanisms and to increase integration into the 'world market'. There has been a growing body of opinion in the country that thinks of liberalisation and globalisation as providing answers to not only the economic malaise that they perceive but also the political process that is demanding from the state responses and concessions to the newly aspiring and increasingly mobile and assertive social classes. They would seem to want a system of governance which would gain strength from external interventions. This is precisely what the proposed 'new world order' is supposed to be about, with its emphasis on a single unified and managed

world ensuring international security and peace' and the settlement of whatever disputes and conflicts that arise both between nations and between classes, with the help of the new custodians of human interest that have emerged on the world scene since the end of the cold war'

In reality of course the disempowerment of the state and its growing marginalisation in the agendas of nations have also been taking place as a result of both the discontent and the alienation of the masses of people who had for long relied on the state for their own empowerment These people have of late been, of the view that the state is no longer available to them for this and that they will need to devise their own strategies and institutions increasingly relying on civil society and their own community resources to deal with the problems they face today and will be facing in the years to come In their minds too then, the state is getting marginalised although, unlike with the middle class elite this is not their preference they would still like to struggle along right against structures of oppression and exploitation within civil society and to that end, as they are able to gain in these struggles try to transform the state as well Realistically the poor cannot afford to give up on the state as an institution or on the democratic political process including traditional avenues like elections and parties

It seems to me that the feeling that the nation state is in trouble and that it will not survive the growing pressures from within and without may not stand really close scrutiny At most one can say that the state is in crisis as it faces a world that is undergoing transformation which is subjecting it to diverse pressures including pressures for reducing its traditional role in human affairs The crisis is likely to deepen as it faces an increasingly restive population which is not any longer accepting the authority of the state just for the asking which is beginning to make demands that go beyond the conventional expression of varied interests and is in fact asking for a major recasting of priorities and structures including as some of them would put it system transformation

In what follows I shall in the light of the above summation deal with different facets of the crisis of the state as I see it unfolding the dilemmas that it poses for different sets of actors, and the likely possibilities that lie in store as we move further into the 1990s and beyond

Historical Overview

From the beginning (starting before we became independent) the thinking in India has been in terms of conceiving the state as a nation state On the one hand this involved the task of building a single, new identity called the nation encompassing several identities and affiliations The relationship of the new nation to pre existing identities was in part to be one of transcendence, though it was far more to be one of encompassing them and in some ways even 'representing' them all in a composite manner On the other hand this very conception of encompassing diverse identities – social and regional linguistic and cultural meant giving a key role to the state through which the composite nation was to be created In effect it was statehood that gave to the new entity at once an encompassing representative and transcendent quality International thinking and general theoretical predispositions too were in favour of the centrality of the role of state in post colonial societies it once a symbol of authority and an instrument of social change The basic ideology was integrationist though it also carried within it notions of social change and transformation It almost reminds one of the Hegelian idea of the state although the authoritarian overtones of such an integrationist ideology came much later as did the assertion of various pluralities which together produced a crisis of representativeness of the state in countries like India

For a long time the nation-building exercise was conceived to be one that simultaneously led to greater unity of the nation and greater involvement and participation for the citizen in the institutions of the state Hence the conception of an open society and the belief that democratic participation was the best way of achieving national integration The elite undertook to promote democracy through the very composition and institutional structures of the state the parliament and state legislatures cabinet government at different levels which were to promote consensus through representing diverse regions and interests, and administrative structure that were to be accountable, a federal continuum through which such governments and administrations were to operate and a judicial system that was to ensure that all these institutions operated responsibly and according to the 'rule of law' There was also a unique party system which saw to it that the relationship between the government and the social structure was a continuous one both vertically and laterally, and was mediated by a number of intermediate institutions and elites It was through the party system that the colonial 'steel frame' was conditioned by political processes and actors

The elite itself chose to relate to diverse interests in society as well as to its traditional voluntaristic infrastructure, thereby narrowing the distance between government and the people (no doubt the more organised and 'vested' among them) and reducing the mutual alienation that was inherent in the imported Westminster model Inherent in such a conception were two seemingly opposite ideas but which were meant to serve a common purpose namely, the building of a democratic nation state The first of these was to make the new state encompass diverse interests and identities, the second was to assign primacy to the state in the whole process of nation-building Inherent in the first is a decentralised conception of sharing power and carrying diverse entities in a common enterprise The second, on the other hand, left to itself could produce a centralised model of governance But the two together were meant to produce a workable balance between a strong and coherent centre and a series of vibrant sub-centres representing the large variety of structures and spaces through which a composite nation state was to take effect The nationalist ideology that had accompanied such a conception was both integrative and open to diverse interests and groupings, including dissenting ones

This model of a nation state is today in disarray On the one hand the state is ceasing to be the central mechanism of the nation, while on the other hand the 'nation' that had come into being has entered a process of acute fragmentation multiple polarisations and likely disintegration Both the retreat of the state and the erosion of the nation are going hand in hand, one being hijacked by the global 'order' and 'market' and the other facing serious challenges from within, from the large number of peripheries as well as sideways from different regions and nationalities With this the project of nation-building and, as part thereof, the central role of the state in social change is likely to suffer a setback As this happens the autonomy of civil society too will decline and with it may also go down the modern search for a democratic order The homogenising thrust that is inherent in the processes of globalisation – the market being only one of them, the globally inspired mass media spreading standardised sets of images and messages *vis-a vis* consumer preference being another – will only reinforce disintegrative tendencies that are already at work, quite the opposite of the 'macro' integrative design of the proponents of a new world order

Alongside such globalisation there has emerged what may in theory appear to be its anti-thesis, the rise of regional chauvinism and ultra-nationalism based on religious fundamentalism, which too, like

globalisation, seeks to suppress various pluralities though more along a religious direction than an economic or technological one. It will also pitch nation states against one another and internally provoke a series of sub-nationalisms representing various suppressed or latent nationalities and ethnicities.

It appears now that the early modernisers who thought of creating a modern nation state in India (as in many other countries in the third world) had an inadequate understanding of the contradictions that were inherent in such an enterprise particularly given the fact that the 'nation' was sought to be built on a social terrain that was full of not just multiple diversities but also of gross disparities which far from being reduced by the new structure of a 'state', were likely to be accentuated. As the country moves towards the 21st century, it is going to face this shift from integrative to disintegrative tendencies more sharply than was the case during a large part of the 20th century.

Growing Erosion and Retreat

We can now examine the diverse types of erosion that the nation state in India finds itself facing today.

First, there has been under way for quite some time now an erosion of the legitimacy of the state in the eyes of the people of India both in respect of its standing in the eyes of those who for long depended on it for their well-being and in respect of its credibility in the eyes of others (the middle class professionals and the media in particular). Second, there has taken place, over the years, a gradual erosion of authority, *vis-a vis* the aura and arve ('majesty'[8]) with which the state was looked up to both by the citizens at large and, in respect of the authority of the centre, by intermediate and local units and institutions the states, district and lower level bodies, community organisations, voluntary structures and other institutions of civil society. The mounting challenges to central authority by a whole array of regional movements of both autonomy and separatism have rendered the state an arena of growing conflicts and violence. Third, there has taken place an erosion of the whole conception of a distinctive and overriding role of the Indian state both *vis-a-vis* other loci of power within the country (industry, labour, religion, caste, linguistic and ethnic identities) and *vis-a-vis* external interests (dominant centres of geopolitical and strategic power, international financial institutions, transnational structures of capital and commerce), which has led to a declining emphasis on things like autonomy and self-reliance and a declining interest in international support for the same, from G-77 to the social and economic institutional structures within the UN system such as UNCTAD, ILO, UNICEF and UNRISD – their place being taken by the World Bank, the IMF and now the World Trade Organisation (WTO).

Beyond this statement on the multiple erosions facing the Indian state are several other observations. The state in India, instead of occupying centre stage in the social and economic arenas, is seen to be in retreat. This is obvious in the economic sphere from which it has been retreating over more than two decades now and of course most dramatically since 1991-92. But it is also true in the social sphere in matters such as providing opportunities to the minorities, the backward classes, tribal communities and women and children, encouraging people's initiatives and indigenous thinking in key areas such as education, environment, health and housing, and generally implementing the laws of the land for the betterment of the poorer and oppressed sections of society. It is by now abundantly clear that it is only by enhancing the capabilities of the people in terms of their levels of education, health and a non-hazardous environment and sanitation that they feel and actually become empowered to carve out an economic future for themselves. Poverty, the destitution cannot be removed for large sections of society through bureaucratic planning; they can only be removed by the poor themselves. For this to happen they have to become empowered in these social spheres. But it is precisely on these that the state is found to be retreating.

Of course, as far as the people are concerned, far from allowing the state to retreat from its social obligations, they are in fact subjecting it to increasing challenges from both ethnic and regional movements and class and caste arenas in the struggles for their democratic rights. But this is happening at a time when those in charge of the state have been, almost by design, losing their grip and lowering their thresholds of interest and concern for large parts of the social and regional terrain. Together, the two tendencies (one seeking restructuring of the state and the other its withdrawal from constitutionally assigned roles)[9] are leading to a situation in which there is a growing sense of disintegration of the polity.

Integration into 'World Order'

Pari passu with this retreat of the state domestically has been its decline as a political entity internationally. Here one finds that far from continuing to assert its identity and independence *vis-a-vis* dominant centres of power in co-operation with other countries of the south, the Indian state is being prepared by its bureaucratic, industrial and technocratic elite to become integrated into a 'world order' that is being designed in western think tanks such as the Rand Corporation and the three Bretton Woods institutions. Though it has so far been presented in terms of integration into the world market, still assuming that economic integration need not lead to political dependence or social and cultural absorption – an assumption that seems to me to be at once naive and deceptive – the general consequence of such integration is a clear loss of autonomy of the Indian state. Incidentally, in this regard it needs to be noted that the erosion of the authority of the state is by no means a precondition of the centrality of the market under a regime of liberalisation; the integration into the world market also need not be as dictated by the global actors on the scene; the state need not lose its autonomy everywhere as a necessary prerequisite of the march of globalisation. What has happened in reality in several countries – is found, for instance, in South Korea, Taiwan, Japan, more recently in Malaysia and most strikingly in China – is that the state and the market reinforce each other under the domination of an elite that both makes use of the TNCs and succeeds in undermining dissent in the political sphere and institutions of civil society in the social and cultural sphere.[10]

Those who believe that things like liberalisation and privatisation simply mean replacement of the institutions of the state by those of the market seem to be living in a make-believe world that has been promoted by the information and communications blitz let loose by global centres of corporate power intent on weakening and disempowering the state in the third world and which also comes in handy for the new emerging nexus between a set of politicians (or technocrats turned politicians), bureaucrats and businessmen. The fact that even ordinary people begin to accept such make-believe is understandable given the vacuum – both ideological and political – that has followed the virtual dissolution of the third world, both as an idea and in reality, the actual (not just virtual) dissolution of the socialist bloc and in quite a different way, the slow decline of the idea of social democracy based on the welfare state and the post-Keynesian model of western capitalism. Both the trilateral conception of an integrated capitalist attempt to meet the challenges of communism and OPEC-style third worldism, and the new model of interdependence following the collapse of the Soviet Union have been attempts to fill this vacuum (just as the decline of real democracy in plural societies

like ours has created a vacuum that is being filled in by religious and sectarian ideologies)

Future Prospects

It is with respect to this decline of the nation state as an instrument of social transformation on the one hand and as an embodiment of distinct (if not sovereign) political entities on the other and this in the larger context of a growing ideological vacuum globally that one has to assess the prospects for the future. There is on the one hand the likelihood of moving away from the conception of a world composed of distinct nation states and diverse political cultures towards one that calls for their integration into a so called world order while on the other hand the same nation state will be subjected to increasing challenges from the grass roots and diverse peripheries and regions both these tendencies eroding the autonomy of nation states like India. The integrative trend is going to be backed by organised interests and resources both financial and political while the democratic trend towards a more pluralist and decentralised structure is likely to be backed by the power of numbers and their growing consciousness of rights. The first (integrative) trend will be for creating a common future for the global middle class and will end up leaving a large part of humanity out of the historical process and out of both the institutions of the state and the transactions of the market. It is also a trend that is likely to produce an increasingly centralising and a potentially authoritarian structure of governance. Also the more the integration of the nation state and national economy with the global system the more the alienation of the ruling strata from the peoples communities and nationalities round the world.

The same will happen within the country the more centralised the state will become the more distant it will get from the grass roots and the diverse communities and nationalities. As both these trends (global and within the country) converge large sections of the people will be left with no option but to join a growing culture of revolt and rebellion strikes and dharnas and 'bandhs most of them peaceful but a number of them being forced to become part of a growing culture of violence adopting ever more angry and defiant modes of rebellion, revulsion and 'revolution'. The argument that those at higher levels tend to be more enlightened than those at local levels because they are able to take a more liberal and egalitarian view or that the proposed new structures at local levels (like panchayats) will be dominated by dominant social groups (castes) and hence should not be trusted, may be valid for some time, but not for long: once the democratic process gets going, the more numerous social classes will feel empowered and challenge the hegemony of the upper strata.

This is also the case with the argument that global institutions and elites being more enlightened than national and regional ones, there was need to transcend the nation states and other 'parochial' interests and institutions. This argument was advanced in all earnestness ever since the first world war, mainly with a view to restrain the aggressive element in human beings for creating a more peaceful and progressive world. It went from one worldism to a world federalist movement to (in recent decades) the conception of a 'world order' designed through a further extension of the United Nations framework through the availability of supra-national institutions based on a benign conception of international law known as 'world law'.[11] Today there are not many takers for this vision which has been rejected for being too romantic but also because the worldview on which it is based has been hijacked by global capitalism and its effort to colonise the whole world once again. 'world orderism' too has been hijacked by the 'new world order' of Bush and Clinton. It is also a worldview that is being advanced to contain the democratic upsurge round the world through an ideological package (liberalisation privatisation and the rest) for integrating the middle and the upper classes everywhere with the simple aim of retaining and enhancing the privileges and perquisites of these classes. There should be no mistaking the political motives behind the emerging attempt to defeat the struggles for autonomy and self determination, waged not just by third world intellectuals seeking autonomy and self reliance for their nation-states but also, and more stridently, through mass uprisings (both ethnic and economic) within individual societies.

It is in light of this growing tendency (both politico-economic and ideological) of integrating the whole world in the framework of world capitalism and western hegemony that we have to think of the likely future of the nation state in India and in similarly placed countries of the third world. Three important trends need to be taken note of. First, there is a marked rise of sub-national consciousness overtaking the earlier kind of nationalism that included diverse regional and cultural identities. There is a growing revolt against central authority as well as, in some areas, against state governments, producing a highly unstable situation. The 'centre' is increasingly unable to hold against the growing challenges to its authority, its nervous attempts to suppress this by recourse to paramilitary forces and the army (whose increasing use in one region after another is also proving an unsettling factor) only underlining its inability to hold.[12]

Second, the national elite, as it becomes more and more unable to cope, tends to turn away from the basic political challenge of nation-building and the related economic challenge of 'development'. It is increasingly losing interest in intervening against vested interests, reversing the large disparities that exist and are growing, and undertaking a model of growth that fulfils minimum needs of the people, reduces inequities and injustices, in the process taking along dissatisfied social strata and regions and minimising social tensions and violence. The new generation of elites seems to be giving up on these two challenges - nation-building and development – and turning to international and transnational agencies to bail them out. The growing accent on technology as the pathway of development has necessarily led to moving away from self-reliance and towards dependence on external forces (which is then called 'interdependence'). It has also led to moving away from political representatives of the

people defining the conduct and direction of the state and its agencies to handing this back to the bureaucratic 'apparatchiks' of the post colonial state very much in line with the colonial legacy – now in fact becoming doubly colonised by deepening the dependence on external forces through national elites willingly submitting to their dictates in deciding upon national priorities and objectives [13]

There is third, something we referred to earlier namely, the rise of new organisational forms that are transcending states and nations, representing almost a mutation in human evolution These consist of transnational corporations possessing enormous financial and technological resources and a series of bilateral and multi lateral compacts providing for regimes of security aimed against insurgent movements from below together producing a new institutional apparatus for running the world which then is called a world order [14]

Challenges Facing State and Movements

It is against these changes in the historical context of a nation state like India especially given its multi cultural and multi national nature that its survival will depend To a large extent the future of the nation state in India depends on whether it becomes still more centralised and run from the centre' which then makes it an alien presence and also makes it an easy target for global interests or it becomes increasingly democratic internally and on the basis of that inner strength plays a democratic role externally The nation state in a highly complex world full of contradictions and tensions has to become a catalyst for voices of diverse cultures and peoples and thus give rise to a dispersed and decentralised world order preserving the integrity and the uniqueness of each and the pursuit of distinctive goals and ideologies and giving rise to a consensus that is derived from respect for such diversities Its role should be to intervene in the larger world and the various global forces at work The challenge it faces is to restore this historic role away from which it seems to have strayed for the last several years

The challenge to restore such a role to the nation state faces not just national and state level elites but also the various sub-national identities and movements There is a need for the latter to realise the real sources of exploitation and homogenisation of all nations and peoples, which happen to be increasingly global It is in the creation of a multi-cultural and plural state organised on federal lines that their goals of autonomy and self-determination can be better realised, rather than by undermining the legitimacy and authority of the state Fighting against the state as such will only reinforce the repressive tendencies in the latter, opening its doors to transnational and global enterprises and military-security compacts Once this process gets under way (it has only begun of late), there will be little scope for the success of democratic movements within the country Undermining the legitimacy of the nation state will only facilitate its surrender to global actors that are yearning to make the whole world accept their model of 'world order It is necessary that the increasingly beleaguered nation states and the increasingly oppressed social strata and ethnic and regional groups work towards a common future which will enable them both to withstand the challenge from transnational and global actors The main responsibility for this falls on the leadership of the nation states, but the movements too (especially those concerned with human rights) need to press upon the former the need to safeguard their autonomy and self-reliance in an increasingly globalising framework of development and governance [15]

But of course for this to happen – for the movements to trust the centre or even the state centres – the nation state needs to be organised differently than has been the case so far The basic task facing the national elites is one of regaining legitimacy for the state accepting for this purpose the reality of it being a plural entity restructuring internal democracy along federal (if need be confederal) lines and resisting external pressures for downgrading the state in the development process In short there is need to think of nation states like India to be elements in a large federal continuum from local (village to district) to sub regional (states sub-states) to national to supra regional, to global [16] Such a federal conception will also involve a federation of diverse social strata, many of which are still suffering from grave injustices and growing disparities Incidentally, this is also the only way of defeating fundamentalist and fascist tendencies based on religious and other sectarian appeals [17]

In moving towards such a structure of the state, as well as of the world at large, it is not only necessary to restore to the nation state its historic role based on the clear acceptance of the federal perspective on democracy it is equally necessary not to be taken in by the growing charisma of the market, the ideology of privatisation, the miasma of consumerism, and the yuppy culture In India the power of market forces and consumerism can already be seen even in the state-run Doordarshan Many institutions of planning, development and finance are also already being run at the behest of the corporate sector The domination of the private sector (increasingly corporatised and transnationalised) is already on the upswing, alongside the growing role of the mass media controlled by it and the ad agencies through which people's choices and tastes are being shaped Given a chance (now especially with the emphasis on privatisation), these forces will replace democratic politics by emphasising technological fixes

It is important for us to remember that even in the west it became necessary for the state on the one hand, and trade unions, consumer and lately, environment and women's movements, on the other, to ensure distributive justice, environmental ethics and affirmative commitments, obliging industries professional business houses, universities science and technology establishments and market-related agencies themselves to abide by the laws of the state We must also not forget that, left to itself, the market in the west had let loose oligopolies and cartels speculative share markets and trade cycles that produced the great depression from which Keynesianism proved to be the only way out It is important for us to understand the pathology of a development process based on the market before we decide to throw away the advantages of a comprehensive process of state and nation building and a corresponding political economy in which a central role is assigned to the state We must of course deal with the pathologies unleashed by the state but not fall for still worse pathologies [18]

Pathology of a Political 'Development'

The most basic of these pathologies is the one that has grown out of the very model of market-based economic growth, pursuing the goal of generating accumulation and wealth, unrestrained by the interventions of the state, oscillating between periods of expansion and contraction, producing speculation in the stock markets and moving headlong to the final crash not terribly different from the great depression of the 1930s, only now on a much more global scale than was then the case This is what is being currently offered to us (our own scam in the early 1990s being seen at the time when it occurred as proof of the success of the new and reformed economy) [19]

We need to remember given the historical experience, that such a model of economic growth (unrestrained by political will) necessarily reproduces all the major features of the aggressive and totalistic worldview underlying the western idea of progress [20] When it was first enunciated and for a long time after that, it was sweeping, full of

confidence and elan, recognising no obstacles, willing to eliminate anything that stood in its way, whether this be in the arrangements of nature or in the arrangements of society – it was neat mathematical definitive with all the questions answered and all the answers laid out in a clear-cut manner It brought about rapid changes in the composition and structure of world social reality, released great energy, led to a huge apparatus of governance and hegemony over diverse regions of the world, toppled regimes whenever it became necessary through military invasions if these were called forth put very large numbers of people and entire societies and cultures on the defensive, prompting so many of them to discard all that they had stood for and identified with for something wholly new with the accent on novelty movement and change for their own sake Following the traumas of the inter war period and after the challenges posed by the Soviet Union and later, the political rise of the post-colonial world, in particular following the Maoist revolution on the one hand and the OPEC crisis within the capitalist economy on the other its confidence was shaken and it entered a period of self-doubt and scepticism Of late the confidence has resurfaced almost with a vengeance against the very course of history (hence the new confidence of the end of history' thesis)

There are several facets of the renewed dogma of development' (the latest incarnation of the idea of progress) for rearranging human affairs which need to be borne in mind It is impersonal, dealing not with concrete human entities but with abstracted, aggregate categories and quantities It is impervious to the political process and to the need to first build civic communities, states and nations, in short it is fundamentally apolitical In consequence, it has gradually become inimical to any large scale participation of the people and decentralisation of power, has supported a high degree of centralisation verging on authoritarian governance, and in the process eroded the diversity and plurality of traditional societies a model of centralisation that is not bureaucratic in the traditional sense (which at least had a degree of institutional accountability based on certain rules and conventions and red tape) but is based wholly on technology fixes that are not accountable to any institutional arrangements Finally, as it is giving more importance to the processes of world accumulation than to distribution and dispersal of economic and technological resources across regions and classes, it has bottled up human energy and technical skills while at the same time making nation states increasingly dependent on foreign investment, 'aid', technology transfer (as well as transfer of the dominant technological model), the role of the TNCs and its techno-bureaucracy growing indebtedness, and the tying up of national security with global doctrines of security and 'defence' All these external stimuli are producing powerful internal effects in most third world societies, namely centralisation of governing structures rampant urbanisation and metropolitanisation (both vertically and horizontally) destruction of traditional resources and sources of knowledge and techniques all this together moving towards the end logic of the global development paradigm a decline in legitimacy of pressures from below and its substitution by the prestige and influence of those from above

It is this combined pathology of a dehumanised development paradigm and an increasingly centralised and alienated paradigm of an increasingly technocratic state, that we will need to deal with if we are really to come to grips with the overall crisis of governance faced by the people of these various countries as opposed to the crisis of governance as perceived by sections of the elite and the intellectuals who feel disconcerted at the growing challenge from the people and the grass roots This manner of posing the issue will take us to some of the most important issues in political theory, enabling us to disaggregate existing propositions in it which are based on the assumptions of the development paradigm and, instead, moving to a different set of propositions that are vital for the sustenance and defence of the democratic enterprise through the maintenance and strengthening of civic structures – the state, political parties, other institutions of governance of a humane and decentralised kind producing in their wake too a global setting which ensures the survival and sustenance of this enterprise. The dramatic shifts and turnarounds in recent history (which happen but once in half a century) are calling for a whole range of theoretical reconsiderations on the relationships among power, ideology and institutions that over time could well provide new thresholds of conceptual understanding, putting an end to the simplistic thinking that has long been taken for granted and instead giving rise to new and discriminating concepts and definitions Such an alternative intellectual effort will in turn demand alternative structures of the state and systems of governance, for without them the scope for alternative perspectives and knowledge systems and theories of intervention (based on new modes of consciousness) will not be easy to bring about

Paradoxes of Power

We face an almost 'necessary paradox' here powerful states and political structures become necessary for waging ideological battles on behalf of the weak and the oppressed containing the aggression of dominant centres and producing new 'checks and balances' in the global structure of power and authority The same process becomes necessary within the domestic setting, too, both within the states of federal system and between the states and centre The lessons of the last five years in the global setting of power resulting in the recent forays of aggressive posturing of the US are precisely this The Soviet Union may indeed have been internally oppressive and undemocratic but proved highly relevant externally in safeguarding the interests of the globally poor and the position of the deprived and isolated centres in the third world To be sure, the assumption that what Stalin had

built was invincible has proved to be a grand illusion Instead, the seemingly fragile and shifting institutions of US democracy have proved more stable On the other hand, the democratic commitment of the latter has been far less available for human progress and emancipation When today we find ourselves beseeched by the pressure for carrying the US message of democracy and human rights globally we may indeed be in grave danger

For what we face is nothing short of a war being waged in the name of democracy, beginning no doubt with the inter war battle between democracy and fascism a mandate that was picked up across the Atlantic making the world safe for both peace (following Woodrow Wilson) and democracy Soon however the idealistic overtones of this were dealt a mortal blow by the so called realists of state power following the Churchillian rhetoric of fighting a cold war in defence of democracy combating communism globally and promoting the aid and trade and transfer of resources based consolidation of capitalism (a euphemism for democracy) powerfully backed in the first instance by the Marshall plan From there on to bringing democracy to the third world through development first as part of the new state system through foreign aid from the north to the south under the Truman doctrine and later as this tended to bolster the state as an instrument of change through free trade liberalisation and human rights under the Reaganite impact Following the end of the cold war and the launching of the new world order offensive the world seems to be all clear for democracy

All that remains to be done is to carry the fight for democracy to a new civilisational pitch namely fighting the Islamic and pan Islamic the Confucian and the Hindu worlds (and worldviews) basically by advising the national elites in these regions to dismantle the institutions of their respective states and replace them with the new religion of corporate capitalism It would seem that to occupy a less arrogant role in the worldwide struggle for freedom and democracy is difficult for the Americans given the character of the American psyche It cannot wear a role assigned by history in a light, indirect soft and subtle way as was the case with the less idealistic but more sophisticated Englishmen, the Dutch and even the French, it is the 'Ugly American' syndrome all the way down to even the most sensitive areas of human endeavour [71] The result could well be that human rights will continue to be a minor cousin of the American espousal of trade, aid, preferential treatment and transfers of capital, tying up countries engaging in human rights violations through opening them up to western penetration without any real improvement in the human rights situation facing the poor and the oppressed sections of these societies [72]

Future for Democracy under Globalisation

That brings us to the heart of the matter how in a world so deeply divided by the phenomenon of poverty growing injustices and inhumanities can genuine human rights and democracy be promoted without recourse to the political process, both globally and within nations? We are in the presence of a global corporate enterprise that has divided the world between regions that have been globalised and regions that have been left out of the process of globalisation Increasingly the former are impinging upon the latter through a variety of technological fixes financial speculations and scams and a growing tie up between international trade and banking and local corruption and criminalisation within the latter hijacking both economic and ecological resources large chunks of agricultural land and co opting peasant interests on the one hand and professional middle classes in the urban areas on the other all with a view to integrate the globalised world and edge out the non globalised one by disenfranchising it under various conditionalities' But at the same time the latter is not allowed to fully opt out of the globalising thrust delink from it and seek an alternative future the globalised elite can tick you off but you must accept its hegemony

In fact the project of globalisation does not permit any alternatives It is fundamentally proposing a strategy of organising the world which brooks no challenge from without (in terms of alternative power structures) or within (in terms of social movements like environment and human rights) both of which have been denuded of their capacity to join forces and align into one common macro challenge The point is that movements' by themselves do not build power structures (even if they were not as fragmented and rendered politically impotent as they are today) On the other hand the sequence of political developments starting with the 'end of the cold war followed by the Gulf war and the doctrine of a new world order , the games of political and military interventions in vulnerable regions engineered through the United Nations the political use made of conferences like UNCED held at Rio and the human rights conference at Vienna and of course the signing of the GATT agreement at Marrakas, does make for a concerted effort towards a macro design of globalised politics

The overall result is that regions and peoples – and states – that are not integrated into the globalised framework stand marginalised and excluded Globalisation and marginalisation are two counter images of the same phenomenon, marginalisation being a necessary condition of globalisation while globalisation provides an existential framework in which millions are marginalised, felt unwanted and considered dispensable [73] Incidentally, even the day dreamers of a single unified world – the one worlders world federalists as well as the more recent proponents of a peaceful and disarmed world order' for creating a 'just world – have all, lacking a social philosophy and a truly political alternative model, ended up endorsing global structures of inequity and exploitation essentially pinning their hopes on technological revolutions, such as the modern communications and information order that are supposed to 'unify' humanity but have in the end subjugated it under a technological paradigm that has only strengthened the global structure of hegemony and aggrandisement [74] Some of them were well meaning and none of them had the sophistication and chicanery of the most recent advocates of a world order, who are at once devoid of any unifying perspective or even a balance of perspectives out of which a semblance of order and 'stability' can be expected so that the 'wretched of the earth can expect some openings for their survival and hope for a better future Instead what they are in effect proposing is that the rest of the world accept a colonised status and bargain their freedom and independence for a minimum desert of survival and security in short, a new 'social contract' under a global Leviathan but unlike with Thomas Hobbes not for all individuals and indeed at the cost of millions of them Hobbes was a far more enlightened vision than is likely to be Clinton's, even if we accept that the ghosts of Reagan and Thatcher have been pushed in the background and instead we have a truly globalised and not necessarily fascist gendarme in power who believe that theirs is a different model of *realpolitik* which is meant to secure genuine stability security and peace!

In reality quite a different 'global' trend seems to be emerging – of 'nations' breaking down without getting regrouped into some macro-alternative formations There is of course the grand upsurge of ethnicity and new assertions of nationalism and sub-nationalism, of a series of civil wars and larger wars in the making posing the challenge of new political alignments that may or may not be peaceful or non-violent; of nuclear proliferations of the most dangerous kind, accentuating diplomatic warfare that is preventing de-escalation of regional violence and terrorism', all of this

being handled by new and cynical power groupings, none of which provides a pleasing spectacle and indeed throws one in moments of despair in which one may even want a 'global' solution One may still hope perhaps to produce a new vision for this, building in part on the original post-war vision of liberation, equity and peace while resuming the project of the nation state that emerged from the ruins of the war but transforming it and humanising it making it less repressive and on that basis mobilising the people for a genuine people's world order But this is a Herculean task that will face serious obstacles given the powerful forces at work for the other model of globalisation in which fragmentation becomes the basis of 'integration

The best face that that model can put on is based on two sets of claims – de-escalation of the arms race and integration of diverse economies into a global market oriented model of economy and technology Such a model has attracted many inluding leaders and intellectuals of the third world However, with the best of intentions these two claims can only work at cross purposes, the 'global economy' making all nations but a few continuously indebted, forcing them to take to either highly hazardous forms of industrialisation or to the war industry itself (the borderline between these two being very thin), including manufacture of nuclear arms (China, Iraq, Isreal Brazil India, Pakistan), in turn inviting either a regional or even a 'global' (which means great power) backlash There will be nothing global' in such an encounter in the sense of transcending national or regional interests In the famous words of Toynbee, "globalisation means integration into the dominant centre, not a multi-lateral process" Whether one likes it or not, globalisation does in the end involve globalising security concerns and, knowingly or inadvertently getting hooked into military and intelligence networks of global 'interdependence This is also the case when one thinks of the emerging nexus between national chauvinist drives and the international regime of liberalisation-cum privatisation, be it in Tibet or Kashmir or through the suppression of ethnic minorities in Iran, Iraq Indonesia and the like

Pax Americana

On all of this the principal actor in the gameplan of globalisation is the US, irrespective of its economic weakness at home and the challenge posed by other major powers like Japan and Western Europe to its hegemony For only the US has both a global vision and a global strategy Also, as things stand in all theatres of the world – US-EC, US, Japan, north-south and what remains of east-west – only the US seems to call the shots One has just to consider the freshness, youth and vitality as well as the intellectual power available to the Clinton administration as compared to Mitterrand, Kohl, Yelstin and the Japanese cabal of corrupt politicians feverishly engaged in throwing away the country's technological prowess and financial and trade positions, and one can see the contrasting images that are found to permeate the global political process Meahwhile all the major gains from the spread of liberalisation, whether in Jamaica, Argentina, Vietnam, India, China or Russia, whether diplomatic or strategic, have gone to the US Also, in terms of the new strategic and military thinking and planning, the major initiatives are again likely to come from the US whether this be in the republics of the former Soviet Union or the former Yugoslavia, the Islamic and pan-Islamic world, the Israel Palestine issue, even south Africa, and above all with respect to Chinese expansion itself And, make no mistake it is the US state in collaboration with the corporate capitalist giants that constitute the new Pax Americana

All this is gaining legitimacy in the name of democracy. And, as hinted earlier, it is not democracy in the sense of a multi-polar, multilateral, pluralist civilisation Rather, it is democracy at war, not any longer winning friends and influencing people round the world but rather co-opting power structures all round the world, utilising both the models of state power (in terms of a statist 'world order') and corporate power (of the economic and technological type buttressed by the only real 'global' institutions, not the UN but the World Bank, the IMF and the World Trade Organisation launched by GATT) We have thus a joint project of permeating diverse states by a global market and destabilising the political and administrative structures of those very states that once posed a challenge to western hegemony but are today willing to accept that hegemony except in name Whereas the market beomes the vehicle for their subjugation to a global world order, this being the latest phase of both imperialism and capitalism, the political benefits of this will percolate to the US [25]

The point is that most of these are not the states as we have known them, nor is it the 'free market' as it is being advocated It is

General Editor: Ashok Mitra

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints

a different model of a state aligned with a new model of the market. Underlying both is a mind set of global homogenisation that is out to both delegitimise and dismantle sovereign states round the world while also excluding from the global arena a whole variety of communities and cultures and literally billions of people: women and children, old people as well as the new generation of the young, the tribals, the forest dwellers, the landless and bonded labour in the rural peripheries and migrant labour in urban slums, the poor and discriminated sections everywhere. The process has been going on for long but has become particularly aggressive following the radical restructuring of the 'world order' after the collapse of the Soviet Union as a composite state, the decline in both power and self-pride of so many nation states of the third world, and the new lease on life that the old maxim of divide and rule has acquired by making clever and diabolic uses of the new expressions of social and ethnic diversity and of political and cultural pluralism inherent in it. It is a mind set that seeks to roll over the grand panorama of both natural and human diversity and community lifestyles into one mammoth overriding structure.

Decline in Resistance

Surprisingly, it is a mind set that is not only being resisted sufficiently strongly by the affected states and nationalities that have everything to lose before this sweep of globalisation, but is rather being accepted with folded hands. It is the same attitude of a new kind of fatalism that seems to be passively accepting the onset of major catastrophes and growing risks Growing desertification following a mindless model of 'growth', alongside global warming at such a fast pace, poses almost an agenda of collective suicide. Meanwhile, as I have laid out somewhat graphically in my 'Democratic Civitas',[26] the condition of children and women is fast declining and endangering their very survival with honour and dignity. The growing violence resulting from the consumerist ethic of an acquisitive society and the murderous competition that it breeds has already been referred to earlier in this paper. (The environment movement is paying less and less attention to this, perhaps because of the growing influence of money power and permissive lifestyles on environment NGOs and the 'activists' dominating them.) Much of this is known yet there seems to be a continuous seduction by the capitalist corporate mind set which is stretching all over the world – the socialist world, the third world, the welfare states of the west – including among the 'representatives of the people' (both elected and self-appointed as with the NGOs), who know that the material benefits of this model will be available only to a few, that the large masses are being deliberately excluded and left out, that this is bound to generate turbulence and animus and strife, and the result will be politically destabilising.

This will, in particular, be the case with relatively open and democratic societies where the imposition of the global juggernaut will affect the very freedoms that they have for long cherished. Their elites seem to be falling prey to the 'catching up' syndrome that is increasingly forcing its way, using coercive techniques and making entire governments subservient and servile. What is being advocated is a notion of unity and interdependence of the world. What makes it palatable, though, is that this is to be achieved through cut-throat competition and rivalry using whichever means that works Shorn of all values, it is once again (as in the 19th century) finding merit in making the world and the power structure in it a domain for the survival of the fittest

And as the fittest survive, those not considered 'fit' and 'meritorious' and 'deserving' must of necessity be considered dispensable. It is almost like some inevitable law of history being played out – a law before which all the talk of equity and justice, or the old-fashioned notions of compassion and pity, appear meaningless and, of necessity, provoke so much cynicism. This cynicism in turn lends weight and merit to the growing attitude among so many of disdain and contempt for the lowly, embarrassment at the presence of so many poor and destitute, unemployed and unemployable, found in whirlpools of debt – squalor and disease – and of crime. Such an attitude is not some bizarre or irrational psychic state. It is the net result of growing polarisation between a minority backed by massive resources, power and the capacity to mislead and condition people's psyches, and a vast majority that is economically weak, socially divided and politically pushed to the wall but as yet unable to struggle together for evolving a common strategy to deal with the challenge posed by such a polarisation.

Meanwhile, concepts and movements that had been developed for the defence of the weak have been marginalised and co-opted one after another and thrown on the defensive – the idea of the 'South' and of 'South-South', the confidence gained by the 'South' from the time of the OPEC challenge and its alignment with the non-aligned movement, the idea of a new international economic order (NIEO) and of G-77 utilising the UN as a forum for pursuing development strategies that could lead to 'collective self-reliance', the widely argued and (even accepted concept of 'alternatives' and, for this, the vehicle being the independent nation states of the third world. Erosion of the capacity and confidence of the latter has led to a still more massive and deep polarisation – between not just a prosperous and powerful north and large parts of the south that are steeped in poverty and a fragile power base, but also between a north that is able to enjoy greener pastures and regimes of peace and relative tranquillity and a south that is getting increasingly polluted, noisy, violent and crime-infested. The former has over time succeeded in exporting and 'transferring' not just hazardous technologies but also pollution, violence, drug addiction – and dung!

Co-optation

The irony of course is that global centres of hegemony are fast adopting the large variety of concepts and ideas that had emerged from the alternatives thrown up earlier by third world and the former socialist world and by the diverse movements of social change and protest. Indeed, the great bearer of these latter, the NGO, is being made an agent of the proposed integration, unity and interdependence. The state is to be sidestepped, the so-called voluntary agency and the NGO is to be promoted and the various 'movements' – peace and environment in particular but parts of the women's movement too – are to be adopted as agendas of the new world order. What had started as micro movements located in diverse communities and plural settings or had been conceptualised by some third world intellectuals belonging to the 'alternatives' school has now got hijacked by technocrats of the global NGOs. With this environment becomes 'management of natural resources' rather than struggles to retain people's rights over natural resources. Peace is to be perceived as a technology fix[27] and a result of technical interventions by the only remaining superpower. As for the women's movement, it is to be gradually co-opted through the technology of global conferencing and heavily funded projects. Also, many of those who gained legitimacy by participation in, and closeness to, grass roots struggles are to be co-opted (indeed have already been co-opted) in the global NGO framework, essentially by being invited with open hands by academic centres and international NGOs in the north, dishing out huge honoraria and per diems.[28]

Common to all of this is an undermining of the political dimension of these movements and struggles and the diverse cultural and ethnic settings in which they are to be waged. Paradoxically, the project of undermining

the state – the institutional embodiment of the polity – also becomes a project of depoliticisation of both the state and the 'movements' that are engaged in struggles against it In fact, the ongoing process of co optation may well take us back to the Reagan Thatcher legacy of downgrading the state and with it the democratic process as well

The democratic upsurge has of course its own logic which is bound to keep raising its banner even if it is unable to withstand in the short run the combined backlash from centres of imperial power and corporate capitalism The NGOs may not prove to be the best vehicle for the democratic movement and against the globalising juggernaut Perhaps the main counter to both globalisation and the erosion of independent political structures will come far more than from the grass roots movements from local and national political spaces, consisting of socially peripheral but politically ascendant groups and communities, castes and classes, and nations in the making In short micro movements occupying macro spaces across local, national and regional terrains It is through such stirrings of civil society that we may also witness new models of 'alternatives' that have been provided by either the bourgeois liberal or the Gandhian or the traditional left ideologies or the new social movements' represented by the NGOs [2]

Notes

1 Francis Fukuyama *The End of History and the Last Man* Free Press New York 1992

2 There has been a longstanding concern in western liberal thought about the dangers of mass society and mass culture and of the rise of demagogy based on a crowd psychology that may be inherent in them of the passions and temptations to which revolutions give vent and of the excesses of populist politics in our own time Burke and Tocqueville Durkheim and Freud Nietzsche and Camus among others have dwelt upon various implications of the rise of the mass society and revolutionary politics These concerns have of late been reflected in India too especially following the growth of populist politics from the 1970s onwards Building on these fears though has been the rise of the present dominant tendency both in the west and in India that is aimed against the growth of democratic politics based on class (caste) ethnic and other grass roots identities and making use of the anxieties to which all these give rise against dissent as such

3 When in the final round of negotiations on the GATT agreement some western countries pressed for acceptance of minimum labour conditions (wages ban on slave labour child labour etc) and the environment prompted no doubt by trade union and other pressures in the west for restricting trade inflows from the third world there was a hue and cry from the governments of most of the G 15 countries which suddenly, after proving so pliant and submissive on 'structural adjustment' were found to indulge in anti western (especially anti American) rhetoric Significantly, as opposed to spokesmen of western governments (led by the US vice-president Gore) western TNCs were pressing the G 15 governments to continue or adopt repressive policies vis a vis labour

4 See my 'State and Statelessness in Our Time' *Economic and Political Weekly* Annual Number Vol 26 (11 12) March 1991 and 'Rise of the dalits and the Renewed Debate on Caste' *Economic and Political Weekly* June 25, 1994 I have dealt with the whole paradox of disempowerment of the people of institutions of the state and of the state by global structures of world capitalism and hegemonic politics in several of my writings See in particular *State against Democracy In Search of Humane Governance* (Ajanta Delhi 1988) and *Growing Amnesia An Essay on Poverty and the Human Consciousness* (Viking (Penguin) New Delhi 1993) especially the chapter on 'The Political System and the Poor'

5 On the theme of creating a nation state by encompassing diverse identities instead of imposing a transcendent structure see 'Hanging by a Fragile Thread' *The Telegraph* Special Anniversary Supplement July 14 1994 On the failure to make such a conception of pluralism socially representative see my 'The crisis of Representation' *Hindu* August 31 1994

6 For the concept of intermediate aggregation and its operation through a unique party system see my earlier work *Politics in India* (Orient Longman Delhi 1970) The article 'The Congress System in India' which is how I had described this party system in 1964 has been reproduced in my *Politics and the People In Search of a Humane India* (Ajanta Delhi 1989)

7 I have argued elsewhere (*Seminar* Annual Number January 1992) that the 20th century has already come to an end Quite distinct from the statist overtones of the idealist school of philosophy in England even the classical liberals were inspired by such an aura of the state Walter Bagehot's classic *The English Constitution* laid this out in a subdued yet powerful way the majesty of the state served by a balance of institutions and procedures

8 The artificially imposed borders and boundaries within and between nation states and the equally artificially imposed centralised colonial regimes which were continued after independence are finally coming to roost in large parts of the third world as well as in parts of the western world and most strikingly in the former socialist world The growing volatility of electoral politics in countries as diverse as Japan Canada the US (the Ross Perot phenomenon) Russia (the Zhirinovsky phenomenon) Italy and Germany as well as the traumatic events that have overtaken countries carved out of former Yugoslavia Czechoslovakia and Georgia (and the near total failure of powerful countries and the UN to stem horrendous tides of murder and starvation in Somalia and Rwanda), highlight the fast spreading upsurge of ethnicity and sub-nationalism For a theoretical analysis of the theme, see my 'Ethnicity' in *Rethinking Development In Search of Humane Alternatives*, Ajanta, Delhi 1988, and Aspect, London 1990) For an interesting perspective on the rise of civic discontent and its implications for the stability of nation states in the west see Charles S Maier, 'Democracy and Its Discontents' *Foreign Affairs* July-August 1994

9 These roles – and generally the crucial importance of the social objectives of the system have received inadequate attention given the overwhelming sway of economistic thinking but they have been amply laid out in the constitution both under the directive principles of state policy and under the chapter on fundamental rights as well as in a series of articles dealing with the role of the state in the protection and welfare of the tribals the minorities and the socially deprived strata I had attempted to emphasise the social dimension as part of the country's planned efforts in the draft chapter on 'Social Policy' in the Eighth Plan document under the National Front government (with the assistance of Shekhar Sharma) It was accepted by the other members of the Planning Commission but subsequently dropped by the reconstituted commission after the fall of the V P Singh government It is now part of my *Growing Amnesia* op cit For a well documented critique of state policy from the point of view of the rights of tribals and dalits, see B D Sharma's report to the president in his capacity as commissioner of scheduled castes and tribes which has recently been republished as *Dalits Betrayed* (Har Anand New Delhi 1994) I have restated the theme in my contribution to the compilation entitled *Indian Society Today Challenges of Equality Integration and Empowerment* edited by Muchkund Dubey prepared in connection with the UN sponsored Social Summit to be held in Copenhagen in March 1995

10 There has been of late a great deal of talk about a unique Asian model credited with not only high rates of growth but also one that had enabled the east and southeast Asian countries to march ahead of the west, also bringing into play a new kind of statecraft that had been pulling even hegemonic powers like the US on the defensive (e g by Japan on the trade front on the one hand and China on the human rights and democracy issues on the other, or Malaysia on the environment front) This has also led leaders of some of the NICs, such as Mahathir bin Mohamad of Malaysia, to raise the banner of third world militancy of the right (as opposed to third world militancy of the left that was espoused by people such as Nasser, Nkrumah and Soekarno), engaged in a friendly encounter with the west following the logic of free trade and integration into the world market but at the same time asserting their right to wield the power of the state as these leaders

and the regimes (or parties) over which they preside deem best (e g, China *vis-a-vis* the rights of Tibetans or the dissent of the youth in general). In the process they have also managed to command a large array of intellectual and media support, including, interestingly, some sections of the left intelligentsia. This also comes in handy for the structural adjustment lobby, both within these countries and in the west, and the latter-day camp-followers like the Congress regime in India reeling under the Bonapartist sway of Manmohan Singh.

11 The idea of world order, which is today seen as a strategy of global dominance, was for long an offshoot of western progressivism in the form of liberal internationalism, arising from the growing disappointment with the states system following the end of the 'balance of power' phase of world politics with the first world war It got a further fillip after the experience of fascism on the one hand and communism on the other. This drew in particular upon a branch of the discipline of international law that thought of promoting "world peace through world law" as a model of both conceptualisation and research. A book of that name by Grenville Clark and Louis B Sohn (Harvard University Press, first published in 1956) had a considerable influence in the US and in world federalist circles in some countries in Europe. An institute called the World Law Fund was established in the 1960s, and leading experts in international law, Saul Mendlovitz and Richard A Falk among them, launched a research project called the World Order Models Project in which scholars from various parts of the world (Ali Mazrui, Johan Gattung, Yoshikazu Sakamoto and the present another among them) were invited to participate. This led to a series of publications which provided a variety of regional 'models' of world order This led to quite a few dissenting worldviews (as against the world federalist one) and 'models' of change and transformation in the prevailing 'world order'. Both in my *Footsteps Into The Future* and in subsequent writings in the journal *Alternatives*, which I edited for the first 10 years, I had expressed my differences with the western exponents of world order. I left the project in 1993.

2 'This Centre Cannot Hold', *Seminar*, Annual Number, January 1993,'Hanging By a Fragile Thread', *The Telegraph*, op cit.

13 For a fuller treatment of this theme, see my *Growing Amnesia*, op cit, especially the chapters called 'Overview' and 'Global Setting'.

14 For a somewhat comprehensive treatment of the role of the state under the new global corporate model of capitalism, see my 'Capitalism and the Role of the State' in Ghanshyam Shah (ed), *Capitalist Development: Critical Essays* (Felicitation Volume in honour of A R Desai, Popular Prakashan, Bombay, 1990.

15 I have dealt with various facets of these issues in my series of five books dealing with humane governance, alternative development and democratic politics, and the implications of these for a humane world order through 'transformation and survial', published in 1988-89 by Ajanta Publications, Delhi, also by Aspect Publications, London in 1990

16 In Gandhji's arresting language, "...it will be an oceanic circle whose centre will be the individual always ready to perish for the village, till at last the whole becomes one life composed of individuals, never aggressive in their arrogance, but ever humble, sharing the majesty of the oceanic circle of which they are integral units.. "

17 It is the search for simultaneous pursuit of these twin foci – regional and decentralised movements for democratic rights of various nationalities and cultural identities, and social movements for equity, participation and self-governance of diverse communities – that led to the formation of the Federal Front (now renamed Front for a Federal India), which held its founding conference on 'Federalism and Threats to Diversity' in Calcutta in 1986 and its most recent (10th) convention on the struggles of peoples and communities and regions in the north-east held in Guwahati in 1994 The Front is composed of a large network of grass roots and regional movements, left political groupings (including some M-L parties), human rights activists, and intellectuals committed to a comprehensive conception of the federal idea The author had the privilege of drafting the initiating document in Calcutta and has been associated with it along with other intellectuals ever since

18 See my 'State and Statelessness in Our Time', op cit; Growing Amnesia, op cit.

19 For a short but well-documented critique of the recent scam, see Seema Mustofa and Anuradha M Chenoy (eds), *The Scam: The Cover-Up and Compromise* (Wiley Eastern, New Delhi, 1995)

20 Much has been written on the idea of progress, the great battle cry of the European enlightenment and its enormous sweep across the globe For a theoretical-cum-historical analysis based on the literature that is available, see my *Footsteps into the Future* (Orient Longman, New Delhi and Free Press, New York, 1974). For a recent historical-cum-ideological overview, bringing the critique up to date and making it relevant for our time, see Amiya Kumar Bagchi 'Democracy and Development in Post-Soviet World', *Economic and Political Weekly*, December 31, 1994

21 Refuting Francis Fukuyama's thesis of the "end of history", the Harvard political scientist Samuel P Huntington has adopted the 'civilisational' route for carrying forward 'history', in short combating Islam, the Confucian challenge and Hindu India, treating them as the next set of frontiers (having already defeated world communism). See his paper in *Foreign Affairs*, Volume 72 (3), Summer 1993 For a sharp rebuttal from an Asian thinker, see Chandra Muzaffar, 'The Clash of Civilisations or Camouflaging Dominance?' *Just Commentary*, Volume 5, September 1993 There have been other critics too, including in the US. For Huntington's response to some of these see his 'If not Civilisations, What? Paradigms of the Post-Cold War World', *Foreign Affairs*, Volume 72, Number 5, November-December 1993.

22 That the government of India and many other governments in the third world (the Chinese being at the forefront of them all) are violating human rights cannot, of course, be gainsaid. That they are at the same time shielding their actions and policies through anti-imperial rhetoric and a new brand of G-15 diplomacy is also true. But none of this can offset the opportunism of US diplomacy on this front. See my 'Human Rights Offensive: Damage Done by US Support', *The Times of India*, April 9, 1994.

23 The theme was developed at some length in 'Of Humane Governance' in my *State against Democracy: In Search of Humane Governance*, op cit, and taken up further as part of a democratic of the state under the new critique development paradigm promoted by globalisation in *Growing Amnesia*, op cit

24 I had developed this critique first as part of the debate on world order within the idealistic camp of world orderism as found, among others, in the World Order Models Project This was first published in June 1979 in *Alternatives*, Volume 5(1), entitled 'Towards a Just World' and later as 'Justice and World Order' in *Transformation and Survival In Search of Humane World Order* (Ajanta, Delhi, 1988) As I had argued there, the new rhetoric of world order employed by the world corporatist elite "has sought to gain legitimacy from a radically different and fare more idealistic school of thinking in the US which is committed to world order", and "how, in a period of imperial retreat, new legitimisation is sought from dissident sources, how the paranoid strains in national culture converge with idealistic strains in the same culture to produce a new ideology in the defence of old interests" (emphasis added)

25 There are, of course, signs of growing divergence between the global imperial drive, located along the terrain of the states system, and the new global model of capitalism operating along a terrain that is apolitical and technological and independent of the states system. I shall be dealing with this divergence in my forthcoming book on globalisation. But there is also growing evidence that the United States is likely to improve its position in both the global terrains, of course paying serious social costs within the US (and not just worldwide).

26 Published in Ram Bapat and Pushpa Surendra (eds), *Critical Issues in Indian Society*, Earthworm Books, Madras 1994.

27 See my 'Peace as a Technology Fix' in *Transformation and Survival*, Delhi, Ajanta, 1988

28 On the overall scenario depicted in the last three sections, see my 'Yawning Vacuum: A World without Alternatives', *Economic and Political Weekly*, Volume 28 (22), May 29, 1993, and *Alternatives* Volume 18 (2), Spring 1993

29 I have developed the basic argument for such a new model of alternatives in my 'Rice of the Dalits and the Renewed Debate on Castes', op cit

SCHEDULE 17—NOTES TO ACCOUNTS

1. ACCOUNTING POLICIES
   a) **Accounting Conventions**
   The Financial Statements are drawn up in accordance with historical cost convention on accrual basis except in case of Commission on Guarantees & Letters of Credit and Payments under the Early Voluntary Retirement Scheme of 1988, which are accounted on cash basis
   b) **Foreign Currencies**
   Assets and Liabilities in foreign currencies, except for non resident deposits in FCNR (A) Accounts, are translated into Indian Rupees at rates current at Balance Sheet date as prescribed by FEDAI. The net exchange difference arising thereon is charged or credited to profit and loss account as prescribed by the RBI
   c) **Investments**
   Investment Securities are valued at cost plus discount, if any, accreted till date. Trading Securities are valued at lower of cost and market value as prescribed by the RBI.
   d) **Fixed Assets**
   Fixed Assets other than Premises (refer Note 2), are stated at cost less accumulated depreciation. Depreciation is charged on the straight line method, at rates higher than those prescribed in Schedule XIV of the Companies Act, 1956, as per the global policy of the Bank.
   e) **Advances**
   Provisions for doubtful advances have been made to the satisfaction of the auditors and in accordance with the norms prescribed by the RBI, based on a periodic review of advances, and after taking into account the portion of advances guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies.
   f) **Staff Benefits**
   Provisions for gratuity/pension benefits to staff have been made on accrual basis except for the liability mentioned in Note 3. Separate funds for gratuity/pension have been created.
2. Premises include an amount of Rs. 78,437,153 on account of revaluation made on March 10, 1993.
3. The liability pertaining to employees who retired under the Bank's Early Voluntary Retirement Scheme of 1988 is being accounted for as and when it falls due under the Scheme. The liability under the Scheme as on March 31, 1995 as actuarially determined is Rs. 6,139,000.
4. Investments include:
   a) Bonds valued at Rs. 67.67 million (face value Rs. 71.35 million) which were misplaced in transit. Necessary action in terms of lodging FIRs with the Police and notifying the issuers of the bonds has been taken. The Bank continues to hold valid legal title to the bonds as their registered owner.

BANK OF AMERICA NATIONAL TRUST & SAVINGS ASSOCIATION (INDIAN BRANCHES)

b) Bonds valued at Rs 182 72 million (face value Rs 220 million) currently registered in the name of a third party which has been notified under Section 3(1) of the Special Court (Trial of Offences Relating to Transactions in Securities) Act, 1992

Claims aggregating to Rs 801.45 million have been made on the Bank by another Bank on account of securities that were allegedly not delivered The Bank has disputed these claims and has been legally advised that they are not tenable
The Custodian/Notified Person under the Special Court (Trial of Offences Relating to Transactions in Securities) Act, 1992 have made claims for delivery of Units/Bonds aggregating to Rs 710 million (face value) alongwith consequential gains thereon The Bank has disputed the claims and has been legally advised that they are not tenable
Previous year figures have been regrouped and reclassified wherever necessary

As per our report of even date

AUDITORS' REPORT

We have audited the attached Balance Sheet of Indian branches of Bank of America NT and SA as on March 31, 1995 and also the Profit and Loss Account of the Indian branches of the Bank for the year ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Sub Sections (1), (2) and (5) of Section 211 and Sub Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956 The accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949

We report that

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit, and have found them to be satisfactory
(b) The transactions which have come to our notice have been in our opinion within the powers of the Bank
(c) In our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books
(d) The Balance Sheet and Profit and Loss Account of the Indian branches of the Bank dealt with by this report are in agreement with the books of account.
(e) Reference is invited to Notes in Schedule 17 regarding investments (Note 4), claims made by other banks on account of securities allegedly not delivered (Note 5), and claims made by Custodian/Notified Person under Special Court (Trial of Offences relating to Transactions in Securities) Act 1992 (Note 6)

Subject to the above, in our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with other notes thereon give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as on March 31, 1995 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches for the year ended on that date

Dismantling Men

Crisis of Male Identity in 'Father, Son and Holy War'

Rustom Bharucha

Besides situating the theme of hegemonic masculinity within the specific political atmosphere and organisation of the Hindu right in contemporary India Anand Patwardhan's film moves out in different directions to illuminate the crisis of male identity in society at large

WITHIN the patriarchal determinisms of contemporary cultural practice in India it is rare to encounter a film like Anand Patwardhan's Father Son and Holy War' that compels one to confront the dubious privilege of being a 'man in Indian society What began as a documentary on the Hindu Right and its legacy of communal and fundamentalist violence became in Patwardhan's words, reflection on the crisis in male identity' To what extent the film succeeds in dismantling its own implications in this crisis is subject to discussion at many levels What cannot be denied, however is that it does offer a very strong exposure of patriarchy, and the beginnings of a critique against masculinity, perhaps the first of its kind in Indian cinema Indeed if one agrees with the general validity of the statement "Most men do not know they have a gender They can afford to take their sex for granted It is the norm [Middleton 1992 11] 'Father, Son, and Holy War (FSHW), I would imagine has the potential to shatter such complacency particularly among its male spectators Speaking for myself, I would acknowledge that the film does provoke reflexivity (even though it is not reflexive itself) by representing diverse ways in which masculinity has been shaped and is in the process of being constructed through patriarchal structures in contemporary India Though Patwardhan maintains a discreet silence on alternative masculinities (and male sexualities), his film nonetheless suggests, through the sheer debasement of patriarchy that it represents so relentlessly the necessity of envisioning other ways of being a man

The emphasis of my discussion is on 'masculinity' rather than 'patriarchy though it is obvious that the terms are deeply embedded in each other's discourse though their inflections are different It would be one thing to say that FSHW is against patriarchy – that would indeed, be a loaded truism given the predominance in Patwardhan's film of the systems values and beliefs created and regulated by men, for the benefit of men But to read a critique against masculinity in the film, as I choose to, is a more contradictory and provocative proposition, not least because this critique is subsumed – almost secreted – in the large representation of patriarchy

There is also the problem of prioritising terms within the existing categories of secular discourse Most Indian men in professional disciplines even those involved in feminist bashing at covert levels, would have no problems with articulating positions against patriarchy At an academic level patriarchy has become very respectable But these very men would possibly find it a little more difficult if not embarrassing to acknowledge that they are against masculinity, because the unavoidable inference in such a position would suggest an undermining of their manhood itself

Man masculinity manhood the terms are not that clear Do you become a man or are you born one? Are men necessarily masculine ? Indeed, some men may reject their masculinity on ideological and/or sexual grounds And yet there are so many false assumptions here insofar as it is often assumed that homosexuals, for example are not men' they are feminine Yet gay and homosexual cultures, however unofficial, are often marked by strong masculine codes So, does masculinity in this case become a style', a representation a role , a manner of projecting manhood? The question is deeply ambiguous At this point in time particularly in India where the relationship of male sexuality to gender is almost totally silenced (or perhaps not considered to be an issue worth discussing) – we have no choice but to accept, "The relationship of masculinity to other nouns like male man manhood, manliness and virility is far from obvious ' We can begin perhaps by regarding the essentialised category of purusatva' as applying to Indian men in general with deep suspicion

If masculinity needs to be defined, however provisionally, it would be necessary not to accept it as a 'given , a natural' attribute of men, but to see it from multiple perspectives as a social and political construction that develops in specific ways at particular points in time through patriarchal interventions Though it expresses itself through particular body-behaviour, it is not intrinsically or unconditionally a biological phenomenon Nor is it a 'fixed entity , even though it is often projected through rigid, identifiable signs Here, too, one must be prepared to accept more 'fluidity' in what would seem like an unquestionably 'hard' phenomenon

There is, as R W Connell rightly emphasises, no 'one primary determinant' for masculinity no first cause like 'original sin (though the separation of the male child from the mother is often regarded by psychoanalysts as providing the condition for a nascent masculinity shaped by the codes of an external, authoritarian, non-maternal world ruled by men) [Middleton 1992 153] ' Instead of seeking such 'causes' for a master narrative on masculinity, it would be more accurate to acknowledge a plurality of masculinities shaped by different hisotrical processes and institutions And yet interestingly, even Connell who advocates such a perspective, feels the need to inscribe the 'hierarchy' of masculinities within a hegemonic masculinity This would suggest that for all the differentiations in masculinity, there are at certain points in time – not just in the process of a man s life but at particular junctures in history – consolidations of power that produce a construction of 'what it means to be a man in very specific ways, which is then propagandised at mass levels through popular consent

It is this 'hegemonic masculinity' that is, to a large extent, the subject of FSHW within the specific political atmosphere and organisation of the Hindu Right in contemporary India, particularly in the aftermath of December 6, 1992 While the narrative of the film is contextualised within this time-frame, including certain events preceding, yet foreshadowing the crisis in Ayodhya, the discourse of FSHW concentrates on the patriarchal rhetoric of communalism and fundamentalism, while dispersing in different directions to illuminate the 'crisis of male identity', which (understandably) the film does not attempt to resolve

'Them' and 'Us'

Structured in two one-hour segments, ironically entitled 'Agnipariksha' and 'Hero Pharmacy', Patwardhan's documentary negotiates a wide range of locations and contexts, ranging from the developments following Roop Kanwar's murder at the sati

site of Deorala, Rajasthan in 1987; communal tensions in Ahmedabad, Gujarat, also in 1987, the International Puthrakameshti Yagna (the ritual for the birth of sons) in Cochin, Kerala, 1992; the aftermath of the Babri masjid crisis leading to the devastation of the Bombay riots in 1993. Indeed, the film opens with the burning embers of these riots, accompanied by the voices of men – disembodied, desultory, casually inhuman – which are punctuated with sharp demarcations of 'them' and 'us'. The terror of these dichotomies lies in their shifting uses which merely reinforce the same deadly scenario of 'othering'.

On the one hand, there is self-reassurance as a voice reveals, 'there is fear only for the Muslims' (by implications, 'we're not afraid, there's no threat to us'). In the mode of retaliation, another voice glibly asserts, 'They do it, we do it too'. In a more sinister mode, there is an admission: 'A list was prepared. They knew the names' ('They'? Unnamed leaders in complicity with the arsonists). Through all the terror, there is an almost perverse attention to detail – the 'low-caste' Hindus did the looting, while members of 'high society bought the loot. Patwardhan's camera focuses on what was not looted – burned-out bales of cloth lying in front of emptied shops owned by Muslims. The deliberate violence is undercut through the men's nonchalance. 'Remember Jagjit Singh's song – If people are afraid, why go out of the house?' Another man puts it more bluntly: 'How do I feel? I'am having fun'.

'Maja ata hain'. Patwardhan compels one to listen to what is normally sanitised or deleted as irrelevant in academic discourses on communal violence. The dehumanisation of the men is heightened through one of the most terrifying shots in the entire film (for which, I believe, Patwardhan had to fight with the Censor Board in order to justify its selection and duration): an almost surreal sight of a charred corpse lying on the street, hardened through rigor mortis, one leg streched upwards, the body corroding like a piece of metal, past which pedestrians walk, as if it were a piece of garbage. The sheer horror of the image lies not in its grotesque physicality, but in Patwardhan's ability to make us confront the banalisation of violence. His non-voyeuristic use of the camera, in this respect, is exemplary.

Apart from the opening sequence, the entire narrative of FSHW can be read around the polarities of 'them' and 'us'. It is not sufficient in this regard for the enemy to be branded within the construction of a single 'other'. That 'other' needs to be linked to several 'others'. Note, for example, the progression of the following statements, which are made spontaneously by members in a belligerent crowd: 'Let Rao and V P Singh become Muslims'; 'Let Rao wear a sari'; 'Wearing saris is a sin ('paap')'. To begin with, the [illegible] are on the 'other' side as 'secular' politicians. But it is not enough for them to be branded as secular. They also have to be 'Muslims'. Even that is not enough, so out comes the insult from a sullen teenager. 'Let him wear a sari' (and thereby, by implication, become either a woman or a 'hijra'). One way or the other, this sign of femininity is a paap. The insults can go no further.

'Woman' is consistently marked as the source of 'vice' and 'threat' in communal discourse. In the Deorala site, for instance, we encounter Rajput male resistance to the proponents of secularism: 'They are strongly against us to destroy our culture'. This critique of secular men, however, is merely a pretext to include 'their wives' – lascivious women activists who need a 'male companion for their morning walk', with at least two more companions for lunch and bedtime respectively. Having indulged in this fantasy, the voice then conveniently equates 'them' with an inscrutable 'foreign hand', which is predictably involved in the destruction of 'our' 'sanskriti'.

At times, the patriarchal biases against women in communal rhetoric can be disguised through seeming approbation. As Shambhu Maharaj, the extremist Hindu leader from Gujarat, endorses the Shiv Sena in a rally, there is at one level, a dissolving of differences between 'them' (the Marathis) and 'us' (the Gujaratis). But in the process, he reinforces the 'Muslim menace' that brings the two communities together. Shifting his focus to the women in the rally, he rhetoricises the problem by reaffirming one of the most deep-seated prejudices against Muslims: their alleged hyper-fertility. 'Their population is growing', Shambhu Maharaj warns the women, 'while ours is shrinking'. Blessing the women to have eight sons, who in turn will have eight more sons, he envisions a 'creeper-like' growth of the entire 'dynasty', contributing to the strength of the 'Hindu nation'. The bottom line of his communal spiel is specifically woman-targeted: 'I request you not to practise birth-control'.

What Patwardhan succeeds in revealing through such rhetorical outbursts is a certain quality of 'slippage', whereby patriarchal, anti-woman biases emerge at the most unexpected junctures in the most unlikely places. We could be listening, for instance, to a pudgy MBA holding forth on the validity of the Puthrakameshti Yagna, as he assures us that it is 'not just sons' that the ritual guarantees, but 'progeny of a very, very high quality'. Quite unexpectedly, and with tacit support from his wife, he launches into a totally unnecessary, yet bland, 'liberal', Hindutva critique of the Muslims as a privileged, minority community (and not just the men, but their unshibited wives as well).

From where is this prejudice emanating? It is to Patwardhan's credit that he never 'fixes' the cause of the communal problem by blaming 'the Hindus' alone for it. On the contrary, he makes us confront the other side by interviewing a Muslim leader in Ahmedabad, who for all his apparent anti-communal zeal, is derisive of the notion of equality for women. Falling back on the crudest biological argument, he asserts: 'They're not match for us in physical strength'. Immediately after this interview, we hear a Muslim woman in a meeting organised by the Lawyer's Collective stating the problem bluntly. 'The men use Islam to put us down'. The 'us' here has shifted from 'Muslim' to 'Muslim women' to 'women', a new grouping of solidarity which has emerged through oppression. Through all these juxtapositions – Hindu/Muslim, fertility/infertility, strength/weakness, equality/inequality – Patwardhan sets us thinking about the problems underlying communalism, where in the final analysis, it is the deep-seated legitimisation of violence against women by men, regardless of community or party affiliation, which lies at the root of 'holy wars'.

When women are not specifically invoked in the categorisation of 'them' and 'us', the metaphor that dominates the political discourse in the film concerns the potency of men. It is first introduced by a fanatical VHP religious leader who rails against the secular mechanisms of the Indian parliament. 'They wanted to make us impotent'. Later in the film, he refers to the politicians as hijras, thereby reversing the threat of impotency into an abuse. Extending his phallocentric discourse in an even more strident register, his colleague, Sadhvi Rithambara, titillates the predominantly male audience by playing on the patriarchal norms of 'izzat' and revenge: Targeting Mulayam Singh Yadav, she rails: 'Why do you need arms? To kill a eunuch, why waste a bullet? We're Hindu, India is ours'. It is through such rhetoric that 'impotent secularism' is set against 'potent Hinduism'.

More emphatically, in one of the most provocative cuts in the entire film, an aphrodisiac seller's sales-pitch rhapsodising the semen 'shooting like an arrow from a bow' is juxtaposed with the icon of the arrow glistening in the night sky of a Shiv Sena rally. Such is the shock of the visual that there is no need to spell out the incredible layering of sexuality, potency, and militancy in the construction of masculinity. What would seem like a throughly harmless, through obscene 'male' image, the residue of indigenous sexual folklore claiming allegiance to Hanuman, provides the counterpoint to a modernist, masculinist, fiercely Hindu communal ethos.

In contrast, there are secular contexts in FSHW where the rhetoric of 'them' and 'us' is circumvented through reflexivity. The first significant use of 'we' in the film that

is not affirmative while being derisive of 'the enemy', is voiced by Swami Agnivesh, who has the courage to implicate himself and his community within the larger construction of Hindu male supremacy. 'We are guilty', he acknowledges to a rural audience in Rajasthan, while reminding them of the sanctification of the birth of the male child, and the breaking of pots that resound when a girl child is born. Problematising Tulsidas in the most down-to-earth of colloquial idioms, he reminds his listeners that while it may not be possible to delete passages from the *Ramayana* like 'Drums, untouchables, animals, and women are fit for beating', we can ensure that 'they are no longer part of our faith'. This critically empathetic reading of the *Ramayana* (as opposed to the blatantly patriarchal opportunism of Ramanand Sagar, for whom the 'agnipariksha' became a sensational gimmick on television) opens up the question of responsibility in interpreting 'tradition'.

At another level of secular intervention towards the end of the film, we listen to a stirring speech made by a woman activist on a street who exhorts people to 'remember their neighbours' during communal riots. Her discourse cuts across the specificities of religion – indeed, it transcends the issue of religion – by calling attention to the larger context of human rights and civil initiatives, which should bind us together as citizens regardless of our differences. And yet, even in this deeply felt position, there is an unconscious reiteration of 'them' and 'us'. 'If the lower castes, Muslims, aboriginal people, the oppressed were all united, we could outnumber them'. This is not the answer, to my mind, in combating communalism. The issue is not 'number', but the possibility of reaching out to diverse sections of society (including the non-communal upper castes and Hindus), without legitimising new exclusivities and intolerances in building sectors of resistance against communalism.

Icons of Masculinity

Even within the strictures of 'them' and 'us' FSHW presents a dispersed field of colliding contexts and discourses, some of which get linked and intersected, while others function more or less autonomously, in their own space and time. There are at least two ways of viewing this dispersal of materials. At a theoretical level, Patwardhan's film would seem to reflect what Peter Middleton has interrogated in his theory of masculinity.

> Is it a discourse, a power structure, a psychic entity, a history, an ideology, an identity, a behaviour, a value system, an aesthetic? Or is it all these and also their mutual separation, the magnetic force of repulsion which keeps them apart? . .Masculinity is a centrifugal dispersal of what are maintained as discrete fields of psychic and social structure [Middleton 1992.152].

At a more grass roots political level, however, which is the context in which Patwardhan makes his films and desires them to be viewed, the dispersal of materials and contexts in FSHW does prove to be problematic insofar as the links between the contexts are sometimes either too readily assumed or diffused through an insufficiently worked out argument in the language of cinema.

By far the most riveting section in the entire film (which I would like to examine in some detail) is an extended sequence from 'Hero Pharmacy', narrativising icons of masculinity. These are at once 'dispersed', yet driven by an inner momentum and energy, not evident in the rest of the film. Here one encounters cinematic risks and provocations that challenge the norms of 'political correctness' that generally tend to inhibit Patwardhan's cinematography. Definitely, this is a sequence in which the film-maker's own masculinity is placed on trial, as the narrative reveals the most blatant sexism and repressed sexuality underlying the rhetoric of 'man talk' ('mardon wali baat'). Though Patwardhan does not acknowledge the construction of his own gender and sexuality in the process of interviewing the men in this sequence, what can be read through the masquerade of masculinities on display is a deeply entrenched malaise, which could account partially for the perversities that characterise communal and fundamentalist violence.

The context of the sequence is largely determined by the celebration of Shivaji's birth in Maharashtra. It begins fervently enough with a picture of Shivaji cutting his finger over a 'lingam' to ensure the sanctity of India as a Hindu nation. The very next image, however, comes as a jolt insofar as it focuses on a mobile statue of the actress Mandakini from Raj Kapoor's *Ram Teri Ganga Maili*, who is seen pouring water over her scantily-clad body with a 'lota'. The same gesture is repeated relentlessly in a mechanised pornographic continuum, producing a form of violent titillation – more specifically, a violence inflicted on the body of woman, through a simulacrum of the actress Mandakini, who was herself 'created' by that master of sexual objectification, Raj Kapoor. It is unfortunate that the 'origins' of the Mandakini image are not opened by Patwardhan, because he would have been compelled in that case to provide a critique not only of the Shiv Sena (in whose celebrations of Shivaji, Mandakini is being deified), but of the coercive role of cinema in producing icons that have the potential to be appropriated by communal, anti-woman organisations.

What is Mandakini doing in a celebration of Shivaji? The question is anticipated by one of the ardent male supporters in the crowd, who in his attempt to answer it goes through the most circuitous rhetoric to reveal an intensely embarrassed sexual repression, covered up with male bravado. This is the kind of verbal evidence that reveals what it does not articulate. But from the convoluted rhetoric of the man, one learns that Mandakini is there to somehow retrieve a code of honour that was abused when Shivaji's 'chachi' was abducted by the Muslims, while she was bathing in the river Godavari. This happened before Shivaji's birth, but as the man emphasises, even today, 'our wives and daughters' cannot be spared the lascivious attention of the ubiquitous enemy. At this critical point in the narrative, when one is awaiting some kind of link between history and the icon of Mandakini, the man shifts gears and makes a joke as to how the goddess Bhavani will need to provide her male followers with more than a 'talwar'. In the tradition of weapons unearthed recently during the Bombay riots, she will have to arm the men with AK-56 rifles.

The seeming triviality of this 'man talk' nonetheless reveals the almost unconscious nexus of a mythic notion of honour, the lure of modern weaponry, and the targeting of a woman's body as the imagined site of protection and unacknowledged gratification of male heterosexual desire. How the need to commemorate the besmirched honour of Shivaji's 'chachi' gets translated into the visual icon of Mandakini, is left inarticulate, precisely because of the sexual filter that the men vicariously enjoy, yet are unable to confront.

From Mandakini, the camera surveys other statues of 'a brahmin god', for instance, who mechanically doles out spoonfuls of holy water to the crowds while a sequinned mirror ball glitters in the background, the kind of decoration one associates with bars and nightclubs, the underground sites of masculinity. Following this blend of glitz and religiosity, one encounters a grisly mobile statue of Narasimha, tearing out the entrails of his victim, where once again we are confronted with the same gesture, repeated over and over again, sadistically, mono-manically, in a relentless continuum of gut-tearing.

What Patwardhan succeeds in illuminating in the next sequence, depicting an amateur body-building competition (also part of the Shivaji celebration), is an almost uncanny gestural continuity between the mobile statues represented earlier and the bodies of men. It is one of the sharpest illuminations I have ever seen of the *containment* that characterises the representation of masculinity in body-building competitions. Much has been written on the element of 'strain' in representing the accentuation of

muscle in such 'displays' of the body, with the concomitant image of bodies 'ill at ease with themselves' [Middleton 1992 32, Dyer 1992] The grimaces, postures and fixed grins of the amateur body-builders in FSHW, acquire an almost parodic dimension, insofar as it becomes very obvious that their bodies are not 'built' to conform to the international criteria of judging bodies as upheld in the competition What is chilling however about the self exhibition of the bodies is their repressive mould wherein a single posture or gesture is set up and then sustained or repeated mechanically with the body pivoting on a single axis like a frozen mobile

Within the visual congruence of 'body building and mobile statues there is a shared narrative of sexual repression that gets sublimated through the virtues of preserving semen Patwardhan uses the voice overs of the body builders to counterpoint their images where through dead pan deliveries the men reveal their differentiation from other men who are slaves of the flesh in allowing their life force essence semen to fall What is implicitly upheld in such defences of healthy masculinity is the mythology of 'virya being transmitted upwards through the spinal chord in the brain in its subtle form known as ojas [Kakar 1990 119] The illusions of brahmacharya are unconsciously perpetrated in this framework where ironically the models of masculinity are not native or traditional but embodied in internationally recognised hulks like Arnold Schwarzenegger and Sylvester Stallone It is worth reflecting therefore that in addition to the colonial residue of masculinity emblematised in khaki shorts (the dominant sign of the RSS) the more contemporary icons of he men endorsed by the Hindu Right are cast within the tradition of *Rambo* and the *Terminator*, whose fascist constructions have already entered the traditional figure of Sri Rama among other icons

Tuning closely into the subtext of what is being said (and suppressed), Patwardhan concretises the sexual undercurrents of the men's voices through a series of blatantly macho images, beginning with the Indian Rambo, Sunny Deol (of whom it is said, 'jaan hai, build hai'), lurid posters of *Aag hi Aag*, *Julia* ('an obsessive story of violent love'), *Bombay Blast* ('the most violent film against violence') Through the onslaught of these images, in which the violence of machismo is highlighted, we hear anonymous men's voices, once again wallowing in the most debased kind of 'man talk' 'When we see rape in cinema, it is fun, but in real life with partnership, it could be different (so long as we don't know the girl)' The English word 'partnership' punctuates the Hindi with an almost predatory resonance, evoking the male bonding that underlies the increasing violence of gang-rape in India, which gets legitimised through collective male complicity (with 'partnership', or otherwise) Culminating the ghastly narrative voiced by the unseen men is the subterfuge of masturbation which becomes a substitute of violence rather than a means of countering sexual repression In the cinema (during the hot scenes) one feels like climbing on the screen your hand gets to work In this man talk replete with matter-of-fact obscenity, we come closest in the entire film to a representation of men acknowledging their sexuality without being able to confront it

From this juncture in the film Patwardhan makes yet another inspired cut into a seemingly different context of masculinity determined by wrestling matches on satellite television In a conceptual leap of considerable political significance the narrative shifts from local contexts of violence inspired by international models of masculinity to global representations of violence feeding the male fantasies of the third world From shots of pistols rifles toys the figure of He man the sequence focuses on the WWF wrestling star Hit man whose violent and obviously rigged fight on television is being watched avidly by a group of spectators – boys in the process of becoming men What makes these images of wrestling so culturally aberrant is not merely their distance from the local traditions of kushti but their fabrication of a hyper masculine aggressive behaviour whose idiom can be most accurately ground in the comic book masculinity of figures like Superman and Batman (but with far less IQ than these prototypes) What is being celebrated through wrestling on television is an essentially dumb inarticulate oafish idiotic masculinity A post-modern response to these figures would advocate irony in our perception of their performance but in the absence of adequately contextualised transcultural codes of seeing these wrestling stars become models of masculinity to millions of spectators, particularly boys from 'other cultures

With devastating matter of factness, Patwardhan makes us see the consolidation of patriarchy at this early stage in the fantasies of boys In the absence of parents and sisters they assert their nascent manhood with discomforting clarity 'Only boys wrestle', 'boys are heroes', 'we don t play with girls because they wear saris (a disturbing echo of the earlier comment in the film when Narasimha Rao is advised to wear a sari) Most sullen of all comments comes from a boy, who says, 'We don't play with girls, because girls are girls and boys are boys' This is not a cute statement, but an extremely calculated opinion in which the polarities of patriarchy are set. As we see these boys pummel and hit each other, in a total absence of camaraderie, we are compelled to question whether they are enacting their inner fantasies or merely displaying their already existing knowledge of 'a world where adults kill one another' [Middleton 1992 91 92]

To what extent is the class determination of the boys depicted in FSHW a criterion in assessing violence? Patwardhan provides some rare footage of Macho Man's visit to Bombay where he is practically mobbed by rich kids in a promotion campaign sponsored by Kwality ice-cream In the next sequence of the film, we see young boys of the Shiv Sena demonstrating a different kind of rowdy behaviour on the street Though the young blood' of Bal Thackeray may have no direct access to the consumerist benefits of Macho Man s followers they are nonetheless part of the same process of globalisation, whose power lies in the fact that it can market icons (and derivations) of Macho Man (and his kin) in the most diverse ways and in the most unlikely quarters In addition to these globalising mechanisms however, the traditional and indigenous norms of being a man in India are affirmed at almost every level of social interaction from the aphrodisiac seller s promotion of virility on the street to the education of a male child at home to his eventual consolidation of patriarchy through marriage Heterosexist supremacist, and hierarchical, these norms of 'being a man in India can get reinforced through international images of virility What is perhaps, less evident are the levels of confusion inadequacy, and impotence among men, which seem to be increasing in almost direct proportion to their declining self image in an increasingly competitive world dominated by masculine icons which are at once, alluring yet unrealisable

Men s Silences

If Patwardhan does not reveal the inner crises of masculinity in India this can be directly related to the fact that it is very rare for men to acknowledge these states of a bankruptcy The failure of being a man deepens through the self imposed limits of male expressivity Men prefer to be silent about their vulnerabilities In the absence of social and political movements in India like 'men against sexism , which have themselves proved to be infuriatingly 'pietistic' and self-agonising despite (or perhaps, because of) their imagined feminist orientations,[4] men in India – cutting across, class, community and ideology – have yet to dismantle the constructions of their own gender and sexuality And in this regard, Patwardhan is no exception

What we see in his film are the manifestations of patriarchal violence, the bravado and rhetoric of men, but they remain externalities which are recorded and inserted in a secular critique of communalism with no reflexivity whatsoever on the perceiving subject By failing to acknowledge its own complicity in its critique of other men, FSHW becomes, at one level, like most representations of masculinity by men, a 'face-saving exercise' [Middleton 1992 7] One is not advocating here that 'the gesture of reflexivity' should itself be made 'the subject of preliminary inquiry' An excessive focus on reflexivity can become an indulgence especially when representing a crisis as politically diverse and complex as communalism, but a reflexive dimension in the critical inquiry of any political phenomenon can only deepen, to my mind, the perception of other people's behaviour and relationships within the construction of one's own identity Apart from confronting the particularities of its own subjectivity, a secular discourse should not be de-sexualised or assumed to transcend the limitations of gender

It is in this context that there are inner worlds to be probed, to my mind, in the seemingly devoted silence of a young Shiv Sainik listening to Bal Thackeray with reverence or a man masturbating mentally on the figure of Mandakini while endorsing male honour – inner worlds that would undeniably complicate fixed notions and identifications of male gender, sexuality, and politics To represent men talking' and not just indulging in 'man talk', one would need to catch them off-guard and not just through anonymous subterfuge (How Patwardhan actually gets men to 'talk', without acknowledging their identities or his own, would definitely be a film worth reflecting on But first, it would have to be made) Whenever Patwardhan shows men, it is invariably *en masse* in public forums, the more intimate encounters in tea shops, bus stops, bars, 'akhadas' are not part of the landscape of his interviews Not once do we see these men with their own women – mothers, wives, daughters - in their own homes

Apart from placing men in more private, less confrontationist contexts, it would be useful, I believe, to see the male votaries of the Hindu Rights in situations of vulnerability This might seem like an overly idealised gesture of compassion on my part, but what concerns me is the strengthening of one's critique of communalism through the incorporation of its fissures and uncertainties It would seem expedient in this regard not to essentialise the masculinity of the Hindu Right, but to see its configurations in relation to different pressures, tensions, capitulations, threats, to which men respond differently, despite the larger hegemonic thrust of the movement. Essentialising 'communalists' is the surest way of playing into a scenario marked by 'the enemy' What is needed is a more complex analysis as to why and how particular states of insecurity among men get transformed into hatred of an entire community or religious group

Underlying the male aggression of the Shiv Sena, for instance, as Gerard Heuze has analysed in depth, are the realities, frustrations, and humiliations of unemployment, which get manipulated through different languages of aspiration, struggle, power, and liquidation of 'the enemy' [Heuze 1992] Despite the unquestionable vileness of this construction of 'the enemy', there is also a depth of unacknowledged impotency among the Shiv Sainiks, which Heuze unearths in one of his many telling interviews 'They see themselves being "hacked up, smashed to bits, flattened, crushed, shattered, torn open, cast on the rubbish heap, eaten away, having the blood sucked out They speak of "being winded", of a "lost life of forbidden possibilities, obstructed ways, frustrations and of a lassitude without a name"'

If these vulnerabilities (cast in the language of violence) are not echoed in any way in Patwardhan s film, where the upholders of Hindu Rights are almost consistently malevolent, this needs to be viewed as a conscious silencing of the vulnerabilities underlying the construction of communal identity which is part of the larger strategy underlying the construction of 'man' in Hindutva Men's silences, I would argue, cut across party community, and religion even though they are repressed in different ways for different reasons [Rutherford 1992] While Patwardhan makes an issue out of the fact that Hindu communal men are not essentially different from their Muslim counterparts, he implicitly differentiates secular men' from 'communal men', without confronting the differences between secular men And here, one does encounter the central tension underlying his representation of a 'crisis in male identity', insofar as he is prepared to acknowledge it without implicating himself (or his secular brethren) in it

Redefining the Human

The non-reflexive limitations of Patwardhan's perspective of 'men' is evident in his mode of film-making, which is driven by political necessities rather than shaped through processes of introspection Facticity is his priority, not the sharing of an experience While facing an almost unbearable amount of suffering, Patwardhan's camera – frontal, direct, immobile – remains seemingly untouched by pain. In his scrupulous rejection of any admission of vulnerability or doubt on his part, one can only assume that Patwardhan is fully "in control' not only of his subject matter, but of his feelings as well. Like a real 'man', he controls the chaos around him through the shaping of an argument, while remaining consistently civil in allowing both the victims and the perpetrators of violence to explain their point of view, ensuring their provisional trust through the code of anonymity Through all his attempts to dismantle masculine myths and delusions in the film, Patwardhan's male identity remains intact

In this context, he fails to explore other ways of being a 'man', mediated, for example, through constructions of 'femininity' FSHW could have been enriched, to my mind, conceptually and politically, if it could have incorporated Mahatma Gandhi's radical reversal of 'the colonial culture's ordering of sexual identities, by which manliness ('purusatva') is superior to womanliness ('naritva') which in turn is superior to femininity in man ('klibatva') [Nandy 1988 7-8, 52-53] As Ashis Nandy has pointed out, Gandhi has at least two countermodels one, in which 'manliness and womanliness are equal, but the ability to transcend the man-woman dichotomy is superior to both', and another, in which, femininity is superior to masculinity, which, in turn is better than 'failure of masculinity' ('kapurusatva') While Nandy's categories are essentialised, operating at the level of principles rather than historical difference, they offer a grid for possible contentions and speculations on alternative masculinities, which Patwardhan does not address Instead of entering the profound ambivalence of concepts like 'ardhanarishwara', or the traces of femininity that are to be found in the 'irreducible tendency towards bisexuality' in men,[3] Patwardhan settles for a less gender-specific alternative in positing the 'human' as a site for re-building civil society

The 'human' is the constant counterpoint in FSHW to the violent constructions of masculinity At times, it is merely glimpsed through ordinary sights, such as a girl looking out of a balcony, smiling and laughing as she watches a secular procession on her street In a slum, we see the backs of two children going to school, connoting a strangely tender image of the routine of everyday life which continues through the violence. Amidst the debris of communal devastation, a cat washes its face nonchalantly: Patwardhan tends to gloss over these details, almost as if he were embarrassed to enter their nuances. He is more at home with cryptic, matter-of-fact images, such as an OM sticker on a policeman's vehicle, or a communal

activist smoking a cigarette on a 'ratha', or more chillingly, a computerised sign – *HAPPY JOURNEY* – which continues to gleam automatically, in an overcrowded railway station, where everything has fallen apart, not least the lives of people destroyed through riots and arbitrary violence.

It is in recording histories of pain that Patwardhan reveals his deepest commitments. In a slum destroyed in a Shiv Sena pogrom, we hear the voice of a woman questioning the legitimacy of violence with an almost excruciating simplicity: 'What wrong have we done? What crimes are we being punished for? We haven't lived here for just a day, but for 40 years. Where are we to go?' Without making an issue of it, Patwardhan follows this agonised voice with a very unobtrusive shot of Muslim men praying in an alley. The image does not attempt to make an overly didactic statement; it is simply reminding us of the critical truth that when people lose everything in life, they inevitably fall back on prayer. It may not be a solution, but it provides a temporary respite from the violence and uncertainties of everyday life.

It is to Patwardhan's credit that he is increasingly open to the enigmas of faith, including the fundamentalist variety. In this respect, he makes a genuine attempt to probe not just the mechanisms of intolerance, but the 'faith' animating the perception of such mechanisms, by which they get transfigured as divine signs in the world of believers. Such is the case with the cook Godavari whose interview in the film reveals an almost fanatical state of grace, which is also intensely human. Not only does she believe that God's rays burned Roop Kanwar, she actually sees photorgraphic evidence of this divine intervention, denying the obvious reality that the two photographs have been pasted together to create the fiction of a 'miracle'.

'How can God be photographed?' the interviewer asks her. To which she responds, with an almost trance-like serenity: 'Gods can be photographed. They live in trees. See the God in the photo and see the burning pyre... If you could not see God, how could you believe that she was burned by God's rays?' The concrete literalism of this defence is what marks fundamentalist discourse in other contexts as well, and yet, as 'believed' by Godavari, it is extremely difficult to condemn it outright. Shaped as her belief is by the patriarchal construction of the 'pativrata' (for whom a husband is God, even if he beats her), can we deny Godavari a 'quasi-autonomous' subjectivity that animates her inner world? Or is this subjectivity a patriarchal construction in its own right?[6] In what state of illusion is Godavari living, one could ask, when it is equally possible for another working-class woman interviewed in the film to see through the economic foundations and patriarchal engineering of sati, with down-to-earth, subaltern common sense? Why is Godavari different? The question compels one to unearth the different ways in which patriarchy is rejected and/or internalised (as in the case of Godavari) in a seemingly non-negotiable, yet enigmatic subjectivity.

In juxtaposing Godavari's 'faith' with the subaltern woman's struggle for self-reliance and independence, Patwardhan uses his most developed strategy as a director in delineating the larger contradictions of a situation through opposing positions. Later in the film, he complements diverse histories of pain, by interrupting the narrative of a Muslim woman (a social worker who has been raped by the communal murderers of her husband) and that of a Hindu mill worker, whose two children get killed in the cross-fire of a riot. It is not just the juxtaposition of 'Muslim' and 'Hindu' that makes the narrative effecting. Indeed, this kind of strategy in the hands of a less sensitive director than Patwardhan could easily degenerate in a specious kind of 'democracy', where a false attempt is made at objectifying the losses and atrocities on both sides. Wisely, Patwardhan does not attempt to draw 'comprehensive' lessons from the narratives. He simply allows their subjects to speak in a context of trust, thereby revealing that vital quality which has distinguished his contribution to documentary film-making in India: the capacity to elicit and record personal testaments of oppression, injustice, and violence by ordinary citizens, struggling to retain their faith in humanity.

Such a testament is provided by one Sayed Ismail Sayed Wajid, an ordinary slum-dweller who is seen with his family and community in the closing sequence of the film, re-building the destroyed home of his Hindu neighbour. This is just one of the many evidences in the entire film of what must be affirmed as grass roots secular action. More so than in his earlier films, Patwardhan counters the increasingly widespread prejudice, particularly rampant among the supporters of 'indigenism' and 'nativism' in intellectual circles, that secularism continues to be a 'western', foreign, conceptually bankrupt importation in India. In FSHW, the secular activists may not be using the official discourse of 'dharmanirapeksata', but through their gestures, choice, resistance, and coalitions, they are actively preparing the grounds for an emergent secularism in India, rooted in the realities of everyday life.

On a personal note, I was struck repeatedly throughout the film by the expressivity of the secular workers, not so much in their street performances or processions, but in the exchanges of solidarity so evident, for example, among the women of the Lawyer's Collective social action group. Just the simple action of sharing of a glass of water or singing together, while dwelling on their life-experiences, provided deep glimpses into the emotional substratum of the women's movement in India. One wishes here that Patwardhan would linger on these inner states of emotion with a more fluid sense of duration. A secular politics can only be strengthened rather than diffused through the incorporation of seemingly ordinary exchanges and sentiments in everyday life.

Such is the subtlety, however repressed, of the representations of women's interactions, that it becomes almost redundant for Patwardhan to end the film with the icon of a mother-goddess, who has been viewed earlier in the film as a nurturing, non-violent, non-hierarchical figure, preceding the ascendancy of the phallus and the emergence of patriarchy. In the absence of an experiential context in relation to this figure, however, the icon merely rotates in a void, perhaps resonant to those feminists familiar with her context, but somewhat abstracted and unreal to viewers at large. It would have been more appropriate, to my mind, if the film had ended on the image of water flowing in the neighbourhood where Sayed Ismail Sayed Wajid is building his neighbour's home. This is not because the sequence radiates the obvious message of 'communal harmony', but because the speaker himself exudes an altogether rare male sensitivity, which is almost overwhelming in its gentle, understated, human dignity.

If we have to seek alternatives in order to 'break the cycle of violence', we can find them in such living examples of civil initiatives among citizens. It is by reaching out to each other in a re-invented context of trust and love that humanity can be redefined. The mother-goddess in FSHW is merely a utopian point of reference, a politically correct insertion, but it is not part of a lived or imagined relationship. To 'imagine the future', as Patwardhan urges us, we need to begin not with the exhumed symbols of the past nor with the globalised icons of the present, but with emergent, human relationships, cutting across class, community, and religion. For this to materialise, however, 'men' will have to begin the struggle of dismantling their masculinities, by questioning their power in relation to the instabilities of gender and sexuality.

Notes

1 I wish to acknowledge the many insights I have received from Middleton's reflexive study of masculinity. In a spirit of

reciprocity, I trust that this essay responds to the need for different histories of masculinity 'Other men other cultures, will have other things to say to which we need to listen Our ability to hear those men will be much greater if we understand our own masculinity more clearly'(p 12)

2 For a detailed analysis of the separation of the male child from the mother in the Indian context read Kakar (1982), particularly the section entitled 'The Second Birth

3 For a brilliant analysis of Sadhvi Rithambara's persona, read Kumkum Sangari (1993) While Rithambara may not name herself as a woman but as a *sadhvi* (literally a chaste woman) her very 'self abnegation and desirelessness enable her to play with the discourse of desire and male impotency/sexuality which according to Sangari, 'sexualises both the Hindu rashtra and communal violence achieving an effect quite different from the male use of similar discourse (p 878) The question still remains whether Rithambara is not operating exclusively within a masculinist frame of rhetoric which she is merely extending rather that subverting through her neutered female presence

4 Read for example Jennifer Somerville's The Sexuality of Men and the Sociology of Gender *The Sociological Review* 37/2 pp 277 307 quoted by Peter Middleton in his critical section on 'Men's Movement Theories of Emotion and Experience' *The Inward Gaze* pp 118 30

5 For a provocative examination of both the beneficent and negative aspects of 'Ardhanarishwara the yearning for wholeness and the tensions and disequilibriums between female and male read Wendy Doniger O Flaherty (1980) O'Flaherty emphasises the primary maleness of the androgyne in Indian mythology so that 'Ardhanarishwara as she reminds us is always regarded as a form of Shiva not a form of Shiva and Parvati, the literal meaning of his name is The Lord (ishwara) who is half (ardha) a woman (nari')' (p 315)

On bisexuality read, in particular, Sudhir Kakar's deeply pertinent comments in the Indian context on the 'mergence of the boy child with his mother Kakar (1982) elaborates on the early, 'symbiotic period of human development, when the boy has yet to distinguish his body and psyche from the female body and feminine psyche of his mother, he still has to separate himself from her before he can begin the process of becoming masculine' (p 161) It is through these traces of the early merger with the mother' that an 'irreducible tendency towards the bisexual can be discerned in 'every man (p 163)

6 From the deeply researched study of Sudesh Vaid and Kumkum Sangari (1991) it would seem that 'it is not only explanations of belief in widow immolation as "sati" which are ideological *but the belief itself* (my italics) Categorically denying the 'autonomous orgin' of belief, which is inextricable from 'the social processes which generate it , the authors nonetheless qualify that 'once articulated in rituals and institutions belief acquires a relative autonomy of the sort that other ideological formations have It is this 'relative autonomy I believe that needs to be opened through the trajectories of subjectivity and desire

FORD FOUNDATION POST-DOCTORAL RESEARCH FELLOWSHIPS IN ECONOMICS

Applications are invited for overseas post-doctoral research fellowships in economics (maximum non-extendable duration of 12 months) for **the 8th round** of selection of scholars These fellowships are tenable at prominent foreign universities or economics research institutions and are intended to strengthen research and teaching capabilities in India in **Macroeconomics, International Economics, Public Economics** and provide opportunities for Indian scholars to improve their skills in these areas through course work Proposals of both empirical and theoretical research **in these and also other worthwhile areas such as environmental economics and economics of finance will be considered** Scholars who are awarded fellowships may be given, on their return home, financial assistance to follow up research which they would be taking up during the tenure of their fellowships

Indian citizens permanently employed in Indian universities, colleges or research institutions, **with a Ph.D in economics and below 40 years of age as on the last date prescribed for receipt of completed applications**, are eligible for these research fellowships Other things being equal, preference will be given to candidates teaching in a university or college However, no one who has already been abroad for professional research/training for a period of more than four months will be considered for the fellowship

Only persons holding permanent positions are eligible to apply The fellowships will be administered in India by the National Institute of Public Finance and Policy For an application form, please write to the Associate, (Admin & Fin) National Institute of Public Finance and Policy at the address below giving date of birth, field of primary specialisation in economics; present position; Ph D thesis title, name of Ph.D supervisor, thesis abstract, university and date of Ph D award, with a stamped (Rs 4.00) self-addressed envelop of size 23 cm x 10 cm.

*** LAST DATES**

For requesting for application forms	August 7, 1995
For receipt by NIPFP of completed applications	September 11, 1995

NATIONAL INSTITUTE OF PUBLIC FINANCE AND POLICY
18/2 Satsang Vihar Marg
Special Institutional Area
New Delhi-110 067.

Feminification of Theory

Veena Ravi Poonacha

CONSTRUCTIVE criticism of a political philosophy which has radically changed our understanding of social reality is welcome. But Dipankar Gupta's critic of feminist theory and its affinity to post modernism (March 25) smacks of male prejudice behind a thin veneer of sophistry. The article is smattered with stereotypes of women and men who attempt to transcend the limits of gender subjectivity. One marvels at the intellectual arrogance which dismisses an entire system of thought and a widespread movement validated by women's lived experience with only a cursory examination of a segment of its theories.

The basic flaw in his argument despite his obvious marxist leanings is his ahistorical construct of the history of women's resistance to male domination. Furthermore, failing to appreciate the differences in the various strands of feminist thought he arbitrarily subsumes them under post modernism which has never been influential beyond the academia. Feminism cannot be simplistically understood as a single theory; the range and scope of its inquiry goes beyond body politics to question the rendering of power relationship in all areas of human life.

Representative of attempts made by women to make sense of their lives, feminism cannot be construed as a finished theory but should rather as a set of open-ended questions about society. The seeming contradictions and complexities within its ideologies and political strategies which seem to confuse this writer stem from their theoretical underpinnings. The varying assumptions made about the consciousness of the gendered self as either the product of socio historical conditioning or as biologically innate informs their perception about the primary site of women's oppression. It in turn influences the conceptualisation of human nature and the relationship of the individual with society and state, creating the visible differences in feminist ideologies and agenda for action.

Feminism indubitably, as pointed out by the writer perceives sexuality and the construction of gender identity as intrinsic to consciousness. It presumes that all social relationships and responses devolve from the biological accident of one's birth to influence societal notions of individual 'entitlements' to the resources of the society. Gender identity, therefore, creates marked disparities in people's access to resources, avenues to attain social prestige and freedom to choose lifestyles.

But the centrality accorded to gender and sexuality in feminism does not preclude a concern for issues that affects the entire society. In effect feminism addresses a wide range of issues; their critique of the present socio political organisation, built on what may be termed masculist ideology of domination and aggression, from the vantage point of women is an extremely valuable counterpoint to examine the destinies of nations and the world.

The paradox of post-modernism has been fully realised within feminism. For on the one hand by acceding to the contention of cultural relativism it denies the political possibility of a universal category of 'woman' required to bring about a change in the existing gender relationship, on the other, by legitimating the cultural identities it forces women into stereotypical mould of womanhood that are culturally defined within a given society. Despite these limitations and the threat it poses to the existing disciplinary grids, which seems to worry the writer, one cannot deny the radical contribution made by post-modernism to our understanding of the nature of truth. Truth is undeniably notional, multi dimensional and relative to the power relationships in society.

Politics of Choice in Popular Policies

K Ravi Srinivas

THIS is with reference to the note on Politics of Population and Development (*EPW* September 17, 1994). There is much evidence to suggest that population control figures as a major item in the agenda of governments and international agencies. Initiatives taken prior to Rio 92 at the Rio 92 conference and elsewhere indicate that the population question is emerging as a major question. In national reports prepared for UNCED, population dynamics was listed as one of the three major problems by more than 90 per cent of developing countries with reference to planning for sustainable development. As usual they needed more funding and technical assistance to meet the increasing demands of population programmes and family planning services. Population was identified as a cross sectoral issue thanks to lobbying by UNFPA and various NGOs. The final prepcom documents on population did not include targets and timetables but called for more research on demographic trends, linkages between population and environment etc. Section 4 of Agenda 21 states with reference to earlier international population agreements that governments should "implement as a matter of urgency, measures to ensure that women and men without bias of gender have the right to decide freely and responsibly on number and spacing of their children, to have access to the information, education and means, as appropriate to enable them to exercise this right in keeping with their freedom, dignity and personally held values". The conference would have succeeded in pushing population as a major issue and would have ensured that UNCED adopts a stand that views population growth as a major issue and hence deserves more funding and commitment from governments, but interventions from feminist groups, the Holy See and the US delegation, besides opposition from G77 at various stages, ensured that this did not happen. But the battle is far from over.

Two years ago, the then minister for health M I Fotedar asserted "For us the limited family norm is not a distant theoretical idea but the very basis of our economic and social upliftment endeavour is dependent on speedy translation of concept into actual reality".[1]

In fact a committee headed by a chief minister and including a few chief ministers and a member of the Planning Commission had recommended the following: (1) People with more than two children would be excluded from PDS. (2) Introduction of disincentives for those who do not conform to the two child norm. (3) Government employees who conform to this norm would be given priority in allotment of government accommodation. (4) Debarring from promotions for five years for employees who violate the two child norm. (5) Dismissal from service on the birth of the fourth child. (6) Low interest loans for housing and vehicles should be given only to those who follow the norm. (7) Medical facilities and leave travel concessions to first two children only. (8) Those who have

violated the two child norm should be debarred from being recruited to jobs in government departments/autonomous bodies/ public sector units

Although these suggestions have not been implemented way back in 1976 the Maharashtra assembly did pass a bill providing for some incentives and disincentives similar to the above suggestions The committee has suggested that the disincentives can be withdrawn if one member of the couple undergoes sterilisation The fact that such suggestions which if implemented would violate the fundamental rights of citizens and would unduly punish children for no fault of their own were being articulated indicates that population control by coercion was acceptable to the powers that be Thus while the suggestions of the committee headed by M S Swaminathan are controversial similar suggestions have been made even earlier Yet most of the opposition parties have not publicly condemned such suggestions There seems to be a consensus that India's increasing population is a stumbling block in the development of the nation This accepted wisdom should be questioned

Of course these days much lip service is also being paid to women's literacy improvement of women's status etc in the context of women's development But the population establishment is using this rhetoric to hide the ugly face of population control and as a cover to deny the reproductive rights of women This is also being used to co opt feminists NGOs and others to further the objectives of population establishment

Similarly the word choice is used to promote solutions to the problem of overpopulation It is stated in an article published by the pharmaceutical MNC Organon Scientists around the world are convinced that finding a universally acceptable contraceptive vaccination is the key to controlling population growth in the developing world

When the motives behind the development of such contraceptive methods are so clear the population establishment wants women's groups to participate in clinical trials and evaluation projects But barrier methods are not given much importance and technocratic solutions are promoted as safe solutions and options, all in the name of participation decentralisation and widening the choice available to women

It is well known that the new economic policies are being implemented with support from the World Bank and the IMF Right from the days of Robert McNamara, the World Bank is an advocate of controlling the population explosion' and has funded projects related to population control In addition, the World Bank at times incorporates analysis of population growth and its role in economic development In some countries (e g Jordan, Turkey) the Bank succeeded in raising population as an issue in discussions with high level officials In the case of Indonesia, the bank's role was much wider Its population sector work was instrumental in helping the Indonesian government to develop its population programme In Africa the population issue figured in many of the reports prepared by the bank in 1987 88

In Senegal preparation of a Population Policy Statement and Action Plan became an agreed condition of the release of third tranche of SAL The action plan was to include explicit targets also In Nigeria the bank played a major role in policy formation and approval of policy Another important feature of the bank's work on population is the use of dialogue to persuade governments and particularly those in top positions The bank's success in policy dialogue is due largely to its access to the highest levels of government and its links with a wide range of ministries Fred Sai cites instances of changes in policies brought about due to dialogues held with presidents and heads of state The bank's senior population adviser is also involved in policy dialogues Besides this, the bank promotes dialogues through seminars, training programmes, etc But as indicated, the bank's work extends to persuading governments to accept conditions also According to Fred Sai, the "bank was instrumental in persuading Bangladesh to offer voluntary sterilisation in their family planning programmes as part of negotiations surrounding the third population project" Besides these, the bank also conducts research on population which includes *inter alia*, incentives for small family size The bank also works in collaboration with other agencies such as USAID and UNFPA India figures in the list of key countries' which are considered to have serious population problems Thus the role of the World Bank in promoting population control is obvious and since the World Bank plays a major role in deciding on further assistance to the country we need not be surprised if population stabilisation or population control becomes a conditionality in future

The possibility of the World Bank's intervention through SALs cannot be ruled out [1]

Similarly, the impact of structural adjustment programmes (SAPs) advocated by the World Bank - IMF on women's health and well being have been highlighted by women's groups and concerned scholars A report from the US could serve as a warning signal to us in India about the implications of SAPs Although the report is about the impact of Reaganomics, it is relevant as Reaganomics and SAPs have many common features Both are based on the same ideological principles and were touted as miracle cures But the miracle has brought little cheer to women It has helped the rich to become richer and in the process the US is competing with developing nations in its performance in decline of social services infant mortality etc

Reaganomics and Women Structural Adjustment US Style 1980 92 A Case Study of Women And Poverty In the US has been published by Alt WID (Alternative Women in Development) a coalition of women researchers and policy advocates based in Washington DC They focus on alternative policy directions to empower women particularly women in poverty both within the US and in so called Third World countries The report cites a study which has shown that the average rating of US social health has declined from 69 points on a scale of 100 during the Nixon Ford regime to 61 points during the Carter regime and declined further to 38 points during Reagan era This index was devised by Fordham University Institute For Innovation in Social Policy and takes into account 17 indicators such as unemployment infant mortality food stamp coverage children in poverty, etc The 1990 index focused on the social health of women looking at poverty, violence health coverage and income gap between women and men from 1974 88 Women's social health index declined from 78 points in 1974 to 38 points in 1988 Although women have borne the brunt of declining social health, the worst hit were African American women and Latinos who have higher rates of unemployment are disadvantaged in the labour market and earn lower wages than European American women About one fourth of all African-American and Latino children lived in families having incomes below the poverty line

In access to health care, the trend towards privatisation of health care delivery, increase in the number of for profit hospitals, and reduced federal funding for health care of the poor accentuated the situation This report points out that according to the National Research Council, "For people of the lowest economic status overall morality was 80 per cent greater than those at the highest socio-economic level" Although the number of poor has increased, funds for the Medicaid programme, designed to provide health care for the poor, have not increased in real terms In 1976, 65 per cent of the poor were covered by Medicaid by 1984 this number had declined to 38 per cent According to the report, 'because of discrimination women, particularly low income and minority' women suffer disproportionately in terms of access to health care'

According to Peggy Antrobus The problem with structural adjustment policies is not that they assume women are outside of development and need to be brought in (via accompanying compensatory programmes) but that they are actually grounded in gender ideology which is deeply and fundamentally exploitative of women's time/work and sexuality

Since undue attention is given to population control other issues relating to women's health do not get the attention they deserve Nor is there a positive correlation between high rates of contraceptive prevalence and reproductive health Jodi I Jacobson points out that in Brazil which is considered a family planning success story high contraceptive prevalence rates exist against a backdrop of declining reproductive health A World Bank study also pointed out that reproductive health needs are poorly met Due to lack of alternative methods women had little choice except sterilisation As a result 41 per cent of women users had undergone sterilisation [4] Policies that explicitly or implicitly promote sterilisation thus end up denying the reproductive rights of women Indonesia is often cited as a success story in family planning, particularly its achievements in involving religious leaders and the community in achieving the goals of family planning However, what have Indonesian women gained in the process and whether it is a success story for women are some of the questions that cannot be ignored Ines Smyth has critically examined this case in the light of such questions [5]

The much cited Indonesian model ensures that women's reproductive rights are effectively controlled by the state But in terms of indicators of women's health and welfare, one has to re-examine the whole notion of success in family planning Closer to home it has been pointed out that Tamil Nadu, which is considered a success story in family planning, cannot be considered so in terms of indicators of women's health Sundari Ravindran points out "At the same time perinatal mortality rates and stillbirth rates, indicators of women's health during childbearing years, showed an increasing trend and remained above national averages" [6]

Blindly encouraging schemes to offer incentives for those practising the two child norm and disincentives and punishments for those who do not follow the norm would boomerang on women The experiences of women in China indicate that such coercive policies result in abuse of women Women do not have full control over their fertility, and in a society which places a premium on a male child, such policies are biased against girls particularly those who were born later Regarding the case of millions of Chinese missing girls Terence Hull concludes "If children are being hidden from surveys and registration forms, it is likely that they are also being deprived of the various benefits of child care schooling and protection from exploitation to which they are entitled If they are being illegally aborted put to death or mistreated so as to cause premature death because of their gender, they represent a class of innocent victims whom the state is committed to protect To the extent that this anti social behaviour is a reaction to official family planning policy it is important for the government to develop responses adequate to the challenge" [7] Mary and Laurie also point out that the one child norm was implemented when China was dismantling rural agricultural collectives which was causing much hardship to families and women [8] In India where there is no positive discrimination in policy for girl children the implications of incentives and disincentives for a two child per family norm would endanger the lives of girls and could indirectly induce female infanticide and neglect of girls

[The views expressed here are in my personal capacity]

BARCLAYS BANK PLC

INDIAN BRANCHES

(Incorporated in the United Kingdom with Limited Liability)

Schedule 17—Notes Forming Part of the Accounts for the Year Ended 31st March, 1995

1 Principal Accounting Policies

(a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year Non monetary assets have been carried in the books at the contracted rates

(ii) Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction

(iii) Outstanding forward foreign exchange contracts have been revalued at the exchange rates prevailing at the close of the year and the resultant profit/loss is transferred to revenue in accordance with FEDAI guidelines

(c) Investments

(i) Investments categorised as 'permanent" are valued at cost The excess of acquisition cost over face value is being amortised over the residual maturity and the discount over face value, being unrealised gain is ignored

(ii) Investments categorised as "current ' are valued as follows

- Where quotations are available, on cost or market value, whichever is lower
- Where quotations are not available, on a yield to maturity basis as prescribed by Reserve Bank of India

(d) Fixed Assets

(i) Premises and other fixed assets have been accounted for at their historical cost

(ii) Depreciation has been provided on the straight line method at the rates specified by Barclays Bank PLC In respect of additions during the year, depreciation is provided with effect from the calendar quarter in which the addition is made In respect of sale/disposals, no depreciation is provided in the calendar quarter in which the asset is disposed off

(e) Staff benefits

Contributions to the Gratuity Fund have been made as per actuarial valuation

(f) Net profit

The net profit disclosed in the profit and loss account is after

(i) Provisions for taxes on income in accordance with statutory requirements

(ii) Other usual or necessary provisions

2 An income-tax demand raised in relation to prior year's assessment amounting to Rs 2,598,557 which is, as advised, considered unsustainable in appeal, and hence has not been provided for

3 Current year's figures are not comparable with those of the previous year since they include figures for the New Delhi branch which commenced operations from 6th April, 1995

4 Prior year's figures have been regrouped wherever necessary, to conform to the current year s classification

Auditors' Report on the Indian Branches of Barclays Bank PLC

We have audited the attached Balance Sheet of the Indian Branches of Barclays Bank Plc as at 31st March, 1995 and also the annexed Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date, in which are incorporated the returns of Delhi Branch audited by us

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956 The accounts are therefore, drawn up in conformity with Forms A and B' of the Third Schedule to the Banking Regulation Act, 1949

We report that in accordance with sub section (3) of Section 30 of the Banking Regulations Act, 1949

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory

b) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branches of the Bank

c) In our opinion, proper books of account, as required by law have been kept by the Indian Branches so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the Delhi Branch of the Bank

d) The return of the Delhi Branch has been properly dealt with by us while preparing our report

e) The Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account

f) In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account together with the notes thereon give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31st March, 1995 and of its profit for the year ended on that date

Are you

* Committed to social justice and human rights?
* Willing to travel frequently?
* Able to liaise with the grassroots as well as policy makers?
* Interested in bringing about change in public interest issues, by effectively mobilising citizens and presenting their concerns before policy makers and the media, in short in Public Advocacy work?

Then, we have the following positions at NCAS

1) **Research Co-ordinator** (Research and Publication)
Postgraduate, with 5 years research experience in social science or allied fields and published works, excellent writing skill in English and Computer literacy

2) **Research Assistant** (Research and Documentation)
Postgraduate, with 3 years experience in social research, proven writing skill and Computer literacy

3) **Programme Associate** (Training and Outreach)
Postgraduate,with 3 years experience of working with grassroots groups or social action groups, 2 years of experience in social research and/or training Good communicative skills in Hindi and English, proven writing skill in English

4) **Programme Assistant** (Campaigns and field work)
Postgraduate or equivalent and two years of experience with social action groups, ability to communicate in Hindi and English, proven writing skill in English and preferably in Hindi

So if you are one of that rare breed who is a creative trainer,
Or who is a "grassroots" researcher, with
demonstrated writing skill?
and you want to be a part of our team to develop the
first institution of its kind in South Asia

And if that sounds like just what you want to do, send us your resume with an autobiographical sketch (not more than two type-written pages) telling us what has made you tick all these years, and your vision for Development in India.

Women are encouraged to apply.

Your application, mentioning the post applied for, should reach us before **August 1, 1995**

A Good Business Collaboration Is Like A Handshake. There Is No Upper Hand

Today's business environment is one of global interaction and cross border affiliations. Companies with a common purpose and direction quick to join forces. And yet what defines a perfect business collaboration?

At Colour Chem we believe it is a relationship of equals. Just as the one we share with our global associates – Hoechst AG, Germany.

As a result of this relationship, Colour Chem has access to world class technologies, a reach into international markets and radically different management styles.

Styles that emphasise on quality of the highest order. That lay stress on being concerned on the customer's behalf for his time and money. And that inculcate professionalism within the organisation.

Today, Colour Chem is a company that is on the move. With an established presence in domestic and foreign markets and new horizons to conquer.

We're confident that we will make it happen with our partner in progress – Hoechst AG. Because ours is a relationship of equals.

World Monetary Reform

The present world financial regime displays three major problems persistent misalignment of currencies volatility of exchange rates and abrupt massive movements of portfolio capital The situation calls for flexible relative prices of goods, appropriate money supplies and a Tobin tax on currency transactions In the absence of global co-ordination of national money supplies, there is a case for an international agency to issue bonds denominated in a basket of currencies and to engage in open market operations for world monetary stabilisation **1677**

New Development Strategies

It is neither acceptable nor necessary that financial and economic progress should be paid for by structural unemployment and underemployment which are leading to increasingly widespread manifestations of social exclusion and poverty So long as huge social disparities persist, growth will be certainly a necessary but in no way a sufficient condition of development That is why it is necessary to deal with the five themes of peace, economy environment, justice and democracy all at once, taking social conditions as the starting point for efforts towards development **1682**

Paying for Health Care

Cost recovery through levy of user charges has significant implications for the availability of hospital facilities A study of the auto financing scheme (AFS) introduced in public hospitals in Rajasthan in 1992 provides valuable pointers to the planning and implementation of expansion of public hospital facilities **1700**

Guru's Dilemma

Problems of inter personal knowledge transfer the characteristic of traditional art forms are difficult to overcome without broad based state patronage or a significant development of market based opportunities **1663**

Money Market Tremors

While the acute shortage of liquidity combined with an unrealistic government borrowing programme have imparted a great deal of uncertainty to the money market The market also seems to perceive that the rates of interest on government debt have now peaked The result has been an inversion of the yield curve for government securities **1636**

New Bonds

The struggle of the village-level workers or 'sathins' of the Women's Development Programme in Rajasthan for better working conditions is a comment on the class and gender biases embedded in these programmes beneath the veneer of rhetoric and hyperbole **1645**

BJP's Moves in UP

Using its position as the protector of the BSP government the BJP is trying to instigate low intensity sectarian conflicts in UP especially between the backward castes and Muslims **1643**

Victims of Urbanisation

The Punjab government's latest move to acquire land around Chandigarh ostensibly to construct a residential complex on the city's outskirts to regulate urban growth will result in the displacing of thousands of villagers **1655**

Managing Disasters

The relief and rehabilitation work of the Maharashtra government and NGOs among the victims of the Osmanabad Latur earthquake of September 1993 has served to reiterate major lessons on the importance of community based rehabilitation the role of local democratic processes in ensuring rapid recovery of community self reliance, the superiority of upgradation of local technology to repair and retrofit over wholesale relocation and finally the essentially catalytic role that external agencies can at best hope to play **1654**

Cornering Iran

The placatory tone of Iran's recent statements directed at the US has to be seen in the context of the hardening attitude of the US Congress towards Iran and the deteriorating economic situation in Iran **1662**

LETTERS TO EDITOR

Lessons of Bengal Municipal Elections

THE results of the municipal elections in West Bengal have attracted nationwide media attention because of the setbacks suffered by the ruling Left Front. Elections were held to 79 municipal bodies, out of which the LF won a majority in 39 and the Congress in 29. In 10 municipalities the results were indecisive and the Forward Block(S) won a majority in one municipality. The LF lost control of 14 municipalities and Congress of four, resulting in a net gain of 10 municipalities for the Congress.

The gains made in the municipal elections by the Congress received media attention possibly because nobody expected them and everyone looks at West Bengal as more or less an exclusive preserve of the LF. The reaction in a section of the press was as if by losing control of a few municipalities, the LF had already been dislodged from power in the state. Your journal also carried comments on the subject from two correspondents (June 3). The views expressed by the first correspondent reflected a (more or less) balanced analysis, but those of the second were lopsided. In fact any analysis treating the results of the municipal elections as reflecting the popular mood in isolation from the results of the panchayat elections and the assembly by elections is bound to be wide of the mark.

This is not to deny that the results of the municipal elections were a (positive) signal of popular disenchantment with the existing ruling bodies. But this disenchantment is not restricted to the LF alone, as in percentage terms the losses suffered by the LF and the Congress in relation to their erstwhile strength work out to be about the same. A significant feature of the elections was that where elections were held for the first time the verdict went in favour of the LF. This is possibly indicative of the fact that while the LF remains the dominant political force in the state, there is popular disenchantment with the standards of civic amenities that are in a deplorable state in most municipalities.

It has also been generally overlooked by the media that the phenomenon of the Congress registering gains in municipal elections is nothing new. The Congress has been steadily increasing its share of councillors in the municipal bodies in almost every election, as can be seen from the table.

In the municipal elections there has thus been a gradual but definite decline of support for the LF. The Congress has been increasing its representation by 3 to 4 percentage points in every election and this time also the same trend was in evidence. However, the Congress has not been able to retain its gains in state assembly and parliamentary elections in which political issues play the dominant role. It is reasonable to surmise that this time too the Congress, being totally bankrupt politically, will not be able to hold on to the support gained in the municipal elections.

Year	No of Municipalities	No of Councillors Elected	
		LF	Congress
1984	75	761 (61)	350 (28)
1988	11	160 (61)	85 (32)
1990	74	763 (61)	429 (34)
1993	34	375 (56)	251 (38)
1994	79	823 (52)	650 (41)

Note Figures in brackets are percentages of the total number of councillors elected.

The popular disenchantment reflected in the municipal election results is primarily over the abysmal state of civic amenities in most of the municipal areas. Roads are mostly pot-holed and broken. Water supply is inadequate and unclean. The environment is polluted. There is no sign of any decline in the swarms of flies and mosquitoes. Corruption is widespread. The tie-up between real estate promoters and municipal authorities is all too evident. In such circumstances it is not surprising that the existing authorities in the municipalities have received a strong rebuff from the people, what is noteworthy is that, even in such adverse conditions, the LF was able to win about 50 per cent of the municipalities and get more than 50 per cent of t councillors elected and the Congress, desp having made some gains, is still a dis second. This is a definite indication of influence of the LF parties among the peo including the urban middle class. Electi to the Calcutta municipal corporation due on July 9 and from all indication fight between the contending parties will a tough one.

One thing that has, however, come with stark clarity is that none of the politi parties have any real link with the peo at the grass roots level. Just before municipal elections the chairman of LF had boasted that this time the L performance would be much better than earlier occasions. It is clear that he co make such a forecast only because the parties were completely out of touch w the people. Similarly, the leadership of Congress could not believe that the part candidates had really won in so ma constituencies. Yet these parties claim represent the hopes and aspirations of people. The loss of touch with the peo is particularly unpardonable for the because the parties belonging to the claim to be marxist in ideology and supposed to maintain close links with people at the grass roots level. T important lesson that the LF parties m therefore, learn is that there is no substi for maintaining a close rapport with people, not as their rulers but as t friends and comrades.

Playing Fast and Loose

THE accident at Tarapur when radioactive water found its way into the storm water drain at the waste immobilisation plant is according to the chief of the Atomic Energy Regulatory Board (AERB) a negligible incident On the international nuclear events scale the incident rates well below zero The total radiation dose was well below 100 millicuries Further while routine checks had shown an increase in radioactivity in March only in April was it considered to be statistically significant The contamination took place because of two unlucky things , one a pipe which carries steam under pressure and passes through radioactive waste and is open to radioactive contamination leaked at a joint and two the dilution tank designed to be an extra precaution against leakage of radioactive water had been eliminated at the construction stage And why did the department wait for the leak to be revealed by the press and not take steps itself to inform the public when the leak occurred? We felt there was no need to make a public announcement because we took care of the leak appropriately

This entire episode illustrates very well the extraordinary latitude that has been allowed to the atomic energy department and the nuclear industry in matters which ought to come under public scrutiny First a pipe which goes through radioactive material necessarily exposes its contents to radioactivity which means that the steam passing through it becomes radioactive even if to a small degree Such a system must be considered a primary loop and must logically be a closed one to be discharged periodically and treated This is expensive and the amount of radioactive contamination in the steam pipes was apparently not considered to be high enough to require this sort of handling The alternative adopted was to minimise the radioactivity released by diluting the condensed steam This is done according to the department through dilution tanks, which are therefore essential That one of the steam pipes led directly to the storm water drain because those responsible for construction had dispensed with the dilution tank for whatever reason is not simply a construction flaw It is a serious technical and safety lapse which ought to be the subject of a high level probe Second one may even question whether the method adopted for treating the radioactive waste was indeed the best or whether it was simply the cheapest Third, the fact that a critical pipe joint or joints developed a leak is, to anyone familiar with pipe design, incomprehensible For critical joints even in chemical plants which do not handle radioactive material are subject to a series of tests to establish the integrity of the pipe system and the material used such as pressure tests, non destructive tests like radiographic and ultrasonic scrutiny, and so on This being a critical service the entire system should, following the usual practice in the chemical industry have been tested This would have revealed flaws which eventually developed into holes This clearly was not done and the AERB has chosen to gloss over the lapse Ironically BARC itself sells these testing services to industry Further, the department spokesperson's claim that the leaks occurred due to corrosion is again unacceptable for the design of such sensitive piping systems normally requires that allowance is provided for material deterioration due to corrosion when determining the thickness of the pipes The point is that in any other chemical plant there would have been checks at various levels prompted by various concerns – the interests of the owners of the industry the consultants responsible for the design the construction firm or department, each wanting to safeguard itself against possible accidents later on While even these checks fail sometimes and of course they often delay processes, they do overall contribute to better design, construction and safety standards

In the BARC with its closed loop functioning and obviously insufficient checks and restraints even conventional procedures and practices are apparently often disregarded and dispensed with This is not the first such accident' to have taken place in the BARC and its allied departments, including the power projects There have been serious occurrences at the high profile experimental 100 MW Dhruva reactor and at Cirus once the pride of the establishment An even more serious lapse, though it did not involve radiation exposure, was the collapse of the reactor dome under construction at the Kaiga power project, which has been established as having occurred because of changes carried out at the construction stage without due approval from the technical design group It has time and again been pointed out that even run of the-mill safety lapses at establishments handling radioactive material and processes must be considered dangerous because of their extraordinary potential to cause long term damage And yet it would appear that the quality control and safety measures at the atomic energy establishments are far below chemical industry standards

Finally, the fact that the establishment found it unnecessary to let people know is a gross violation of the right to know If today the atomic energy establishment is finding itself the object of people's ire it is a consequence of its consistent habit of disregarding and disrespecting people Miseducation occurs with lack of information and for that the establishment

has to be faulted At no point in its history has the department taken people, whether villagers at the sites of its projects or the critical informed public into confidence It has ought to bad if misdemeanours behind the cloak of secrecy bestowed on it by the obnoxious Atomic Energy Act and has swelled in the power it gained by its extraordinary political reach beginning in the Nehru Bhabha era Unless the practices of the establishment are open to public scrutiny and audit such accidents will continue to occur posing grave potential risks but also enormous waste of resources and cross inefficiency And such an opening up will be impossible unless India's nuclear ambitions for which the peaceful atomic industry provides a cover are opened up for debate and questioning Nuclear power the other reason for mollycoddling the atomic energy establishment is today an outdated idea everywhere too expensive because of the complex safety measures which have to be taken

FINANCIAL SYSTEM

Dangerous Disarray

THE financial system in the country is in a state of flux It has ceased even if temporarily to serve the primary purpose it is expected to serve that is to provide credit in the right amounts for the right purposes at reasonable cost The root cause of this failure is to be found in the inadequacy of domestic saving The financial system is not entirely to blame for this there is the broader economic policy framework that consciously encourages conspicuous consumption True much the larger part of the explanation for the low overall saving is to be found in the large dissaving by the government though the low saving of the private corporate sector as well as of public corporations is also responsible However the low saving of the public and private corporate sectors is due to the sizeable subventions subsidies and other explicit and implicit transfers which promote extravagant life styles among rich and upper middle class households It nevertheless there has occurred some improvement in household saving in both physical and financial assets it has been because the public financial system has provided not only high returns in real terms but also an environment of stability and risklessness The notion of financial repression makes little sense in the Indian context The institutional build up in the financial sector had a social purpose Banks and financial institutions mobilised savings from the far corners of the country and helped capital formation by households in agriculture and industry

This socially-oriented financial system is being replaced by one which promotes financial activities for their own sake Retail banking has begun to receive step-motherly treatment at the hands of public sector banks and financial institutions not to mention the foreign banks and the newly created private banks The share of the priority sectors in total bank advances has dwindled rapidly Commercial banks have begun to treat rural lending with disdain When what is most needed are efforts to rebuild or restructure rural credit institutions what is being actively promoted is high street banking with the focus on wholesale transactions These new institutions have spawned a culture of financial wheeling and dealing reminiscent of the securities scandal leaving the public sector banks and the few well meaning private banks little choice but to fall in line The recent case of MS Shoes in which five nationalised banks sanctioned bridge loans worth Rs 100 crore and the IDBI alone granted a bridge loan of Rs 50 crore is a typical one The company also used the accommodation bills route to mobilise Rs 50 crore or so through non banking financial companies If there was ever a possibility of cleansing the financial system after the Harshad Mehta capers the unbridled competition in the system introduced by the new private banks with large inter locking arrangements with the public financial institutions (and with industrial houses, domestic and foreign) has effectively scotched it The private banks have been publicising their impressive profits in the first year of their operations outdoing even traditional moneylenders Typically for an equity capital of Rs 100 crore or a little more their profits in the first year have been Rs 80 crore plus Many of them offer 15 to 15 5 per cent interest on certificates of deposit (CD) with an effective cost of 18 to 19 per cent if they pay the stipulated stamp duty (They do not do so always a public sector bank is reported to have nonchalantly evaded payment of stamp duty on an issue of CD worth Rs 400 crore and CD are being quite openly traded in the market) Be that as it may such high cost money is typically lent at rates of interest of 22 23 per cent to non banking finance companies which in turn lend the funds to be deployed in the share and real estate markets Operations of firms like Lloyds Steel, Videocon and Essar Oil represent only the tip of the iceberg The *modus operandi* is the same, namely, accommodation or fictitious bills and bridge loans despite their being explicitly banned At a finance ministry meeting recently an RBI official is reported to have admitted to two commercial banks trading in the secondary capital market in gross violation of central banking directives

Institutions like the UTI and public sector mutual funds, which have been created with the explicit purpose of encouraging households to save in the form of share market instruments, have actually benefited the corporate sector to a greater extent The outstanding example is that of the UTI's Unit 64 scheme Despite repeated assurances that corporate bodies would be discouraged from investing in the units only 35 7 per cent of the sale of units in 1994 95 (July June) was to individuals, against 69 5 per cent in each of the previous two years, on the other hand, corporate bodies accounted for 64 3 per cent of total sales of units in 1994 95 against 20 per cent in each of the two previous years Overall of the outstanding Unit 64 capital as much as 58 9 per cent was held by corporate bodies at the end of June this year What the UTI takes from the corporate bodies is given back to them in the form of secured and unsecured loans apart from investments in debentures and equity capital Term loans unsecured fixed deposits and bridge finance provided by UTI to the corporate sector aggregated Rs 7 794 crore at the end of June 1994 The recent UTI LIC and GIC purchases of Reliance shares to the extent of nearly Rs 945 crore at a premium of Rs 8 per share above the then prevailing market price would not have occurred but for these types of inter locked transactions (The Reliance share is now quoted at Rs 265 or Rs 126 below the price forked out by the UTI and the other institutions)

The earlier policy of the term lending institutions playing a decisive role in industrial development with the IDBI functioning as the apex institution to evolve policies, set priorities and undertake tasks of co-ordination has been given the go by The attempt to dilute the government's equity holding and to infuse private capital into the IDBI to the tune of Rs 2 184 crore is a typical example of the distorted values being promoted in the financial system The over-subscription of the IDBI's equity issue is reported to have come entirely from corporate bodies which have borrowing arrangements with the term-lending institution The RBI too supported the IDBI issue in many ways (a) it waived the 5 per cent of incremental deposits limit for investment in shares of financial institutions and (b) it allowed primary co-operative banks and district co-operative banks to invest in the shares of financial institutions Private provident funds and other trusts were also allowed to invest in the shares It is not surprising that before the issue is allotted, the private companies which bailed out the mega issue have begun offloading the shares in the grey market at a discount of Rs 7 to Rs 9 against the offer price of Rs 130

In-breeding, inter-locking and calling in of favours have become normal features of

the Indian financial system, what with each one of the major financial institutions (UTI, ICICI, HDFC and now IDBI) sporting a commercial bank of its own Given this situation, the scope for the failure of a single leg of multi-cornered transactions of banks and financial institutions, particularly capital market and real estate deals, producing system-wide repercussions is vastly enhanced, creating dangerous possibilities

A major source of the financial sector infirmities is also the steadfast pursuit of a crude monetarist policy by the monetary authorities Sizeable disintermediation is taking place in the financial system with large amounts of funds being mobilised and disbursed by the investment institutions, including private mutual funds and non banking financial companies In this situation, monetary policy impulses sent out through indirect instruments such as interest rates and open market operations generally get blurred In the context of the diversification of the financial markets, even in the developed countries considerable attention is now being paid to the direct effects of monetary policy not only on prices but also on output and employment These effects are visualised in the form of 'credit channels' for monetary policy It is being increasingly accepted that monetary policy actions affect the economy not only through their effect on the liability side of banks' balance sheets that is by affecting the quantity of money, but also through their direct effect on bank lending And when it comes to bank lending, not only its size but also its distribution matter

The current framework of monetary policy has stimulated expectations of usurious rates of interest on banks' assets thus jeopardising growth It has also ensured that the interest burden on the government is so heavy that there will be no end to the fiscal crisis The RBI's steadfast refusal to focus on credit as a policy target and to render sector specific refinance and rediscount facilities for such areas as agriculture, small scale industries and other small borrowers – a policy which the south-east Asian countries such as South Korea pursued with great success has deprived monetary policy of the ability to play an effective role in promoting geographically and sectorally diversified industrial development

POLITICS

Glossing over the Past

A correspondent writes

THE CPI(M) and the CPI have started a slanging match over the Emergency of 1975 The CPI(M) general secretary, Harkishan Singh Surjeet, has launched a blistering attack in the party journal on the CPI's role as a collaborator during the Emergency – a role which the CPI cannot hope to live down The veteran CPI leader, Chaturanan Mishra, has retaliated with a press statement, accusing Surjeet and his party comrades of having defended China during the Sino-Indian war

While Mishra admits later in his statement that both the CPI and the CPI(M) have committed mistakes in the past and reasserts the need for the unity of communists and left forces in India, without which they can never "get rid of trailing behind this or that bourgeois combination" he is rather furtive in his attempts to gloss over his party's role during the Emergency Replying to Surjeet's accusation, Mishra says that the 1978 Bhatinda congress of the CPI had already admitted that the party had committed several mistakes by supporting the Emergency and hence there was no need to rake up the past He also claims that during the latter phase of the Emergency his party had fought its excesses and incurred Sanjay Gandhi's wrath

But the Bhatinda congress had been a half-hearted attempt to analyse the basic political strategy of the party that had led to the mistakes and a hurried opportunist effort to get back on the bandwagon of the leftist mainstream in the post-Emergency period The Bhatinda congress attributed the party's support to Indira Gandhi during the Emergency to its erroneous assumption that a split had taken place between the anti imperialist democratic sections of the bourgeoisie (obviously represented by Indira Gandhi) and the reactionary sections, and to its failure to fight against the anti people internal policies of the Indira government while supporting its "anti-imperialist foreign policy" and its 'progressive internal measures' But here again the Bhatinda congress had landed in a contradiction when it acknowledged that since 1974 the Congress government had been making concessions after concessions to the World Bank" So where was the anti imperialist foreign policy which the CPI sought to discover in Indira Gandhi's regime? What again were the 'progressive internal measures'? Forcible sterilisations, demolition of slums press censorship, suppression of workers movements? The Bhatinda congress had failed to define what it regarded as 'progressive internal measures' during the Emergency

Further, the Bhatinda congress had refused to come out clearly against the imposition of the Emergency In fact, it repeated the same rhetoric to describe the anti-Indira opposition that had emerged on the eve of the Emergency - 'extreme reaction in the name of total revolution under JP's leadership" This theory became the basis for the CPI's support for the imposition of the Emergency, for convening an 'anti-fascist' conference in Patna and for denouncing as fascists those who were fighting against the authoritarian regime The impression gathered from the Bhatinda congress deliberations was that while the CPI had no objection to the imposition of the Emergency (in order to suppress what the party regarded as 'extreme reaction with which it identified the JP movement, as it still continued to do in 1978 during the congress), it was disappointed by the evil effects of the Emergency on the life of the people'

In any case Chaturanan Mishra's claim of his party having fought the Emergency excesses needs to be taken with a liberal dose of salt In the absence of any concrete evidence of such resistance, we have to rely on the statements made by party leaders in those days Even as late as May 1976 by which time the fallacy of fighting rightist forces under the cover of the Emergency must have become clear to CPI leaders and activists, the party journal *Party Life*, described Indira Gandhi's 20 point programme as the democratic counter offensive against the diabolical plans of internal reaction and imperialism at which the Emergency undoubtedly struck a heavy blow

It is about time that the CPI made a clean breast of the blunders it has committed from the 1960s onwards when it began its close collaboration with the Congress, leading to the complete capitulation during the Emergency This is essential for making a clean break from that obnoxious past if that is what the party really wants to do

NUCLEAR TESTS

Mockery of NPT

WHILE the fall in sales of French wine in Australia may not be of consequence outside France it is nevertheless an indication of the sustained protest that the French decision to resume nuclear testing in the South Pacific has generated Protest has been building up over the last couple of months after president Jacques Chirac announced reversing the earlier policy of Francois Mitterrand a programme of eight tests almost on the heels of the signing of the renewal of the nuclear non proliferation treaty in June According to French spokespersons, the country's programme of developing an independent deterrent before a universal nuclear weapons ban comes into force would not be complete without these tests The point however is that even for this purpose France could well have opted for computer simulation, which it did not

The French decision has also laterally lent support to China's decision to resume nuclear testing, for which the country was facing considerable flak from Japan. Japan has now used unusually harsh words to condemn the French decision, calling it "a betrayal of the trust of non nuclear states". This indeed is at the core of the anger over the French action not only in Australia and New Zealand but also in the island nations of the South Pacific which will be the most affected by the tests. The fears of these island nations are not unreasonable given that accumulated data on the long term effects of nuclear tests have recently become available. Protests around the Mururoa test site and anti-French campaigns in the French Pacific territories have also led to the calling of a South Pacific trade union meeting, including representatives of major unions from Australia and New Zealand later this month in Australia. Such a coming together for the first time shows that opposition to these tests has mounted not diminished, during the time that the French held off testing. This has in turn prompted the French Socialist Party to join the communists and the greens in endorsing the opposition to the tests.

Ironically none of this is likely to have much effect on the French government because as of now there are few safeguards which prevent or even regulate testing of weapons or systems. This was in fact a sticking point in the debate during the review meetings which led to the signing of the NPT. The entire discussion during that time was focused on whether or not the treaty should be given permanency or whether it should be renewed for a short period and left open for review again. The fact that the various other agreements which would have made the treaty more meaningful such as the test ban treaty or the one against the production of fissile material for weapons had been in limbo for long periods was deliberately kept out of the discussion. Interestingly the US which in the course of the debates had sought to assure non nuclear nations that these and other safeguards would be secured has been widely reported to be considering a resumption of underground testing of low yield weapons for experimental purposes. China too carried out one test last month, bringing its total to 42 since 1964.

The resumption of testing makes a mockery of the NPT and all the fears expressed by the non-nuclear nations that the treaty will simply make the nuclear club even more exclusive have been borne out. A further point which adds to the anxiety of the non-nuclear nations is that the International Atomic Energy Agency which more than six months back had proposed more stringent monitoring measures appears now to be backtracking, with little movement in that direction since the NPT was signed. If the global nuclear situation is not to slide back to what it was in the 1960s, there must be concerted efforts, especially by South Asian nations, to strengthen non proliferation, even if this be in terms of regional agreements.

MAHARASHTRA

Cosmetic Decisions

A correspondent writes

THE Shiv Sena BJP government is not strictly speaking the first non Congress government in Maharashtra. It is nevertheless the first one without a Congress flavour. However not only has the SS BJP combine comfortably survived its first assembly session it has shown that it can play the game of defections with as much cynical finesse as the Congress Party. Starting without a clear majority, the government now faces the budget session of the state assembly with a large enough majority.

By and large in the past the Congress has fared poorly in urban Maharashtra, with the result that even though Maharashtra is the most urbanised state in India, the state's cities have been poorly represented in the ministries in the past. This anomaly has been rectified in the present ministry with all the major cities having fair representation. An urban tilt in the state ministry was perhaps coming anyway. However in the past four months the urban tilt has hardly made a difference. True the SS BJP ministry announced changes in the names of Bombay and Aurangabad and among a section of its supporters this has been hailed as an achievement. The government has also announced a ban on cow slaughter and made known its intention to ban state lotteries and matka gambling. Starting of hundreds of 'zunka-bhakar' centres to supply cheap nutritious food was an election commitment of the combine and the first such centre was started with fanfare on May 1 which is Maharashtra Day in the state. However, none of the 20-odd centres started so far are working satisfactorily. The decision of the government to keep prices of five basic necessities sold through the public distribution system unchanged for the next five years is rendered virtually meaningless in practice because the PDS shops are chronically short of supplies. Thus two decisions of the government which could really benefit the poor are likely to be rendered ineffective in practice.

It is now an accepted practice for a new chief minister to ease out from strategic perches civil servants known to have been close to the previous regime. For smooth functioning of the ministry, this is often necessary. Sudhakar Naik had shifted several officials when he took over the chief ministership from Pawar, who in turn brought many of them back when he returned to state politics. The Joshi ministry has also transferred many officials, including the chief of the State Electricity Board, revenue officials in Pawar's home district and many police officials in Bombay and other cities. What is notable is that the new government has taken no such action against a number of officials who are known not to have a clean image.

The co operative sugar mills in Maharashtra now numbering over 100, have come to dominate the political and social activities of rural Maharashtra. Those who control a sugar mill are able to dominate all aspects of rural life in the particular area. Most of these mills have become monopolies of a few families and because of their proximity to Congress ruling circles gross irregularities and abuse of power on their part have been overlooked. The new government has come down on many of these managements. Administrators have been appointed for a dozen sugar mills and more may be in the offing. Neither the Shiv Sena nor the BJP has much of a presence in the sugar lobby and consequently in the established power structure in rural Maharashtra. Clearly the action against errant sugar co operatives, though overdue is an attempt to gain a foothold in the sugar co operative sector.

Water shortage has been a chronic phenomenon in Maharashtra in the summer months for years. This year has been no different and no attempt has been made to resolve the problem. Similarly other than adding another 5 to 10 per cent seats in every class in schools and colleges there has been no effort to cope with the demand for expansion of educational facilities. A purposeful government with clear ideas and a well defined set of priorities can achieve a great deal even in four months. What is seen in Maharashtra is, however, the same *ad hoc*ism and the same reluctance to break out of bureaucratic sloth as exhibited by the earlier Congress ministries. The new SS-BJP government does not give the impression of a government wanting to change things, but only of a government with a new set of functionaries wanting a piece of the action for themselves. Its credentials are soon going to be severely tested in respect of the Enron project. While the state government is procrastinating over the issue, work on the project continues at a brisk pace. Obviously, for the BJP part of the coalition at least, the question is whether to succumb to the short-term temptations of being in office at the cost of the party's long-term credibility.

TATA IRON AND STEEL COMPANY

Back to Steel

THE year 1994-95 was a rewarding one for Tata Steel The total income of the company grew by 22 per cent to Rs 4,627 crore, operating profit by 45 per cent to Rs 762 crore and profit after tax at Rs 281 crore was the highest ever achieved Interest and depreciation charges rose by 28 per cent and 40 per cent, respectively, this being attributed to the fact that during the year additional fixed assets of Rs 1,186 crore became operational leading to an increase in depreciation provision and reduction in interest capitalised

The company recorded the highest ever physical sales of 2 221 million tonnes in 1994 95 up from 2 014 million tonnes in 1993 94 Tisco's domestic market share has improved from 13 to 15 per cent and, according to Ratan Tata, chairman the company will endeavour to remain a leading force in India s industry in the coming decades With the opening up of the economy, industries being taken out of rigid control and import duties being reduced there has been a proliferation of pig iron and steel projects in the last two or three years The mood in the construction, engineering goods and manufacturing sector has been buoyant and, steel being an important input in these industries, demand for steel and steel related products has grown by 9 5 per cent Tisco has been able to capture 30 per cent of this expanded market

Keeping this in mind exports were strategically reduced to cater to the buoyant domestic market Exports dropped significantly by 27 per cent in 1994 95 over the previous year Export earnings went down by 24 per cent an important reason being the fall in exports of chrome ore and ferro chrome due to difficulties experienced by the company in the movement of raw materials Also China, an important market importing over 15 million tonnes of steel, could not maintain its imports because of foreign exchange difficulties

On the domestic front Tisco has made significant progress by incorporating three new technologies in its steel-making in order to retain its competitive edge In 1994-95 the company has been able to fully substitute dolomite with cheaper dunite for making sinter The use of dunite sinter has twin advantages It reduces costs and increases blast furnace productivity by around 4 5 per cent Besides, Tisco can source the entire dunite from its captive mine at Dodakanya in Karnataka which has a total recoverable deposit of approximately 11 7 million tonnes Substantial cost savings to the tune of Rs 100 crore seem to have accrued to the company as a result of this substitution

The company had started the coal injection process in 1991 using the Kleckner Stabetechnik technique from Germany Last year the company was able to extend this technique to two more blast furnaces Coal injection brings down cost of hot metal by 10 per cent compared to coke operations, thereby cutting down on coking coal requirements This would also help to check the high expenditure incurred on importing coking coal from Australia Tisco is the first steel plant in India to exploit this technology The company also made a breakthrough by completely substituting magnesite carbon bricks with dolomite bricks

The company has many projects on the anvil Tata Korf Engineering Services, a subsidiary of Tata Steel, which supplies technology for mini blast furnaces based iron and steel plants has signed a collaboration agreement with Switzerland s Maerz Ofenbau for design, engineering and supply of parallel flow regenerative twin shaft kilns for calcination of limestone and dolomite Tisco plans to set up a fully integrated stainless steel plant in Orissa which will use Tisco's own ferro chrome from its Sukhinda mines Expansion plans include Tata Steel's automation division The division will see major expansion of operations in the area of in house automation and commercial exploitation outside of products developed by it The division which has contributed around Rs 130 crore is poised for further growth

Tisco is all set to embark on its fourth phase of modernisation This phase aims at doubling the capacity of the hot strip mill which was commissioned during the latter half of 1993-94, from the present 1 million tonnes to 2 million tonnes A new bar and rod mill is also on the cards The third phase which stands completed has increased the saleable steel capacity from 2 1 million tonnes to 2 7 million tonnes Modernisation has led to a practical rebuilding of the entire plant This would not only convert the plant into a brand new one but also enhance its finished steel capacity by around 10 per cent J J Irani, managing director, has indicated that there would be a phasing out of plants in such a manner that by 1988 the age of all the plants would be less than 15 years The company has decided to utilise its Rs 742 crore issue to partly finance this modernisation programme

In what seems a reversal of past policies, Tisco from now on proposes to concentrate solely on manufacturing and marketing of steel and steel-related products To quote Ratan Tata, "the company took over various sick enterprises, some for questionable reasons, entered related businesses where its market presence was insignificant, invested in mineral mining enterprises with a view to becoming a global mineral trader and went extensively into international trading in a variety of unrelated goods and commodities where the company's financial strength and liquidity were used to some advantage While these decisions may have had their validity at one point in time, the need in today's highly competitive market is to re focus on the company s main business

The last union budget affected a reduction of import duty from 40 per cent to 30 per cent while the excise duty structure was kept at 15 per cent Small steel plants have reportedly closed down citing the adverse excise regime this is likely to benefit a giant like Tisco The proposed 7 per cent hike in freight charges for coal and other minerals used as basic raw materials is likely to lead to an increase in the average cost of production of steel by around 10 per cent in value terms Irani had hinted that this might lead to an increase in the prices of steel and, with effect from April 11 this year Tisco has hiked its price by Rs 1 000 per tonne Considering that Tisco has its production base located near the mines, the justification for the increase may be open to question

LARSEN & TOUBRO

Focus on Customer Service

An engineering and construction company with assets worth Rs 4 117 crore and one of India's corporate giants, Larsen & Toubro (L & T) was incorporated in 1946 to manufacture engineering items relating to civil electrical chemical and agricultural engineering and contract work involving exports and imports The company has once again posted excellent performance for the year ended March 1995 A big boost of over 19 per cent in sales which rose from Rs 2 561 crore in 1993 94 to Rs 3 054 crore in 1994 95 was provided by the buoyancy in the cement industry in general and in particular by the commissioning of the 1 75 mtpa Himri cement plant in Madhya Pradesh which went on full stream in March 1994

Income from operations not connected with manufacturing fell by around 10 per cent, but total income accruing to the company increased by over 20 per cent in the period under review Operating profits went up by 28 4 per cent while net profits were up by 41 8 per cent from Rs 195 64 crore to Rs 277 36 crore

Equally impressive performance was recorded by L & T's subsidiary and associate companies with sales and other income showing considerable improvement over the previous year L&T-McNeil, Audco India, EWAC Alloys, Tractor Engineers, L & T Niro and L & T-Chiyoda posted satisfactory results

Not the same can be said for exports which went down by 16 per cent But there was a silver lining in the form of increase in export earnings from construction and related activities which went up from Rs 73 crore to Rs 165 crore Imports of capital goods, components and spare parts came down substantially as a result of indigenisation and research and development

The investment made by the company in research and development of new products, processes, methods, materials, machines, tools and improvements of systems of existing products/processes seems to have served the company well leading to indigenisation, cost reduction enhancement in quality, service to the customers and above all in maintaining market leadership These changes being long term in nature their effects will be felt over a period of time The company increased its investment in R and D from Rs 13 30 crore in 1993 94 to Rs 14 45 crore in 1994 95 The company has introduced a modular multifunctional flame spray powder delivery system for high quality coating in applications beyond conventional spray equipment It has also introduced a new software product APEX the application express This package is user friendly and provides a fast application programming interface

The company booked orders for cement machinery and for the first time an order for reburning kiln was received during the year This environment friendly process reduces the demand for fresh lime

In the area of dairy products the company set up the first vertical dairy plant with a capacity of 4 lakh litres per day at Noida (UP) near Delhi The concept has been introduced to take advantage of the limited land available in the city

In the area of petrochemicals and refineries the company completed the construction of a captive power plant for the Mangalore refinery and the Kandla Bhatinda pipeline project in consortium with Skoda of the Czech Republic progressed well with the company adopting novel techniques for welding thereby eliminating the need for costly imported equipment Other major projects completed during the year include cement plants for Grasim Industries at Chittorgarh in Rajasthan and at Raipur in Madhya Pradesh for ACC at Marhar in Madhya Pradesh and for Lakshmi Cements in Rajasthan

L & T is currently into its 51st year of construction with the founding of Engineering Construction Corporation (ECC) in 1944 The company was merged with L & T in 1984 and now functions as the construction group of L & T ECC is executing some major projects in India and abroad with the thrust on infrastructure projects On the domestic front the company has a number of projects on the anvil In the road construction segment these include widening the highway between Rourkela and Sambalpur construction of a 40 km expressway between Durgapur and Calcutta and four laning of the 25 km road between Bangalore and Hosur The group has also received orders in the steel plant sector for civil and mechanical work from clients like Jindal Vijaynagar Steel, Nippon Denro Ispat and Kirloskar Ferrous Industries

A proposal to set up thermal power projects in five states (one with a 500 mw capacity in Orissa) has been submitted, the rationale behind this move being the company's

expertise in the construction of power plants. L & T in association with Volth-Sulzer is executing an order from Tamil Nadu Newsprint & Papers It has designed a paper machine having a speed of 1 000 metres per minute, probably the largest and fastest machine as also the only machine in the world producing newsprint using 100 per cent bagasse

L & T with Voest-Alpine Industrie anlagenbau (VAI) has signed a contract with SAIL for modernisation of the Bokaro steel plant It also has ambitious expansion plans for its telecommunications division plans to enter the basic telephone services segment and has proposed a network using advanced technologies

The company has penetrated into the international arena It has floated a JVC along with Al Zubair in Om in called L & T Oman for construction activities in the Gulf with a 50 50 equity participation Among its overseas projects constructing a township for Russian soldiers returning from Eastern Europe to be ready in a record time of 11 months and valued at Rs 160 crore structural works for upgrading the Trishuli Devighat power plant in Nepal and construction of a sports stadium in Iraq an international airport in Abu Dhabi and bridges in Malaysia are a few of the important ones

L & T has tied up with Sargent and Lundy USA a global player in power plant engineering to offer services for thermal power projects and also to form a joint venture company The company along with Community Energy Alternative Inc of the US has signed a Memorandum of Understanding with SAIL to set up a steel plant at Bhilai in Madhya Pradesh

L & T is diversifying into engineering consultancy for hydrocarbon based processes It has set up a joint venture in Baroda with a Japanese engineering consultancy firm Chiyoda taking advantage of the lower human resources cost in India The company plans to finance these expansions from the $ 135 million Euro issue which it placed mainly with institutional investors in the US Europe and Asia in November 1994 Recognising the company s strength the issue met with an enthusiastic response the result being that the company s share capital went up by Rs 16 17 crore

L & T has placed renewed emphasis on technology, quality quicker response, flexibility in manufacturing, customer service and improvement in productivity – all integral to the central objective of providing the customer with products and services of international standards According to S D Kulkarni, managing director and chief executive officer, the focus today is on the customer and 'delighting the customer' is the central objective of the company

Many of L & T's business lines have received the ISO 9000 certification in recognition of sustained quality standards The construction group won the Industrial Promotion Award (Gold Medal) for 1994 for excellence in construction and innovativeness. The company has also been rewarded with the Good Corporate Citizen Award from the Bombay Chamber of Commerce and Industry for 1994-95 "for its conspicuous achievements in improving the quality of life in the country"

PREMIER AUTO ELECTRIC

Getting Ready for Automobile Boom

Operating in the replacement market for automotive parts with a wide network of over 21 branches all over the country and over 6,000 dealers PAEL has reason to be satisfied with its performance in 1994 95 Net sales were up more than 20 per cent from Rs 73 61 crore in 1993 94 to Rs 88 85 crore in 1994 95 Total income increased by 29 32 per cent from Rs 76 98 crore in 1993-94 to Rs 99 55 crore in 1994 95 Other income increased by 117 per cent from Rs 2 98 crore in 1993 94 to Rs 6 47 crore – a small contribution being made by the surplus on the sale of the polymer unit at Halol, Gujarat Gross profit jumped from Rs 7 05 crore in 1993 94 to Rs 10 35 crore an increase of 46 per cent The rise of 143 per cent in depreciation charges was neutralised to a small extent by a 15 per cent fall in the provision for taxation Net profit was up from Rs 4 45 crore to Rs 6 03 crore an increase of over 35 per cent Rs 1 90 crore have been earmarked for equity dividend an increase of over 24 per cent over Rs 1 53 crore set aside for the same purpose in 1993 94

Broadbasing its product range and geographical coverage diversifying into leasing and being quick to recognise policy changes at the national level seem to have augured well for the company It has withstood the automobile recession and maintained its progress Decentralisation of management has also played an important role

During 1989-90, when the recession was just beginning and the market was being flooded with Maruti cars adversely affecting the profitability of Premier Automobiles Premier Auto Electric decided to set up a Rs 2 65 crore plant to manufacture automobile components based on polyurethane Again it was quick to realise the non-viability of this plant in the face of new competitors who came in with economic liberalisation and reduction in import tariffs and sold the plant and acquired the auto products division of Best and Crompton Engineering in Madras This division manufactures starter motors and alternators and their parts for automobiles Meanwhile PAEL has been getting into related diversifications It has invested Rs 6 lakh in the capital of INAPEX Auto Products Exports in an attempt to secure orders for auto components placed with INAPEX by global manufacturers At the same time it has also been adding to its existing marketing lines During 1993 94 it started marketing Metropolitan coil springs Motorol oils Toyo horns Gabriel shock absorbers, Alpump water pumps UCAL fuel systems and Indrad auto components

Growth incentives in the form of tax reliefs and a reduction of 5 per cent in excise duties on a number of components have further contributed to increased profits

PAEL may find a possible collaborator in Echlin of the US Echlin the world's largest automotive parts retailer is interested in the strong distributive network of PAEL With a large number of foreign automobiles ready to hit the Indian market over the next three years Echlin is estimating a large replacement market in India

Centre for Multi-Disciplinary Development Research

REGISTRATION FOR Ph.D DEGREE

CMDR has been recognised by different Universities as a Centre for guiding candidates desirous of doing **Doctorate (Ph.D) in Economics** Those holding Masters degree in Economics with a good second class (M Phil degree from a recognised University is an added qualification) are eligible to apply An entrance test may also be held before registration is approved Preference will be given to full time candidates A few Fellowships-Assistantships are also available Applications with detailed Bio-data of the candidates with a note on the research topic should be mailed so as to reach the Director on or before **14 August 1995**

Prof P R Panchamukhi
Director

CURRENT STATISTICS

There has occurred a sharp loss of over $ 1.1 billion (Rs 4 174 crore) worth of foreign exchange during April June quarter probably due partly to repayments to the IMF and partly to the growing current account deficit. The loss of reserves has begun to dampen liquidity growth despite phenomenally high levels of central government recourse to the RBI (Rs 16 931 crore against Rs 2 415 crore last year) both reserve money growth and M_3 growth have decelerated. The loss in bank deposits over March 31 is much larger than last year but is in advances. The performance of the capital market reflects the all round liquidity shortage. Capital issues launched during recent months have dwindled and share price indices have lost more than one fifth of value over the past year. FIIs continue to make net investments the latest figures for May and June being $ 65 million and $ 114 million respectively.

A Dearth of Ideas

While the acute shortage of liquidity combined with an unrealistic government borrowing programme has imparted a great deal of uncertainty the money market also seems to perceive that the rates of interest on government debt have now peaked The result is an inversion of the yield curve for government securities

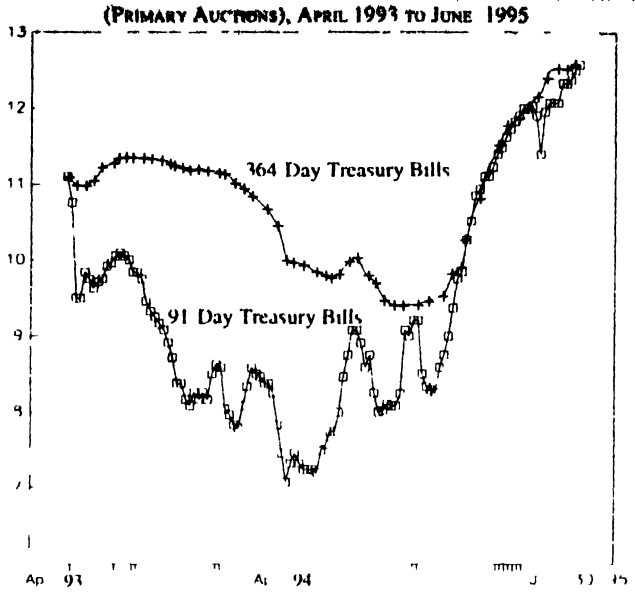
I
Macro Events

Unsustainable Policy on Ad Hocs

THE financial system has begun to face considerable uncertainty the cause of which is rooted in socio political repercussions of the impact of four years of economic reforms The authorities who are anxious to push through their reform agenda have responded to the situation in two ways While keeping every major aspect of reform on hold for the present, they have offered many palliatives for the poor All the same time they appear short of ideas to resolve such immediate problems as liquidity shortage and fiscal crisis As a result the money market psychology is being increasingly dominated by the dire straits into which the central government finances have fallen during the current fiscal year An acute shortage of liquidity combined with an unrealistic government borrowing programme is imposing a heavy strain on the system which is in turn reflected in reported shortages of institutional finance for manufacturing firms, deferment of many share capital floatations by companies and an all round firming up of interest rates all of which put together threaten to place a break on the recovery process A benchmark rate of 14 per cent or a real rate of interest of about 5 to 6 per cent per annum on medium and long dated sovereign debt is not only unprecedented but also lacks economic logic The market expectations in this regard have been stimulated by the government's helplessness The conventional hypothesis advanced by neo classical economists that high real rates of interest would induce the government to reduce its dependence on debt financing is being proved to be fallacious so also is the notion that the rates of interest on commercial loans rendered by banks and financial institutions would be reduced once government borrowings are undertaken at market related rates of interest On the contrary it should be considered as reflecting the ambience of a free market financial system that public sector banks should even toy with the idea of raising their prime lending rates in response to the government's loan floatation at a high coupon rate of 14 per cent, one of the term financing institutions has been quick to raise its prime lending rate, the third in the past one year though its unusually high profitability ratio should have enabled it to absorb, in the interest of helping economic revival, the possible additional cost it may have to incur in future market borrowings If the financial system ceases to be guided by broader socio political considerations the usurious rate of interest becomes the obvious consequence in a saving scarce economy

If only to retain the credibility of the central banking actions the agreement reached between the central government and the Reserve Bank of India (RBI) on the limit for net issue of *ad hoc* treasury bills reached last year has been renewed for the fiscal year 1995 96 the limit of Rs 9 000 crore prescribed for 1994 95 has been retained The central government had budgeted for a budget deficit of Rs 5 000 crore for 1995 96 as against Rs 6 000 crore budgeted, or actually a surplus of Rs 1 100 crore during 1994-95 During the current fiscal year so far up to June 16 1995 the recourse to *ad hoc* TBs has touched a historically high figure, for the period of Rs 13 635 crore in contrast to a net cancellation of *ad hocs* to the extent of Rs 1 035 crore during the corresponding period of the previous year (Incidentally, the RBI's decision to publish the figures of *ad hocs* on a weekly basis should be welcomed)

Since April however, the government has started drawing excessively through *ad hocs* and by the beginning of May it had crossed the target of Rs 9 000 crore, possibly for more than 10 consecutive days In keeping with the agreement the RBI had to issue fresh government paper even if it meant contrary to normal practice and prudence bunching of issues The fresh issues included dated paper 364 day TBs, and also 91 day TBs the auction amount for which was raised from Rs 50 crore to Rs 500 crore in a matter of only four auctions between April and May The lukewarm response of the market however did not allow the level of *ad hocs* to come down significantly till about the end of June It was only then that some inflow of funds through advance tax collections appears to have resulted in bringing down the level of *ad hocs* It will be almost two weeks before the actual figures on this count become available



The liquidity situation has placed both the government and the RBI in a bind The massive market borrowing programme of Rs 32 643 crore (gross including conversion of probably the whole of Rs 13,000 crore of 364-day TBs due for redemption) or Rs 28,087 crore (net) for the year 1995-96, possible difficulties in achieving the target of Rs 7 000 crore under disinvestment of public sector equities and the anticipated overshooting of expenditures only to be partly met by probable increases in tax revenues combined with excessive borrowings through *ad hocs* so far this year and the requirements of large amounts of redemptions of past government securities and 364 day TBs (worth more than Rs 17 000 crore now due) raise serious doubts about the government's ability to limit the size of deficit financing to observe the agreement in letter and spirit and to phase out *ad hocs* by 1996 97

While these developments have imparted considerable degree of uncertainty the money market also seems to perceive that the rates of interest on government debt have already peaked a phenomenon which is reflected as explained later in an inversion of the yield curve for government securities Some degree of market resistance is also seen in regard to rising interest rates on commercial loans Banks and financial institutions (except one) have been forced not to raise their prime lending rates It is interesting to see some of the public sector bank chairmen now arguing that there was no case for raising banks prime lending rates after having raised them twice over in the recent past from 14 per cent to 15 5 per cent Likewise major financial institutions like the IDBI and IFCI which have 45 to 60 per cent of their resources internally generated have begun to argue that though marginal cost of borrowings has gone up, they would still be able to maintain their spread of over 2 5 percentage points without increasing the prime lending rate Recent reports have shown how the small and medium scale industries are finding interest charges generally exceeding 18 5 per cent that is three percentage points higher than the prime lending rate onerous and uneconomic The market resistance to unusually high rates of interest is also getting reflected in many big size companies showing increasing reluctance to tie themselves up into long term borrowings as they perceive that the present rates are unrealistic, that the rates should begin a declining trend after a while reports suggest many big companies have instead been scouting around in the market for raising short term capital through 12 month to 18 month non convertible debentures (NCDs)

New Investment Rates for Private Provident Funds

Towards the end of May, the government amended the guidelines with regard to the permissible investment patterns of non-government provident, superannuation and gratuity funds The earlier 55 per cent of the total corpus required to be invested in special deposit schemes of the government (roughly at 12 per cent rate of interest) has been reduced to 30 per cent, with the balance 25

GRAPH A: CUT-OFF YIELDS OF 91-DAY AND 364-DAY TREASURY BILLS (PRIMARY AUCTIONS), APRIL 1993 TO JUNE 1995

per cent being earmarked for the first time, for investment in central government securities another 15 per cent will be continued to be invested in state government securities or other securities guaranteed by central or state governments Likewise as in the past the residual 30 per cent is allowed to be invested bonds and securities of public financial institutions and PSUs and certificates of deposit of public sector banks The budget for 1995 96 has shown fresh accruals under the special deposit scheme at about Rs 8 964 crore as against the revised estimate of Rs 8 890 crore for 1994 95 The annual accruals under the non government provident funds etc, work out to about Rs 16 000 crore and as a result of the new guidelines the additional investment accruing to central government paper would be of the order of about Rs 4 000

Being of course swapped for special deposits such accruals cannot be an additional source of funds for the government Even so the new arrangement will bring in a whole category of new investors into the government securities market with goals of long term investment which should be helpful particularly when the SLR requirements on banks are being reduced Since July 4 1994 the non government provident funds have been allowed to participate in the 91 day TB auctions on a non competitive bid basis there is no such arrangement for 364 day TBs Such funds can participate in the government securities floatations through the sub accounts of the RBI s subsidiary general ledger (SGL) with the help of their bankers

Repo on NSI

The National Stock Exchange (NSE) in the meanwhile began to deal in repurchase transactions on June 24 on the eve of it completing the first year of operation in wholesale debt instruments Within a few days worth Rs 44 crore have been transacted with implicit interest rate of 16 per cent each (Table 5) The transparency on the cost of repos has been made possible because of the NSE s insistence on the parties revealing both the legs of the transactions the difference between the buying and selling prices being the interest for the period on the funds availed of

Hitherto the RBI s SGL data provided information on repo transactions based only on the sale leg of the transaction and hence the implicit yield rates have been conspicuous by their absence The RBI has so far not been insisting on banks supplying information on the second leg Albeit is a precursor to introducing the delivery versus payment system the Reserve Bank has for the last few months been asking banks to provide this information on a voluntary basis It is learnt that the banks had been more or less complying with this requirement Now that the DVP system will commence from July 17 banks will have to reveal the prices of both the legs of repo transactions and it is hoped that the RBI will reveal the relevant information for public consumption which will in turn provide transparency competition and some benchmark for money market operations

Current Portfolio

On June 20 the Reserve Bank of India issued a circular to banks asking them to increase the ratio of their current portfolio to 40 per cent from the earlier 30 per cent The RBI has argued that there should be a rapid transaction to a fully marked to market basis of valuation of investments it has therefore been prescribed that for the year ending March 31 1996 the ratio of current investment should be increased to 40 per cent With a sharp depreciation in the prices of older securities with relatively low coupon rates the Reserve Bank therefore prescribed for the first time in April 1992 that banks should bifurcate their securities portfolio into permanent and current in the ratio of 70 30 respectively

DAILY

MAY 1995 AND JUNE 1995

In his address to the participants at a conference organised by State Bank of India last month RBI deputy governor S S Tarapore did indicate that banks needed to review their portfolios constantly and ideally mark their entire securities portfolio to market. Banks should be able to do this from their profits rather than depend on the government to infuse up till to write off the losses on this count (or any other count too) against this dole. According to Tarapore as much as 40 per cent of the banks' securities portfolio had been acquired after March 1992 and as such there should really be no hardship to banks in having a fully marked to market valuation system. Having a fully marked to market portfolio will give an impetus also to the activity in the secondary market in government securities.

SICI's Two way Quotes

A further development in the debt market was the Securities Trading Corporation of India (SICI) beginning to offer two way quotes in dated securities and TBs from June 26. This is perhaps indicative of the fact that primary dealership for this institution may not be far away.

The Reserve Bank also announced names of 11 private sector mutual funds to access the money market as lenders. The credit policy announced this April had permitted private sector mutual funds to access the overnight money market as lenders.

Government Bond Indices

As an indication of the growing interest in the debt market, two indices of government bonds were also introduced during last month. One weighted index has been developed by I Sec, the securities trading arm of ICICI and the other unweighted index constructed by Credit Capital, these should serve as a benchmark against which fund and investment managers could evaluate the performance of their portfolios. I Sec hopes to introduce a similar index for public sector and corporate bonds at a later stage.

The I Sec bond index covers securities of one to ten year duration and those instruments which have fixed coupons and are traded. It thus excludes most of the longer dated and low coupon securities which are not traded. Of the two components of the I Sec index while the *total return index* captures the composite return that the bonds offer over the base period in the form of both the accrued/actual interest payment and capital gains/losses the *principal return index* reflects the movement of net prices in the bond market that is, prices quoted in the market exclusive of accrued interest.

As recent data indicate between the base period August 1, 1994 and June 30 1995 *total return index* has improved by 5 1 per cent that is an investment of Rs 1 000 on base data has improved to Rs 1 051 reflecting roughly an increase in interest by 8 45 per cent which has been partly offset by 3 34 per cent of capital losses with the *principal return index* falling to 966 47 as on June 30.

II
Government Market Borrowings

A significant development during the month was the floatation by government of a 10 year security for Rs 1 000 crore at a subsequently floating the same paper again for an amount of Rs 1,709 66 crore towards the end of the month, thus keeping on hold the auction system evolved since June 1992 for implementing the market clearing interest rate mechanism for government securities. Despite the RBI's cajoling of banks not to miss the 14 per cent yield opportunity on the amount of Rs 1 709 66 crore subscriptions worth only Rs 803 61 crore were received the balance of Rs 906 05 crore devolved on the RBI to fill the slack. The argument that it was the policy of the RBI to initially subscribe and then sell it in the market, while it was technically true nevertheless misrepresented the reality. Contrary to the policy of reducing monetised deficit the RBI credit to the government had already reached unprecedented levels. Secondly there was neither a case for nor the possibility of allowing the yield rate on government securities to move up beyond 14 per cent. Hence the RBI will face a dilemma in that while its efforts to sell the freshly issued stock at a price above the face value will not attract buyers as it has actually occurred in June any attempt to sell below par will send wrong signals about its interest rate policy. In the present situation the RBI's policy open market operation with the help of selling even older securities generally stands stymied for the latter reason.

An adverse fall out of the sharp increase in the yield rate on government securities in their primary issues has been the possible depreciation in the banks' current portfolio. Measured by the yardstick of 13 per cent on 10 year stock for valuation purposes ordered by the RBI for 1994-95 the latest rate of 14 per cent – an increase of 100 basis points – results in depreciation and loss of almost Rs 800 crore for banks which has to be provisioned in their quarterly balance sheet. The new RBI guideline for increasing the ratio of current holdings to 40 per cent will further raise the provisioning requirements during 1995 96.

The recent measures such as the raising of the SLR requirement for non banking financial companies (NBFCs) from 10 per cent to 15 per cent beginning June 30 and the requirement for provident and pension funds to invest 25 per cent of their total corpus in central government securities are yet to have their effect on the government security market.

June 21	11	26 00	2	5 00	88 81	12 60

Treasury Bill Auctions

The results of both 91-day and 364-day TB auctions have been characterised by unduly low public response despite gradual increase in cut-off yields to a high of 12 58 per cent and 12 60 per cent, respectively (see also Graph A) Amount mobilised from the open market through 91 day bills was only of the order of Rs 13 crore in June as against the notified amount of Rs 2 500 crore, while in 364-day TBs the amount received was Rs 42 50 crore as against Rs 1,402 31 crore during the corresponding period last year (Tables 1 and 2) The amount devolving on the RBI of 91 day bills during May and June has aggregated Rs 1 242 crore (with no devolvement in April) Under 364 day TBs the gross subscriptions obtained have reached only Rs 254 95 crore as against the redemption during the three month period of as such as Rs 6,317 31 crore in respect of the funds mobilised through this instrument during the first quarter last year

III
Money Market Operations

Call Money Market

The call money market continued to remain firm under the strain of liquidity crunch due to frequent government borrowing and sluggishness in the growth of saving instruments As a result money market rates were constantly perched above the two digit level (Tables 3 and 4 and Graph B)

The first two days in June extended from the non-reporting week beginning May 27 seemed promising for the call market as the rates for overnight money showed some signs of decline The rates came down in this week from 15 16 per cent on May 27 to 10 5 per cent on June 2 Repo deals worth Rs 565 50 crore on May 27 and Rs 263 crore on May 29 done mainly by the DFHI and STCI were largely responsible for bringing the call money rate down The low rates were also attributed to inflow of more than Rs 750 crore through interest payment on government securities and redemption of 91-day TBs on June 2. Moreover, the threat of a strike in the following week given by bank employees had forced banks to cover themselves well in advance

The call market moved in a band of 11-12 per cent during the next reporting week (June 3-9) The reason for the lower levels of rates despite the outflow of funds to the extent of Rs 1,000 crore for government security auction were two-fold One, the market had already accounted for this and had provided for in the previous week and second, repos worth Rs 1,400 crore were done in the last three days of the week thus increasing liquidity in the market

The call money market again firmed up during this non reporting week (June 10 16) with rates hovering around 14 per cent The rates even shot up to 17 17 50 per cent towards the end of the week as Rs 2 000 2 500 crore moved out of the banking system due to advance tax payments Repos worth over Rs 1,100 crore were done to create short term liquidity in the market mostly with the DFHI or the STCI data suggest that the RBI had also pumped in liquidity worth about Rs 200 crore through these institutions on June 15 It was also reported that these institutions entered the call market to borrow on June 14 for facilitating repos

The third week's preoccupation (June 17 23) was the government offer of the 10 year 14 per cent paper worth Rs 1,709 66 crore The call market was extremely tight during this week as the number of lenders started thinning The market opened at 18 19 per cent and reached a high of 21 per cent on June 19 the deals, however, were concluded only at 18 19 per cent A large repo of Rs 223 crore and State Bank's reported presence helped rates come down to a reasonable level of 13 per cent On subsequent days DFHI repos kept the level of call rates at around 15 per cent After the customary 0 25 1 per cent level on the reporting Friday the call rate again flared up to 18 19 per cent on June 24 it remained stubbornly in the range of 15 17 per cent till the end of the month when SBI and UTI were lending at these high rates

Forex Market

Subdued trading except occasional flutters relative stability in the exchange rate and a downward trend in forward premia characterised the forex market operations during the June 1995 (Graph C) Apart from subdued seasonal demand for dollar combined with some augmentation through exports and commercial borrowings, banks were engaged in exploiting arbitrage benefits by selling dollar cash and deploying the rupee proceeds in the call market following rising call rates As a consequence on the eve of the second reporting Friday that is June 22 dollar plunged below the pre budget level of Rs 31 37 to Rs 31 365 for the first time in four months

With the lessening of pressure for outward payments due to decline in foreign currency deposits during the past two months forward premia for the US dollar during May June remained successively lower than in the preceding months (Graph C) Six month forward premium, which was 8 34 per cent on April 17 came down to 7 49 per cent on April 28 to 6 90 per cent on May 31 and to 5 64 per cent towards the close of June

Secondary Market for Government Securities

The severe liquidity crunch and the resultant rising interest rates rendered government securities illiquid the secondary market dormant and the trading closs a risky proposition When traded almost all securities were sold below par the longer the maturity and the lower the coupon rate the larger the loss from par value For example on June 23 11 5 per cent government stock 2008 was traded at Rs 87 19 (YTM = 13 58 per cent) and 9 per cent 2013 at Rs 79 19 (YTM = 11 82 per cent) But on June 27 10 5 per cent 2005 was traded at Rs 81 52 (YTM = 14 per cent) There were a few high coupon bonds traded at marginally above par This reflects the concentration of investors interest at the shorter end of maturity spectrum as the two most traded securities were 12 per

cent 1995 and 12.75 per cent 1996 converted government stocks

Repo

A healthy development in the money market was seen in terms of increased repo deals during the month mainly as a hedge against persistently high call rates. Both DFHI and STCI were very active in the repo market where a total repo deals of Rs 5,274 crore were transacted in June which was higher than the previous two months' repo deals (Appendix Table). Besides the high call rates, the rising yield structure also prompted the operators to do repos to use the money to buy government bills and securities while prices had fallen. These were also rollover of some repos, reflecting attempts by investors to ride the yield curve.

An interesting development in the repo market relates to the initiation of the repo transactions on the NSE screen on June 24, as explained earlier.

Yield Curves

As is evident from the above paragraphs, during June the yield curves for the government paper have been generally inverted. On a single day on which maximum number of securities transactions took place (June 28), 364-day TBs were traded with YTMs ranging from 15.06 per cent to 14.18 per cent but the four government securities traded on that day had YTMs moving upwards with ascending order of maturity (Graph D). The average picture for the last week of June shows zig-zag movements of YTMs, but generally showing a flat yield curve (Graph E). But the flatness of the curve stands out when weighted averages of YTMs are considered for all the five weeks of June together (Graph F).

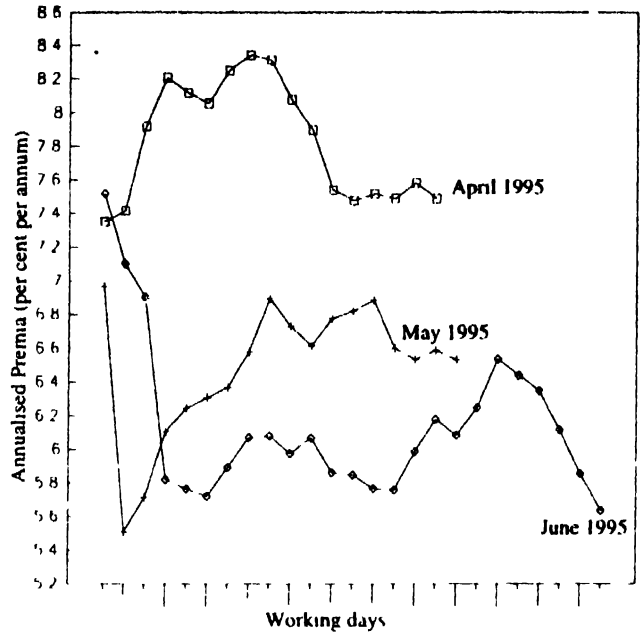
The public sector undertakings (PSUs) have been quite active on the bonds market for the past couple of years. With the government virtually stopping the contributions made by it to the PSUs, the PSUs have to approach the market to meet their needs for funds. Total stock of PSU bonds market at the end of March 1995 was of the order of Rs 40,000 crore. Also, at a time when the government itself is the largest borrower and liquidity in the system very low, the PSUs have little choice but to pay a very high rate of interest. All of their bonds are currently being privately placed with banks as bulk investors. While the fresh stock of taxable bonds is being issued at 16.25-16.50 per cent, in the secondary market, the rates are even higher at 16-18.30 per cent. PSUs such as Hydel Power Corporation were also reported to be inviting bids for a bond issue of Rs 100 to Rs 200 crore. NTPC, IFCI, and NHPC had also expressed intentions of raising funds through taxable bonds in the range of 15.5-16 per cent. The market however did not come forth immediately to invest in these issues and the issuers were essentially wanting to test the market.

PSU Bonds

However two primary issues of PSU bonds which have dominated the market for some days now are from IFCI and NPC. IFCI issued a 14.5 per cent two-year bond worth of Rs 200 crore which was subscribed up to only Rs 60 crore, while the NPC's five year [illegible] per [illegible] oversubscribed to the tune of Rs 60 crore. The failure of IFCI issue reflects, despite its offering a front-end discount and graded redemption premium, the market's appetite for a much higher return as the yield on government securities had gone beyond 14 per cent in the secondary market and for PSU bonds (taxable), beyond 18 per cent. In order to attract lonable funds, PSUs are also found providing various incentives, though they are generally plain vanilla issues (regular fixed coupon bonds with pre-determined maturity), they offer front-end discounts, graded redemption premia and generally put and call options.

In the secondary market, the trading volume picked up sizeably compared to earlier months, with tax free bonds being sought after by investors. While the supply of tax-free bonds were absorbed by the market the taxable bonds suffered from selling pressure and a majority of deals passed through at increased interest rates of 16.5 per cent to 18.3 per cent.

Commercial Paper



The month of June witnessed considerable revival in the CP market – primary as well as secondary. Besides the corporate borrowers, the NBFCs with the banks acting as conduit have emerged as active issuers in the primary CP market, as the former earn a spread of 10 per cent in their lending activities in consumer finance and also to take advantage of the anomaly of stamp duty structure in Maharashtra, CPs placed with banks carry a stamp duty of 0.05 per cent which

increases by five times to 0.25 per cent if placed with 'other than banks'. Banks encourage the placement of CPs of shorter maturities and offload these CPs in the secondary market at attractive prices, mainly to escape the provision of capital adequacy norm while simultaneously earning a reasonable spread over and above the 12-13 per cent call money rates. Further, the factors like liquidity scarcity, delinking of cash credit limit, alongwith banks' reluctance in reviewing cash credit limit have propelled the corporates to rely on CP. As a result, their rates of interest are found to have shot up sharply. For instance, Jain Irrigation raised Rs 15 crore at 15.5 per cent, Arvind Mills Rs 15 crore at 15 10 per cent, and Kotak Mahindra Finance Rs 15 crore at 16 5 per cent and again at 17.25 per cent towards the end of June.

In the secondary market, the trading volume in CP leap-frogged substantially during the month At the National Stock Exchange which accounts for about one-third of total secondary trading in CP, the trading volume increased to Rs 84 crore in June – more than the total trading volume of the preceding three months. Further, contrary to the earlier trend of selling pressure dominating the demand, the month under reviewed experienced demand outstripping supply of CP (Table 5)

NCDs

Apart from CP, many big-size corporates like Videocon having investment projects under implementation prefer not to tie themselves up with high-cost long-term borrowings from term-financing institutions on the perception that the present rates of interest for such borrowings are unduly high and that they would come down. Instead they offer non-convertible debentures for short-term durations of

UTTAR PRADESH

BJP's Moves under Cover of BSP Government

Amaresh Misra

The BJP is trying to instigate 'low intensity' sectarian conflicts, especially between the backward castes and Muslims

AS expected, Mayavati was able to prove her majority on the floor of the UP assembly, after all the high drama involving the speaker and the governor which saw constitutional procedures and norms being sacrificed once again at the altar of political expediency In UP a clear cut battle of interests is going on The row between the governor and the speaker was no exception it was a fight between two parties pushing their partisan interests In the political equations now prevailing the Congress has developed an interest in keeping Mulayam Singh out of power which means ensuring at least for the time being the survival of the BSP chief minister Hence the extraordinary role played by the governor in personally ensuring that the proceedings of the assembly moved in a certain direction

The show of strength itself passed off without much tension with Mulayam Singh boycotting the proceedings and walking off with a majority of his legislators a splinter SP group voting for Mayavati and the Congress abstaining There was a split in the Janata Dal also V P Singh's attitude all through was to keep equidistance from the warring camps while showing softness towards the dalit chief minister The JD state chief was expelled from the party for following one side of the V P Singh line Mulayam Singh was worsted as he was not able to present himself as a victim of either parliamentary manipulation or an unholy political alliance He failed to make a substantial public issue out of the recent happenings His efforts are revolving solely around power politics and here he is getting increasingly marginalised His response to the defeat in the legislature was a delegation to the president in Delhi and his response to the crackdown on his supporters by the chief minister was a meek protest At a time when scores of SP supporters are being made a direct target through a personal campaign by Mayavati, Mulayam is failing consistently to highlight any pressing issue that can go against the government Among the people at large his regime is still seen as one of repression and goonda raj because of which there is apathy even in sympathetic quarters

It is quite clear that any re-emergence of Mulayam Singh is unlikely to take place on the old planks of backward castes and power politics After more than a year of the Mulayam regime and the going over of the BSP to the BJP dalit OBC politics stands severally impaired Even more importantly the very political tactics' which had projected the capture of political power by the lower castes as a means of a new electoral combination capable of replacing the traditional parties has lost its potency Caste became during the SP BSP regime, a byword for mafia raj and a means for the upward mobility of criminals and the neo rich from within the backward castes and dalits These new power groups were from the beginning ill equipped to fight communalism or measures like the Congress-sponsored NEP Politically they were opportunists wanting a share in power and ideologically they were true neo brahmins interested in supplementing their identity with renewed sectarian appeals and tendencies prone to an alliance with brahminical forces and the BJP Mulayam himself had gone on a spree of declaring himself to be a Sanatani Hindu and touching the feet of brahmins during his chief ministership The neo brahminical turn of the BSP came as a culmination of a process which exposed its true class and ideological character as also the fact that the backward power groups were now integrated within the established brahminical power structure and could not be relied upon to combat communalism The option before Mulayam Singh therefore is to reconsider his political tactics even if only to win back lost initiatives

Before the present regime however containment of Mulayam Singh is the main agenda and this uniting factor is at present overriding all other considerations Differences between the BSP and BJP have come to the fore over the recent proposal of the Mayavati government aimed at granting 10-15 per cent reservation to the Muslims in the state The BSP had raised this demand previously also, but its revival came at a time when there was a widespread perception about the BSP working under the direction of the BJP Its timing appeared to be meant more to take the pro-BJP focus away from the BSP The move was followed by VHP and BJP issuing statements opposing the move The controversy suits the BJP as much as it does the BSP, as it also serves to take the pro-BSP focus away from BJP and calm down the anxiety of its supporters The friction is operating through a tacit understanding between the two parties since both stand to gain There is more at present that is actually uniting the combine the campaign against the SP has only just gathered momentum the hold over the administration is as yet tenuous and both parties have yet to consolidate the gains they have made through the capture of power Any government instability will be counterproductive to their interests besides helping Mulayam Singh

The issue of reservations for Muslims has been in the news for sometime now and the lines drawn over it reveal some pointed features The BSP has been most vociferous about it yet it has consistently ignored demands to implement what is immediately possible within the sphere of the UP government viz special reservation within the stipulated 27 per cent to 7 8 per cent of backward Muslims This has been the consistent demand of progressive Muslim organisations like the All India Muslim Forum who have pointed out that any general reservation policy for the Muslims will be counter productive to its backward sections who remain probably the most neglected and isolated sections amongst all Organisations like the CPI (ML) too supported this demand and asked the BSP to prove its honesty by implementing first the quota for Muslim backwards Apart from the All India Muslim Forum other more traditional Muslim organisations have not been vocal in the controversy as it introduces a different debate from the accepted conventions of old style Muslim issues But since then under the heat generated over the issue BSP leader Kanshiram finally announced the implementation of 8 44 per cent reservations for backward Muslims within the Mandal quota with the rider that the issue of general reservation was a difficult one because of the Supreme Court limit on reservations

But for all its high profile, the Mayavati government seems to lack confidence Any new government which comes to power has at least a general policy package to which it pays lip service The present one, by contrast is distinguished by the fact that it has failed to announce any programme till date Much noise has been made about crackdown on the mafia forces but there has been little real action There is an effort to organise Yadav-Gujar rallies with the tacit help of some shady elements from within these communities, in order to win over the backwards The government is working on an *ad hoc* basis and seems

intent on scoring political points over rivals and somehow increasing the range of support for the BSP What is more, in recent pronouncements any mention of dalits has been singularly missing, instead the BSP recently made much out of the fact that it is now considering giving seats and tickets to upper caste politicians

The alienation of the dalits from the BSP is beginning to unfold in different ways The poor amongst them are getting increasingly restless and unconvinced about a dalit government being in office Recently in an apparent move to assuage disaffection, Mayavati gave some assurances regarding the grant of land to dalits Seizing upon this, the CPI(ML) organised a number of demonstrations in Benaras to demand transfer of land rights and actual possession of land to poor and landless dalits These demonstrations however were cracked down upon and the administration resorted to lathi charges and a large number of arrests The incident received widespread coverage all over east UP and the support of the rural poor for whom the issue has become a live one The CPI(ML) has also planned an overall programme of raising this issue in order to channel the aspirations of the dalits along radical lines and effect a movement of the rural poor who have arisen as a new class force in the countryside. Such assertiveness on the part of the rural poor was also discerned by a recent survey conducted by the CPI(ML)'s student wing the AISA in the state scountryside It was found that contrary to the prognostications of the end of the land question especially after the rise of the intermediate caste factor in politics it is still the main issue in the countryside Vast tracts of land are held by landlords feudal practices like paying abysmal wages of Rs 2 and 1/2 kg of 'sattu' are rampant usury is practised on a wide scale and social respectability for the dalits is a chimera The survey outlined the rise of the rural poor as a class force in its own right coupled with the rise of a neo rich peasant class from within the backward castes The CPI(ML) has announced a peasant conference on a big scale in October It also organised a 20 day exposure campaign aimed at the BJP BSP regime to press home the need for a genuine left democratic alternative to fill the present political vacuum against the backdrop of the renewed threat of a BJP comeback

The feeling that a vacuum is persisting despite the new government in office is also due to the continuance of the anarchy of the Mulayam Singh days It is finding an outlet in various directions but of late a disturbing feature has emerged in the form of a number of incidents with a communal tone A communal riot masterminded by the RSS and aimed at splitting the backwards from the Muslims occurred at Phulpur, Allahabad in the 1st week of June which left scores dead and injur government remained mute spectators while Muslims were harassed and Yadavs were incited over a trifle matter The SP played into the hands of the RSS by fanning the issue and ultimately going on the defensive In another incident at Kunda Pratapgarh, a brutal mass attack on Muslim homes took place under the direct tutelage of a local independent upper caste MLA ideologically close to the BJP In the incident, which was part of a vendatta by some local supporters of the MLA against some Muslim youths, more than 20 houses were burnt down completely and the rioters looted everything For a whole day there was no action from the police Afterwards four bodies of women victims were found floating in the Ganges There has been minister of the BSP has visited the and the compensation offered has been meagre

Indeed, these incidents reflect a pattern of feudal-reactionary forces increasing their assertiveness There are reports that elsewhere also the BJP is trying to instigate 'low-intensity' sectarian conflicts, especially between the backwards and the Muslims There are also fears of riots and violence and in all this it is clear that the BJP is subtly pushing forward its agenda under the cover of the new government The BSP may be thinking of deriving some benefit by appearing as the protector of Muslims and dividing the backwards, but under its rule the state is moving towards a fresh outbreak of communal tension

Under the Guise of Women's Empowerment

Fate of Rajasthan's Sathins

Gautam Navlakha

The recent decision to phase out the Women's Development Programme in Rajasthan is in a way a sign of the state's recognition of the enormous potential of women's empowerment to challenge entrenched power structures.

THE struggle of the 'sathins' (village level workers of the Women's Development Programme) in Rajasthan for better working conditions and salaries is a comment on how the class and gender bias embedded in a programme surface from underneath the veneer of hyperbole And they bring to mind what Marx once said about Luther that he "overcame the bondage of piety by rep-lacing it by the bondage of conviction He shattered faith in authority because he restored the authority of faith" So long as the sathins weakened the local authority words like 'empower', 'equality', 'sisterhood', 'solidarity' did not acquire their full import No sooner they began to interrogate their role in the WDP they discovered that their defiance was considered a threat to the authority of the government

The 'non-formal' post of sathin was created in the six districts of the state in 1984 when it was felt that grass roots activist was needed to look after the welfare of women in villages WDP had as its principal aim to ' empower women to recognise and improve their social and economic status" The expansion of the programme by the government in 1990 in no way changed the inherent nature of employer-employee relationship Therefore when the women workers protested, organised and began their struggle for decent and fair compensation for their work and security the officials did everything possible to quell it Failing this they decided to 'phase out' the institution of sathins itself

The department of Women and Child Welfare at a meeting held on January 1, 1995 took decisions which were to be conveyed to the Steering Committee It was decided that honorarium being given to sathins should now be given to the Mahila Samooh (women's cluster), that an age limit be fixed for sathins, and that those women who have completed five years of work as sathins should be 'phased out' The minutes of the meeting says that "were all sathins to be phased out at one go it would create problems Therefore at a time hundred sathins should be phased out and that in this connection separate orders are being issued". In fact the minutes suggest that a decision had already been taken on November 4, 1994

Sathins were supposed to look after gram (village) panchayat (at places a gram panchayat covered four to six villages) motivating people for literacy campaigns, against child marriage, dowry and drug addiction, encouraging women's participation in activities such as agricultural extension programme, installation and repairs of handpumps, immunisation, working against violence on women, helping in revenue and administration camps, rural housing schemes, family planning, implementation of PDS, payment of minimum wages, etc, and for which they were entitled to a meagre monthly honorarium of Rs 200 which was increased to Rs 250 in 1988 At this early phase of the programme argument was that were the sathins to be paid wages/salaries the work would get defined by someone else and the relationship between the officers and the women workers would become that of master and servant Therefore what was needed is flexibility and letting the sathins decide the kind of work they want to do, issues to be raised, and how to raise them This ostensible 'openness' thus became a noose around the neck of the women workers since they were neither entitled to minimum wages, service conditions according to procedures laid down by law, nor protection as government servants when faced with intimidation, harassment including physical attacks

Officials now argue that since each district has roughly 1,000 villages and that sathin-based programme can only reach 100 or so it is necessary that benefits under WDP also reach the rest It never occurred to the authorities that if they were concerned about the villages not covered by WDP then they ought to have worked towards expanding the programme with increased budgetary allocations

The decision is to move sathins every five years to another village In addition it is said that in villages there should be a Mahila Samooh, (women's cluster) of five women and sathin's job should rotate between them each year The target-oriented approach becomes evident from their insistence that sathins cannot be 'illiterate' whereas the WDP programme plan had talked of employing even 'illiterate' women if literate workers could not be found At a meeting held on April 10 the director of WDP told sathins that five years was sufficient for development work in a village In any case, he said that they were neither permanent employees nor government servants. In a convoluted to be dependant on the government.

On April 17 sathins held a dharna in front of the assembly. The minister for women and child welfare, Narendra Kanwar, director J C Mohanty and other officials consented to meet them When asked whether the government had taken a decision to do away with the post of sathins they denied any such decision since there is no post of sathins, and women workers are volunteers However, when union leaders were explaining why doing away with the post of sathins would be detrimental for women especially now when for the first time large numbers of women stood for and won panchayat elections. The minister is reported to have said that sathins cannot occupy two posts. When pointed out if this meant that there is such thing as a post of sathin there was silence The minister was nonetheless of the opinion that older and illiterate women cannot be kept as sathins and that sathins should teach stitching, making papads, opening accounts and helping with FP Facing a brickwall of evasion sathins decided to sit in a dharna until the CM agreed to see them The initial reaction of the CM was to claim that he was far too busy to meet anyone Thus for the first time women sat through on a night long dharna in the front of the assembly Since this could prove to be politically embarrassing the CM then sent a message that he would see them next morning, on April 18 When the sathins entered his chamber he was speaking on the telephone enquiring about the file on sathin and trying to find out what were the issues He then told them that he would look into the matter and had asked for the file suggesting that there was no need for any further discussion What the CM forgot was that this was not the first time he had taken recourse to such a strategem The sathins pointedly told him that in March 1990 and subsequently in April 1994 he had seen them and assured them that he would call for the files Since nothing had happened and now they faced the threat of losing their jobs they could no longer believe him They wanted to know that if the government had decided to do away with the post of sathins then why were they given the assurance on March 8 by the WDP officials that the government had agreed to increase their honorarium from Rs 250 to Rs 500 per month. Some of the sathins told him that they had been BJP supporters and had expected him to be sympathetic He promptly said "of course I will help you" They angrily told him that they wanted no special favour and that he should do something for all the sathins There the matter stands

The Programme

Sathins under the WDP have so far existed in a twilight zone of being and yet not being government employees. The nature of their work makes them the grass roots level worker co-ordinating various development work of

the government especially those related to women and children (mainly female child) This formal institutional arrangement was based on the assumption that public funds are meant to be used for public benefit

Lest we forget as late as mid 1980s the centre of gravity had not shifted to link the rolling back of government to cutting down welfare expenditure Since such is the current fad providing sathins the benefits as government employees is not just unattractive it is less accountable being non formal and at the mercy of contingent benevolence of well meaning persons

The WDP Project proposal (Department of Rural Development and Panchayati Raj Government of Rajasthan May 1984) could thus unblushingly pitch the programme at a high note

> It does not require much sensitivity to realise the apathy and injustice to which women are subjected They have to learn the harsh facts of life without the opportunity for schooling they work without being recognised as workers and throughout life they are expected to follow the commands of men the father the husband and son (p 18)

How was this to be broken? It was said that Development is a motion which demands a qualitative shift in the attitudes of the people involved to generate experience which facilitate altered perceptions of the self in our collective strength faith in solidarity and sisterhood born of sharing all those moments of personal pain humiliation the years of silent suffering and moments of happiness (and) positive perception of a women's own identity in a larger social process * And therefore WDP was seen as a three tier relation a structure which will have the inner strength and grass roots linkage of voluntarism the security and stability of government and a continuous incorporation of critical reflection from research bodies

The very formulation provides an insight into current conflict Because 'altered perceptions are to be achieved operationally by a structure in which actual work was to be undertaken by the sathins although they were not expected to play any role in influencing the larger social process nor was it even conceived that these women workers could also provide critical reflection This was a task reserved for the employers

And yet the 'principal aim of the WDP is to empower women Within this overarching objective the specific aims were amongst other things said to be 'to identify programmes and to create mechanisms for conveying these programmes for the benefit of women" "to ensure a clear focus on families from poverty groups and on women who have suffered disabilities due to social oppression and physical disadvantage 'child welfare is inseparable from women's development" "to create a machinery which will evaluate, support and animate the base level centres and will secure the support of various government agencies, credit institutions, voluntary agencies, etc"

Significantly WDP was "not intended to take over the responsibility of implementing these programmes (which aim at ameliorating women's problems)", but to "improve women's participation in these programmes and effectively monitor the extent to which benefits actually accrue to women" As a result it was clearly felt that rigid and excessively defined functions can hamstring the workers'

However an evaluation of the work of sathins for 10 years from 1984-85 to 1994 95 is in form of achievement of 45 items, as though the sathins were supposed to be responsible for implementing government programmes There was no attempt to undertake an objective non target oriented work evaluation in accordance with the objective and aims of the WDP The attempt was to downplay the objectives and to elevate targets in order that the work of these organised women workers would appear in poor light For instance a report of a meeting held on February 13 of the district WDP Jaipur brings out the shift in perspective and nature of working when it says that in Jaipur district 18 000 bank accounts must be opened and sets a target of 2,000 bank account for each Pracheta (supervisor) The same report also shows a commandist approach typical for bureaucratis in connection with anti child marriage campaign when it is stated that in the child marriage prohibition campaign three jeeps would be employed with three prachetas scout guide boys and girls who still stand and shout slogans put up posters in villages and write slogans

That there is an element of coercion even in the beginning was clear from another instance The district WDP Ajmer for instance issued an order to prachetas on March 15 1991 that stated regarding family planning that you must ensure together with your sathins that the targets laid down in the national programme (for FP) are fulfilled or else we would be compelled to take strict action against you" (translated from Hindi)

This shift in the WDP programme became more pronounced in the late 1980s with emphasis being not on grass roots issue but implementation of government schemes Performance began to be judged in the form of tangible results especially to fulfil population control targets The pressure was put on the pracheta (supervisor) who was incharge of 10 centres each headed by a sathin to provide results

It was the prachetas who took the first lead in forming an union The process of unionisation for sathins began in March 1990 when demand for an increase in honorarium was raised Until then they were receiving an amount of Rs 200 But their demand led to an increase of Rs 50 per month Since this was an act of tokenism by authorities it did not take long before trouble erupted In December 1990 sathins from Kekri, Ajmer district formed a women's group called Kekri Mahila Samooh (Ironically WDP had objected to formation of KMS in 1990 as undermining the work of sathins only to demand that by 1994-95 that sathins should be replaced by mahila samooh) Their participation in a women's conference at Calicut was objected to by the WDP authorities and led to dismissal of five of them They decided to move the court Meanwhile for the first time idea was mooted for forming an union However, the authorities decided to crush this nascent effort by forcing many of the sathins to sign a written statement that they would not unionise This delayed but could not stop the moves for forming an union which was finally registered in January 1993

The union has 200 formal members but nearly 500 are actively associated although they do not or rather cannot afford to pay union fees The union is spread over 22 districts Union activists say that until recently there used to be district level meetings between the sathins working in one district with the prachetas After the meetings sathins used to discuss their common concerns and collective activities Officials who never tired of mouthing words like empowerment and participation took offence at union work of the sathins and prachetas In order to obstruct union work and collective action by sathins such monthly district level meetings of all sathins has been discontinued and groups of five seven are now called

So great has been the opposition to sathins forming union that in Ajmer district the project director sent letters to the husbands of sathins warning them that if their wives were to go for union meetings then officials could not be held responsible if something were to happen And they stressed that no sathin should be sent outside the villages unless they received officially sealed letters requesting their presence

The 11 point demand of the Sathin Union relates primarily to recognising them either as government employees or as industrial workers entitled to minimum wages and other perquisites accordingly – security of tenure, protection against violence against them etc Instead of meeting these demands officials of WDP took recourse to subterfuge Officials told sathins on March 8 at a Women's Day programme in Jaipur that they would soon get Rs 500 salary They had already taken a decision in January to phase out sathins by restricting their terms to five years and giving the amount given to sathins to the mahila mandals for them to spend collectively Such underhand methods were also the experience of sathins when they protested against rape, molestation etc For instance when sathin Bhanwari Bai of Bhateri village in Jaipur was raped because of her campaign against child marriage, the authorities not only refused to prosecute the men but tried to purchase her silence by offering money No action was taken against the panchayat member who attempted to

rape sathin Manju in Mahendragarh village The threat to kill sathin Etaasi in Ajmer for raising the issue of attempted rape of a woman in the village did not see the authorities take any action against the men Instead it was claimed that the role of sathins had become controversial' A case was cited of leaders of 39 panchayats in Bassi block of Jaipur district who had resolved not to co operate with the sathins until one of them Bhanwari Devi withdrew her allegations It was also claimed that since WDP had envisaged voluntary participation and avoided creation of government employees the very objective of the programme would be lost were it to accede to their demands Although the reality of a government funded programme meant to empower women only to end up exploiting the women workers is completely lost on them

When five sathins and a pracheta were dismissed from services in 1990 following their participation in the Calicut Women s conference the argument advanced was that they could not do so without the approval of the WDP authorities The dismissed women then approached the Rajasthan High Court for reinstatement (SB Civil Writ petition No 2901/91 in the high court bench of Judicature for Rajasthan at Jaipur) On March 10 1992 the high court in their judgment pointed out that they are carrying out the programme organised by the government and is (sic!) working as a village level worker Mahila Vikas Kendra are run by the government for the people and under the overall supervision of the collector of the district under the guidance of the department of rural development and panchayati raj government of Rajasthan It is true that no service rules have been framed for sathins Having worked for more than five years petitioners services cannot be terminated just by a stroke of pen without observing the principles of natural justice" The court also ordered that they be ' taken back on duty immediately But such is the disregard for judiciary the authorities three years after this judgment have yet not complied Interestingly, sathins were until 1990 chosen by the gram panchayat And village women workers who were dismissed from their jobs received support from the gram panchayat who pointed out that if they were consulted and their choice was accepted for appointment of sathins they ought to have been consulted regarding their dismissal Again instead of rejoicing at this awareness of democratic principle sathins were not appointed in new districts instead cluster approach was tried out and honorarium given to sathins was provided to the cluster

Continued Relevance of Sathins

It is also clear from the assessment of actual need that if anything, the crucial importance of sathins has not declined A foreword for a proposed work programme prepared by the district WDP, Ajmer for April 1995-March 1996 states as a matter of fact "Since women s involvement in the 1995 panchayat elections and formation of new panchayats, panchayat committees and district councils has increased it has meant that the responsibility of WDP too has increased and with that the area and possibilities of work If this assessment is correct then rather than shuffling and phasing out sathins or moving them once in every five years there is need for enhancing the budgetary allocation so that more gram panchayats are brought under the scheme

As employer WDP had certain responsibility for protection and welfare of the women workers The sathin is the contact person for all government departments payments come from the government and their appointment letters are issued by the government Each sathin has had to fight with her family kinship group village, and it has taken them years to acquire social acceptance and credibility For instance, social custom laid down that lower caste women could not wear shoes and walk through the village Besides women were not permitted anywhere close to the panchayat and had to accept whatever decision that were taken Government support helped in enabling them to challenge local authority In several districts sathins have succeeded in motivating women to contest panchayat elections And now just when these women are all set to take their struggle to a new forum they are being phased out

To persist year after year with their work for which they received a pittance and face all kinds of opposition meant tremendous commitment and willingness to take risk Ironically the very fact of their interrogation of social conditions within which they worked and their rebellion against the WDP authority is born out of their involvement in the developmental work itself If the WDP authorities had any sincere commitment to the objective of empowering women then rather than phase out this programme they ought to work for its enhancement and appreciate the success of the work undertaken by the sathins

Sathins were supposed to retain a critical involvement in government programmes They were not expected to merely accept programmes but also to raise issues thereby facilitating the participation of village women and ensuring that benefits meant for them were not frittered away This is best illustrated by the manner in which the family planning programme was treated by the sathins WDP did not oppose FP but insisted that it should follow WHO norms and not set targets to be achieved WDP also opposed any effort to compel women to accept FP in order to avail of any emergency relief work In 1987-88 as part of famine relief, employment was provided for women but this was linked to women accepting FP Sathins succeeded in mobilising women and others against this and insisted that proper procedures must be followed They were accused of being anti-national since they were opposing a programme of vital importance for the nation But with WDP now becoming an integral part of FP with questioning of the programme is not permitted and sathins are seen as vehicle for fulfilling government targets

Another issue where targets are set and meant to be followed is Mahila Samriddhi Yojna under which if women deposit Rs 300 every year they are for receive Rs 375 at the end of the year There are targets set for the number of such accounts which must be opened If these targets are not met explanations are called for Sathins have protested against this pointing out the inability of poor village women to make lump sum payment of even Rs 300 and the fact that banks do not accept deposits of Rs 25 per month If a mindless officialdom insists on carrying on the chances are that this scheme will fail Again sathins have been involved with famine relief payment which is made according to measurement of area dug and quality of earth There is enough scope for corruption Sathins succeeded in their areas in ensuring that measurement norms were properly followed and complied with

In a climate where government expenditure on law and order and military continues to expand and where rolling back of government has meant cutbacks in social welfare allocations development is increasingly being seen as allowing people to be left to their own devices It is then an issue between callous government and grass roots activities No sooner one threatens or questions those in power everything is done to bring them to submission Since current wisdom equates good governance with less governance cutting down on social welfare allocations acquires an ideological sanctity This is also evident from the struggle of the aganwadi workers agitating against the move of the government to privatise the Integrated Community Development Scheme By jeopardising the scheme itself the focus of aganwadi workers has been shifted from better working conditions to saving their jobs

Notes

[This draws heavily from the work undertaken by women s groups in Delhi especially the untiring efforts of Saheli and the report mentioned above But I am especially indebted to Aarti and Kiran of the Sathin Union for sparing so much time in the midst of their struggle and to Vrinda Grover for all her help including comments Needless to add I alone am responsible for the (mis)selection and (mis)interpretation of facts]

* This was stated in a document entitled , *Exploring Possibilities A Review of the Women s Development Programme Rajasthan* and loc cit in *Development for Whom? A Critique of Women s Development Programmes* October 1991 This is a joint report by women s groups from Bombay and Delhi

BOMBAY BRANCH

Schedule 17—Notes forming part of the accounts for the year ended 31st March, 1995

Principal Accounting Policies

1 General

The accompanying financial statements have been prepared on historical cost basis and conform to the statutory provisions and practices prevailing in the country

2 a) Revenue Recognition

Items of income are accounted for on accrual basis

Expenditure are accounted for on cash basis except for Interest Payable, Bonus, Ex gratia, Rent and Audit fees

2 b) Net Profit

The net profit disclosed in the Profit and Loss Account is after

i) Payments for Interest tax and Income tax, which are in accordance with the Statutory requirements and considering the articles of the Double Taxation Agreement between India and Japan The income tax paid during the year is debited to Profit and Loss Account and the refund of Income tax is considered as income in the year of completion of assessment under section 143(3) of the Income Tax Act, 1961

ii) Provisions for doubtful advances

iii) Other usual and necessary provisions

2 c) Head Office Administrative Expenses

The branch has not debited Head Office Administrative expenditure to its Profit and Loss Account but has claimed the same for tax purposes

3 Transactions involving Foreign Exchange

i) Monetary assets and liabilities except Foreign Currency Non Resident Account balances (which are stated at the rates specified by the Reserve Bank of India), are translated at exchange rates which are the average of T T buying and selling rates as at the close of the year, called the middle rates as per head office instructions However the Profit/Loss on the translations of the Monetary Assets and Liabilities is recognised on the basis of exchange rates prevailing at the close of the year as prescribed by FEDAI The difference between the valuation as per closing rates and middle rates is reflected in current assets/current liabilities and has no impact on the Profit and Loss Account of the year

ii) Income and Expenditure items are translated at the exchange rates ruling on the dates of the transactions

iii) In terms of FEDAI circular Profit or Loss on outstanding forward contracts has been accounted for

iv) Contingent Liabilities in respect of letter of credit issued in foreign currency are stated at middle rates' as explained in (i) above and outstanding forward contracts are stated at the contracted rates

4 Investments

Investments are bifurcated into permanent and current in the terms of Reserve Bank of India guidelines Permanent investments include securities intended to be held on long term basis or till maturity as the case may be The investments are valued as per the guidelines laid down by Reserve Bank of India as under

i) Permanent investments are valued at cost

ii) Current investments have been valued at lower of cost or market value, scrip wise under each category and the depreciation/appreciation in each category has been aggregated Net depreciation if any is provided for and net appreciation, if any, is ignored For the purpose of considering the market value, Stock Exchange quotations wherever available have been taken and where the investments are not quoted on the Stock Exchange, the same have been valued as per the norms laid down by Reserve Bank of India as under

a) PSU Bonds – Valued on yield to maturity (YTM) basis

b) Treasury Bills – Valued at carrying cost

5 Advances

i) Provision for advances is based on the classification into "Performing" and "Non Perofrming" assets in accordance with Reserve Bank of India guidelines

Provision for non-performing advances is made as under

Sub standard Advances	10%
Doubtful Advances	100% of the unsecured portion and 20% to 50% of the secured portion depending on the period for which the asset has remained non performing
Loss Advances	100%

The provisions so required by the Bank have been made after considering the provisions existing in the books of the bank as at the end of the previous year

ii) The bank has not credited interest on advances classified as non-performing to its income taking into consideration the guidelines issued by the Reserve Bank of India in this respect

iii) Provision in respect of doubtful advances have been made on gross basis without considering tax relief

iv) Advances are stated net of bills of exchange rediscounted and provisions in respect of doubtful advances

6 Fixed Assets

i) Premises are stated at historical cost Other Fixed Assets are stated at original cost of acquisition including taxes, duties, freight and other incidental expenses related to acquisition and installation of the concerned asset

ii) Fixed assets are depreciated on the Reducing Balance method at rates as determined by the Management The rates of depreciation applied are higher than those prescribed in Schedule XIV of the Companies Act, 1956 except for computers for which the rate used is 36.9%

iii) Depreciation on assets acquired during the year is provided on *pro rata* basis from the month of acquisition, however no depreciation is provided on the assets sold during the year

7 Staff benefits

i) Gratuity and Superannuation Benefits

The Branch has availed of Group Gratuity Scheme with Life Insurance Corporation of India in respect of payment of gratuity to all employees other than expatriate employees and has also availed of Employees' Group Superannuation Scheme for providing pension benefits to its officers, other than expatriate officers

ii) The amount of bonus payable to its employees as per Payment of Bonus Act, 1965 and ex-gratia is fully provided for and charged to the Profit and Loss Account

THE SAKURA BANK, LIMITED

(Formerly known as THE MITSUI TAIYO KOBE BANK, LIMITED)

(Incorporated in Japan with Limited Liability)

BOMBAY BRANCH

Notes forming part of the Accounts

1. Investments are classified as under

	Current Year (Rs in Thousands)	Previous Year (Rs in Thousands)
Permanent Investments	21,000	21,000
Current Investments	1,136,657	952,432
	1,157,657	973,432

2. The impact of the Report of special audit of Foreign Currency Non Resident Deposit Scheme A (FCNRA) transactions ordered by Reserve Bank of India for the period 1st April, 1990 to 31st March, 1994 is not considered in the accounts pending scrutiny of the report by the Bank and receipt of further instructions from Reserve Bank of India.
3. Fixed assets do not include assets received at no cost from the Head Office
4. The accounting policy relating to rent paid has been modified from cash basis to accrual basis due to which rent paid is lower and Profit is higher by Rs 17,666,363
5. Previous year's figures have been regrouped/rearranged, wherever necessary

Dated: 3 July, 1995

Auditors' Report on the Bombay Branch of The Sakura Bank, Limited under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Bombay Branch of The Sakura Bank, Limited (formerly The Mitsui Taiyo Kobe Bank, Limited) as at 31st March, 1995 signed by us under reference to this report and the relative Profit and Loss Account of the Bombay Branch of the Bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account together with the notes attached thereto are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

1. We have obtained all information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and found them to be satisfactory,
2. The transactions which have come to our notice have been, in our opinion, generally within the powers of the Bombay Branch of the Bank;
3. In our opinion, proper books of accounts as required by law have been kept by the Bombay Branch of the Bank so far as appears from our examination of these books;
4. The above mentioned Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account;
5. In our opinion, and to the best of our information and according to the explanations given to us, subject to:
   The impact of the Report of special audit on Foreign Currency Non-Resident Deposit Scheme A transactions as referred to in Note No. 2 of Notes to Accounts having not been considered in the accounts,
   The Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at 31st March, 1995 and in case of Profit and Loss Account gives a true and fair view of the profit of the Bombay Branch of the Bank for the year ended on that date.

Relief Assistance and Rehabilitation

Lessons in Disaster Management

S Parasuraman

In order to keep track of hazard prone sites and to co-ordinate relief and rehabilitation work, it is urgent to evolve structures to effectively manage disasters

THE Osmanabad Latur (Maharashtra) earthquake of September 30 1993 ravaged over 70 villages and reduced most of them to piles of stone and rubble It left 8,311 persons dead and 9 032 persons injured (TISS Survey, 1993) The government and the NGOs have done commendable work in relief operations Continued collaboration of the government departments and NGOs, and enhanced participation of the community, are crucial for the successful implementation of the programme for reconstruction and rehabilitation

The Maharashtra government and a number of donor agencies and NGOs have started the work of reconstruction and rehabilitation Many organisations engaged in rehabilitation work in Maharashtra have expressed the desire that it would be useful to bring the government departments, donor agencies and NGOs together to reflect on the nature of relief, reconstruction and rehabilitation work implemented It was also felt that it would be useful to learn from the experiences of the government departments, community leaders and the NGOs engaged in the rehabilitation of Uttarkashi earthquake affected people The broad objective of the proposed workshop was to learn from the experience of the government and the NGOs in relief, reconstruction and rehabilitation in Uttarkashi and devise ways to strengthen the rehabilitation process in Maharashtra Further the workshop aimed at providing an independent and practical forum in which relief and rehabilitation issues could be discussed and approaches presented for use in other disaster situations in India

The workshop was organised jointly by the Centre for Research on the Epidemiology of Disasters (CRED), Catholic University of Luvain, Brussels, Belgium, and Tata Institute of Social Sciences, Bombay The workshop was funded by the European Community Humanitarian Office (ECHO), European Union, Brussels

The workshop suggested that a comprehensive disaster management plan and operational policy should be developed at national, state and district levels, addressing both natural and man made disasters, such as riots, epidemics, and famines The plan should include structures defining the chains of authority and reporting mechanisms as well as mechanisms for accountability of grievances The exact relationships and responsibilities between governmental bodies, NGOs community organisations as well as donor agencies and the media should be spelled out The lack of such a pre existing plan was felt to be contributory to much of the problems faced in the Uttarkashi and Maharashtra earthquake

The plan emphasised the co ordination of NGOs at local levels, and of donor agencies through a formal pre existing committee referred as the Joint Committee for Emergency Co ordination (JCEC)

The JCEC should be a permanent structure at the ministerial/secretarial level, convened by the aforementioned office The JCEC should among other representations e g academic institutions, press, international agencies, reserve a limited fixed number of permanent seats for NGO representation These seats should be filled by elected representatives from the NGO community the nominatory mechanisms of which should be decided by the NGOs themselves The representatives should be elected for a fixed term and reflect the views of the participating NGO consortium The state authorities should make every effort to maintain a dialogue with the NGOs through the JCEC so as to ensure the success of this initiative

The co ordination functions of the JCEC, or its operational cell, should address the specific areas identified as being problematic during the recent experience (1) Co ordination of volunteers and spectators at the site of the disaster, (2) Setting up and co-ordinating standard registration systems between implementing agencies, (3) Co-ordinating available public-sector expertise with NGO expertise to improve field efficiency and minimise duplication of efforts, (4) Co-ordinating incoming relief supplies and their distribution, (5) Providing regular situation briefings and facilitating information exchange drawing on its asset as a multiparty committee During the relief phase it is also proposed that a regular news-bulletin would facilitate the co-ordination process between the NGO and the government, (6) Controlling and managing the visits of VIPs to the site, in order to reduce hinderance to the relief process, (7) A mechanism should be developed to register NGOs according to their area of speciality and expertise, based on both their own mandates and proven track-record This preparatory measure would assist in putting forward an effective programme in a crisis situation, using the most appropriate agencies for the most appropriate tasks, (8) An information system for hazard prone areas that provides reliable data on additional risks such as dams, toxic industries, nuclear installations, should be developed A special risk mapping for areas prone to floods, cyclones, droughts and earthquakes should be undertaken urgently This should also include the establishment of emergency profiles listing human and structural resources in risk areas, (9) The co-ordination between the government and NGOs would be greatly enhanced if government policy is announced in a phased manner

It was also felt that such preparedness in disaster prone country like India would not only enhance the effectiveness of relief, but minimise the set backs to the developmental processes that the country can ill afford

The process of post disaster reconstruction and rehabilitation programmes in India have broadly followed the trends of international experience, with considerable modification because of local conditions and institutional dynamics One overriding similarity however, is the lack of institutional learning and hence, the repetition of mistakes from one disaster to another, at considerable cost to the affected population Another marked trend has been the massive escalation in investments for post disaster relief and rehabilitation programmes, without a proportional increase in impact and effectiveness This calls for a complete review of the response of the government, NGOs, construction industry and media to disasters

Certain important lessons that have been largely lost on the government and NGOs in the past are (1) Community-based rehabilitation, with a human face, works, and is the most cost and resource effective option in the long run, (2) Enabling local democratic processes ensures rapid recovery of community self-reliance and protects the interest of the weakest sections, (3) Incremental upgradation of local technology to repair and retrofit, is usually much more sustainable than relocation, and (4) external agencies can at best be catalyst for local processes

Chandigarh: Planned Urbanisation?

Laltu

The Punjab government's latest move to acquire land around Chandigarh, ostensibly to construct a residential complex on the city's outskirts to regulate urban growth, will result in ousting thousands of villagers.

ON May 29 the Punjab government issued a notification for the acquisition of 7,543 acres of land in the north western part of Chandigarh The area which falls in Kharar tehsil of Ropar district will be used to build an urban residential complex which will adjoin the city beautiful The purpose of the acquisition according to the Punjab government which has been claiming Chandigarh as its own will be to regulate the process of urbanisation in the periphery of Chandigarh prevent unplanned growth and encroachments and also to safeguard the class and quality of life in Chandigarh by taking off some of the pressure on the infrastructure of the city

The notification relates only to the first phase of the project which will eventually be spread over an area of 25 000 acres The estimated cost of the first phase of urbanisation is Rs 1,200 crore While the intentions of the state government would appear to be laudable on the surface, they have however sounded the death knell over the future of more than 50 000 villagers who have been living in the area for the past several decades Residents of the area have depended largely on agriculture for their livelihood and a large number are employed in government and private jobs in the city They are also dependent on the infrastructure of the city of Chandigarh for facilities like education and health Faced with the proposal of acquisition of their landholdings the villagers fear not only the loss of their homes but also of their very source of livelihood

The land acquisition notice comes as the culmination of a two-year long process of deliberations, land surveys and proposals which have been passed despite the organised resistance of the villagers of the 15 villages falling within the demarcated area The villagers have formed several groups to oppose this project, the main one being the Pind Bachao Committee led by a local Congress(I) politician Gurbaksh Singh Dhillon While some of the residents are keen on obtaining the best possible compensation others are adamant that they will not leave their land at any cost The movement at this juncture however seems scattered and is fairly weak and none of the Left groups or parties in the state has so far come forward to take a stand on the issue In fact the only senior politician in the state who has opposed the plan has been the dissident Congress(I) leader Jagmeet Singh Brar

A survey conducted in some of the affected villages is a revealing statement on the extent of the problem With a population of over 10,000, village Naya Gaon subsists mainly on the income earned from its residents who are employed in government jobs in Chandigarh Most houses here fall outside the 'lal dora' and will therefore not be eligible for compensation The land of the village falls under section 4 of the Forest Act Its fields are irrigated from the bund constructed by the government at a cost of crores of rupees With the cultivable land to be acquired by the government this bund will be rendered useless According to the villagers without a land for land compensation policy, no amount of compensation can help since the farmers can only earn through farming The women of the village are also active participants in the struggle and the villagers have held 10-12 meetings in the past couple of months on this issue They have formed a joint committee and intend sending delegations to the chief minister and prime minister "If we die we will take others with us The Congress government is a foisted government and in the next elections we will vote for the Akalis But we will take help from anyone who supports us"

"Why does the government want a township in this area which is so fertile?" The only reason, according to the villagers of Tida, for the construction of the township is the political aim of eventually giving up the claim to the city of Chandigarh By building an alternative city the state government can claim that it had no need for the city of Chandigarh

"Just like birds on a tree who return to their perch time and again despite being driven away, so will we return to our villages with our children and grand-children even if we are ousted from our homes" Though the state government has promised an attractive package of compensation for the residents of village Togan the details of the package are yet to be made public The only aspect that is clear is that the villagers will not be given land in lieu of the land acquired Therefore, whatever compensation they receive will be monetary and it is unlikely to enable them to acquire land elsewhere in view of the shortage of land and escalating prices There are also several loopholes in the process of awarding compensation since the amount is to be based on calculations of the land registration fees which are usually undervalued to escape payment of tax Over the years the area has also seen the mushrooming growth of houses outside the 'lal dora' or residential area These ostensibly are illegal structures and therefore not entitled to compensation Moreover since the villagers of the area have been cultivating land for decades, it is difficult for them to switch to some other form of employment, uneducated and illiterate as they are

While the state government has finalised all its plans for the building of the new city and has already approached HUDCO to finance the first phase of the project, its plans regarding the fate of the residents is nebulous The logic for putting the cart before the horse, according to the state government is that no plans can be made until the first step – the notification for land acquisition - is taken This is also offered as the reason why the residents of the area have received absolutely no official response to their numerous appeals, memorandum, and even protest meetings over the past one and-a-half years

Interestingly the villagers are not the only ones to protest against the plans for this new city Criticism has also come from the ministry of environment against the proposed intention of the state government to effect a change in the land use of the area under sections 3 and 4 of the Forest Act

In response the state government announced that it had decided to use only 5,000 of the 8,000 acres originally surveyed in order to leave out any area under the Forest Act The notification however when finalised was for 7,543 acres, nearly the entire area initially surveyed

There has also been some resistance to the idea of new Chandigarh from a group calling itself the Save Chandigarh Committee The group fears that the construction of a new city will merely increase the pressure on the city of Chandigarh rather than deflecting it as has happened with the cities of Mohali and Panchkula The unplanned growth of these satellite townships which do not have adequate infrastructure has resulted in increasing the pressure of population on Chandigarh The Chandigarh Citizens Committee has been investigating and documenting the violation of democratic rights of the people living in these villages

SCHEDULES

Schedule 17—Accounting policies and notes forming part of the accounts for the year ended 31st March 1995.

I **Principal Accounting Policies**

(1) **General**
The accompanying financial statements have been prepared on the historical cost basis and confirm to statutory provisions and practices prevailing in the country

(2) **Transactions Involving Foreign Exchange**
Monetary assets and liabilities as well as outstanding Forward Exchange Contracts are translated half yearly at rates prescribed by FEDAI and the resulting profit/loss is accounted for Guarantees, Letter of Credits and Acceptances are translated at T T (Middle) rates

(3) **Investments**
Investments of the bank have been bifurcated into ' Permanent Investments" and "Current Investments" Permanent Investments are valued at cost Current Investments are valued at cost or market value whichever is lower except for Treasury Bills which are valued at cost

(4) **Advances**
(a) Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances, based on a periodic review of advances and after taking into account the realisable value of securities and the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, The Export Credit & Guarantee Corporation, similar statutory bodies and prudential accounting norms laid down by RBI for the asset classification and provisioning requirements thereof
(b) Provisions in respect of doubtful advances have been deducted from advances
(c) Provisions have been made on gross basis

(5) **Fixed Assets**
(a) Premises and other fixed assets have been accounted for at their historical cost
(b) Depreciation has been provided for on the diminishing balance method at the rates specified in the Income Tax Act, 1961

(6) **Staff Benefits**
Provision for gratuity/pension benefits to staff has been made on an accrual basis Separate fund for gratuity/pension have been created

(7) **Net Profit**
(a) The Net profit disclosed in the profit and loss account is after considering
(i) Provision for taxes on income
(ii) Provision for doubtful advances
(iii) Provision for depreciation in the value of specific investments which are valued at lower of cost or market value, but
(b) Without considering interest income in respect of non performing assets taking into account the prudential norms laid down by RBI

II **Notes on Accounts**
(1) The Bank has preferred an appeal against the order passed by the Income Tax department resulting in a demand of Rs 455 lacs out of which Rs 116 30 lacs have been paid and provided for resulting in the charge in the current year for Rs 10 49 lacs after adjusting balance in provision account Based on Tax Consultant's advice, the Bank is confident of this appeal being decided in its favour, since some of the similar issues involved have been decided in the Bank's favour in the past assessments Accordingly, no provision has been made for the balance amount
(2) As in the previous years, some of the operating expenses are being accounted for on cash basis The effect of these on the profit for the year is, though not ascertainable, will not be material
(3) Head Office administrative expenses have not been charged in the accounts and provision for taxes has been computed without deduction of such expenses
(4) Provisions and contingencies include Rs 3,460 96 lacs (including Rs 16 26 lacs for prior years) being Rs 3,232.25 lacs provision for Income Tax Rs 220 14 lacs for Interest Tax and Rs 8.57 lacs for Wealth Tax
(5) Previous year's figures have been regrouped/rearranged wherever necessary

THE BANK OF TOKYO, LTD.
(Incorporated in Japan Liability of Members Limited)

AUDITORS' REPORT

Auditors' Report on the Indian Branch of The Bank of Tokyo Ltd.

We have audited the attached Balance Sheet of the Indian Branch of The Bank of Tokyo, Ltd as at 31st March, 1995 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date, in which are incorporated the returns from Calcutta and New Delhi Branches, audited under Section 228 of the Companies Act 1956 by other auditors

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub section (5) of Section 227 of the Companies Act 1956, the Balance Sheet and the Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956 The accounts are therefore drawn up in conformity with Forms 'A and 'B of the Third Schedule to the Banking Regulation Act 1949

We report that in accordance with sub section (3) of Section 30 of the Banking Regulations Act 1949

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory

(b) The transactions which have come to our notice have been in our opinion within the powers of the Indian Branch of the Bank

(c) In our opinion, proper books of account as required by law have been kept by the Indian Branch so far as appears from our examination of those books

(d) The report on the accounts of Calcutta and New Delhi branches of the Bank audited by the respective Branch Auditors were received and properly dealt with by us while preparing our report

(e) The Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account and the returns

(f) In our opinion and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account, read together with the notes in Schedule 17 give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March 1995 and of its profit for the year ended on that date

Iran, America and Other Major Powers

Dilip Hiro

The placatory tone of Iran's recent statements directed at the US has to be seen in the context of the hardening attitude of the US Congress towards Iran and the deteriorating economic situation in Iran.

THE conciliatory statement by Iranian president Ali Akbar Hashemi Rafsanjani, in an interview with the Cable News Network (CNN) on July 2, that America and Iran should desist from raising tensions in their mutual relations signals a change in Tehran's policy.

On the other hand there is no sign of a lessening of the importance of Iran as a test case for major world powers – Russia, China and India – to show their independence from the United States, the sole superpower.

Rafsanjani's placatory tone has to be seen against the background of the hardening attitude of US Congress towards Tehran, and the deteriorating economic situation in Iran.

The US Congress is considering toughening the action president Bill Clinton took against Iran in April when he banned American investment in and trade with Iran for supporting international terrorism and harbouring nuclear armament ambitions. Clinton's move caused a severe drop in the open market price of Iranian rial versus US dollar, the currency in which Iran's major export, petroleum, is sold Drastic steps by the Iranian government salvaged the situation, but just. In May inflation in Iran reached a record 58 per cent a year.

So far Clinton's efforts to secure the co-operation of other Western countries, especially the European Union, to impose trade sanctions on Iran have failed.

Elsewhere, Iran has emerged as the touchstone of the independence of such leading powers of the world as Russia, China and India.

Despite repeated and public pressure on Russia to cancel its $ 850 mn contract with Iran to complete its nuclear power project started in the late 1970s by West Germany, Muscow has refused to do so. It argues that the nuclear reactors it would sell to Iran would be of the same type as the ones South Korea would supply to North Korea under an agreement hammered out by Washington.

America is also pressuring China not to equip Iran with nuclear power plants. It is trying to find a lever to make China submit to its will. That lies with the Missile Technology Control (MTC) guidelines. The US law requires imposition of sanctions against a country that breaks them.

A fortnight earlier the *New York Times* published a story that the US Central Intelligence Agency (CIA) had concluded that China had delivered dozens of missile guidance systems and computerised machine-tools to Iran. This was done ostensibly to help Iran improve the accuracy of its North Korean-made ground-to-ground missiles. The White House spokesman said that in case the US administration concluded that China had violated the MTC guidelines, economic sanctions against it would apply.

Both Russia and China deeply resent America's overbearing manner During his visit to Moscow, Chinese Premier Li Peng said on June 26: "Russia and China are big countries in the world, and we will not allow anyone to teach us how to live and work." The Russian premier, Viktor Chernomyrdin, agreed: "We will decide for ourselves how to live."

India, another major power, too has shown some independent-mindedness by strengthening its ties with Iran recently. When Rafsanjani visited India in April, the Indian premier, P V Narasimha Rao, broke protocol by travelling to the Delhi airport to greet him. Among other things India and Iran signed a deal for a marine gas pipeline between the two countries.

At 20,700 billion cubic metres, Iran has the world's second largest natural gas reserves. At the current daily consumption rate of 158 mn cu metres, it will take Iran 360 years to exhaust them. Iran's oil reserves stand at 92.9 bn barrels; and at the present extraction rate, these will last 70 years. With a population of over 60 mn, Iran provides a substantial market. And unlike many other West Asian countries, Iran has strong agricultural and service sectors in its economy.

These lucrative considerations weigh heavily with all those who want to trade with Iran.

Then there is the geopolitical aspect of Iran which figures largely in the foreign and defence ministries of Russia, China and India Iran is the most strategic country in the world. It occupies all of the eastern coast of the Persian Gulf; and so for all practical purposes is a neighbour of the six oil-rich Gulf states. It has land borders with Pakistan, Afghanistan, Turkmenistan, Azerbaijan, Armenia, Turkey and Iraq And it shares its Caspian Sea littoral with Azerbaijan, Turkmenistan, Kazakhstan and Russia.

Iran's strategic position enables it to reward those who stand by it. For instance, in the dispute about exploiting the offshore oilfields in the Caspian Sea, Iran has sided with Russia against Azerbaijan. Moscow argues that before Azerbaijan parcels out concessions in the Caspian, there should be a settlement of the territorial claims of the five littoral states: Azerbaijan, Iran, Turkmenistan, Kazakhstan and Russia.

On the diplomatic front Tehran has declared that the breakaway Chechnya, a Muslim-majority autonomous republic, is an internal affair of Russia. This has helped Moscow to downplay the religious aspect of the Chechen conflict.

Whereas the assets of Iran – natural resources and geostrategic location – are more valuable in the medium term than in the short, its economic crisis is current. It stems from the low price for its chief export, oil, and the currency in which it is traded, US dollar. Since Tehran has no control over either, pragmatism requires that it should show moderation towards the US, for now. Therein lies the clue to Rafsanjani's soft approach towards Washington.

New Book from MD Publish Human Social

INDIA DISTORTED

A Study of British Historians of India

By

S C Mittal

The book critically examines the various observations made by the British Historians and the manner in which the facts got distorted. The study also highlights the various prevailing ideological trends in England such as Utilitarianism. Evangelicalism, Romanticism and the British Orientalism and provides an understanding of the various problems of Indian History.

Transferring Personalised Knowledge

Guru's Dilemma

Sugata Marjit

Bequest motives, imperfect capital market and lack of state patronage adversely affect the socially optimal degree of knowledge transfer. In fact the transition from a concentric patronage system to the market-based incentives in the absence of supportive insurance schemes could be detrimental to the healthy preservation of such a culture.

SEVERAL art forms of ancient India survived for ages through interpersonal transmission of acquired knowledge. The oral tradition of Indian classical music [Deshpande 1973; Deshpande 1987; McNeil 1992; Neuman 1977, 1980], and the non-institutionalised tradition of several types of handicrafts, where the secret of craftsmanship is delivered from father to son,[1] are some of the examples of transferring personalised knowledge. Interestingly, such transfers take place beyond the domain of organised markets. Although markets do play a role in the process of survival of such art forms, whether such a role is supportive or destructive is a different question altogether. The cultural heritage of a nation is enriched through sustained growth and preservation of the traditional art forms. The 'guru-disciple' structure of knowledge transfer has been a major characteristic of the Indian society. The oral and non-scriptural tradition of training in Indian classical music flourished mainly because the melodic improvisations, which constitute the backbone of such a form, are extremely difficult to capture in terms of standard notation. Several schools of music emerged in India under the patronage of kings of princely states and feudal lords. In the colonial period, classical music started getting urbanised and now such musical forms have access to national and international markets.

This article focuses on the future of the transfer of personalised knowledge. It is argued that bequest motives, imperfect capital market and lack of state patronage adversely affect the socially optimal degree of knowledge transfer. In fact the transition from a concentric patronage system to the market based incentives in the absence of supportive insurance schemes could be detrimental to the healthy preservation of such a culture.

Personalised knowledge transfer crucially depends on the characteristics of the guru and his disciples, the ability of the guru to teach and the disciples to receive. Among the disciples, the guru usually has his own son and/or other blood relations. The most talented disciple might well be someone with whom the guru has no blood relation. While teaching music, a rational guru must internalise the future socio-economic status of his own son and the most talented disciple. If the process of training has a significant value added on top of the initial endowment of talent, the guru would have enough control in shaping the destiny of his students. Intergenerational bequest motive and altruism would act against each other in the decision-making process of a trainer who would be concerned about the future welfare of his son who might not think of choosing a separate profession simply because he comes from a musician's family. The guru's control over the training process has a phenomenal impact because the best student of a particular school of music is the most likely replacement of the guru himself. At the same time, the guru might be concerned about the quality of music to be preserved which very much depends on the ablest disciple who would be the torch bearer of the particular 'gharana' or the school. Such a social concern of the guru might be in direct conflict with his personal utility derived from the well-being of his future generations. Naturally, the socially optimum transfer would differ from the private one due to the tussle between the private and social interest of the guru. A general problem is that the institutional arrangements which help implement the socially optimal degree of transfer are likely to be absent and then the system cannot attain the first best. Our simple model developed in the next section highlights this problem. The second section deals with possible remedies and associated difficulties.

I
Model

Think of a guru who has two disciplies, his son and somebody else. As discussed earlier, the teacher can confer his acquired knowledge onto his disciples. The extent of transferred knowledge is assumed to be directly proportional to the amount of teaching or attention devoted to the particular disciple. We index the total teaching hour by T, which has to be derived between the two students. Let T_i, be the respective allocation, i = 1, 2. i = 1 stands for the outside disciple, henceforth called the outsider, and the teacher's son is indexed by '2'. The guru would optimally choose T_1 and T_2. Once the knowldge is transferred, both of the disciples absorb the training according to their endowment of talent and hard work. We assume that both of the disciples put in equal amount of effort. In the second stage, the guru is no longer there and the two disciples become the representatives of the particular school of music. However, they confer musical benefits to the society according to their respective abilities. If R_i is the social return from acquired training, then,

$$R_i = a_i \ln T_i \qquad (1)$$

with $a_1 > a_2 > 0$. At this stage, we rule out any competition between the two disciples and focus R_1 and R_2 as separate entities. $a_1 > a_2$ implies that the outsider is more talented than the insider and therefore given the same degree of training, the outsider will deliver greater social utility than the insider. At this stage assume that transfer is costless so that the outsider does not pay anything for the training. Implicit also the assumption that there is a single guru who can bestow the specialised knowledge. Thus, the social benefit is measured by

$$S = R_1 + R_2 \qquad (2)$$

The society only cares for the total utility from such training. It is obvious that given $T_1 + T_2 = T$, the socially optimal allocation of T would be determined by,

$$T_1 = \frac{a_1}{a_1 + a_2} . T \qquad (3)$$

$$T_2 = \frac{a_2}{a_1 + a_2} . T \qquad (4)$$

(3) and (4) are derived by setting $(dS/dT_2) = 0$. However, the guru may think otherwise.

Suppose the guru is also concerned about the contribution of the insider subsequent to the training There are two interpretations of such considerations (a) The guru might be concerned about the insider's material well being when he is in the market (b) The guru might want the name of the particular school of music and its further glorification to be associated with the name of the insider rather than with that of the outsider In this case, we focus on (b) and turn to (a) later At the same time the future of the music also depends on the quality of the future representatives of the school Therefore a socially conscious guru might try not to load the entire training in favour of an unworthy insider

The following describes the guru's optimisation exercise

$$\underset{T}{\text{Max}} \; [\lambda S + (1 - \lambda)\, a \ln \Gamma_1] \quad 0 < \lambda < 1 \qquad (5)$$

or

$$\lambda \left[-\frac{a_1}{T_1} + \frac{a_1}{T_1} \right] + \frac{(1-\lambda)}{T} a_1 = 0$$

$$\rightarrow \frac{T_1}{T_1} = \frac{\lambda a_1}{a_2} < \frac{a_1}{a_1} \qquad (6)$$

(6) shows that so long as the guru puts some weight $(1 - \lambda)$ on the welfare of an insider, the transfer will imply a private bias in favour of a less worthy insider *vis-a vis* the outsider For $\lambda = 1$, the social allocation and private allocation rules yield similar results In case $\lambda = 0$ the guru would be unwilling to train an outsider

The failure to achieve the first best arises because somehow the guru believes that the socially optimal pay off for the insider might not be good enough In other words

$$\ln \left(\frac{a_2}{a_1 + a} \quad 1 \right)$$

must be less than a satisfactory social reservation pay off to the insider that the guru is looking for The greater a_1 is relative to a the higher is the possibility that the guru chooses socially distorted allocation of training effort

If one introduces some sort of market competition between the two disciples, the situation alters considerably First of all no longer would the social utility and individual returns be equivalent As long as T_1 and T are allocated by the guru the society continues to enjoy a benefit S But each individual disciple takes into account the loss of market share due to competition and the concept of private returns comes to the forefront

Let us define r_1 and r as the private returns to the outsider and insider respectively

$$r_1 = A_1 \ln \Gamma_1 - B \ln T_1 \qquad (7)$$

$$r = A_2 \ln T \quad B \ln T_1 \qquad (8)$$

$A_1 > A_2 \Rightarrow$ the outsider can earn more than the insider given the same level of training Also note that $A_1 > B$, $A_2 > B$, $B > 0$ In this case the socially optimal allocational rule continues to be $(T_1/T_2 = a_1/a_2)$ because by definition the social welfare criterion does not include market determined categories The society recognises the contribution of the disciples to the extent they enrich the social value of music However the guru might be interested in increasing r and should be interested in optimising (assuming r_1 and R_1 have comparable units of measurement)

$$\lambda [a_1 \ln I_1 + \ln \Gamma_1] + (1 \quad \lambda) [a \ln \Gamma_1 + A_2 \ln I \quad B \ln \Gamma_1] \rightarrow \ln T \qquad (9)$$

It is easy to derive the optimal allocation rule by setting the derivative of (9) with respect to T_1 equal to zero

$$\frac{\Gamma_1}{T_1} = \frac{\lambda a_1 - (1 \quad \lambda) B}{a_1 + (1 - \lambda) A_2} \qquad (10)$$

Since (10) is less than $(\lambda a_1/a_2)$ there is further distortion in allocation These results do not depend on the particular functional specifications In the appendix, we derive similar results under more general conditions

II
Implementing the First-Best

In this section we try to look at the institutional arrangements that would help in implementing the first best (a) A straightforward way of solving the problem at least in the domain of competition, is to provide state patronage to the guru and the insider so that the guru can be assured of some sort of royalty payment by the state compensating the subsequent financial loss to the insider This is not to say that such intervention would eliminate the problem completely But it is a step towards the right direction The feudal or princely patronage of North Indian classical music in the 17th and 18th centuries [McNeil 1992] probably helped the masters through a long-term relationship between the Court and the generations of insiders Greater exposure to the market in the later years coupled with inadequate protection of property rights might have accentuated the problem of knowledge transfer

(b) The role of capital market becomes quite important in this context It could be argued that a brilliant guru could quote a high enough training fee from the outsider and the talented outsider would likely pay the price in expectation of higher returns in the future Such a pricing mechanism would in fact compensate the loss of an unworthy insider and hence a better allocation of resources An *ex post* contractual arrangement between the guru and the outsider would be impossible to enforce Therefore, an upfront payment is the likely solution The outsider may have to borrow in the market and with rampant adverse selection problem as well as the tremendous uncertainty in the market for musicians, he must face an extremely imperfect capital market with a fair degree of credit rationing and interest premium All of these make the required upfront payment nearly impossible

(c) An unworthy insider may be quite good in performing some other economic activities with fairly high rate of return and self-selection mechanism might help the guru in concentrating on worthy outsiders However, such opportunities would be severely restricted in a stagnant economy Acquiring specific human capital would be difficult due to the imperfections in the capital market Above all, the guru might like the insider to be associated only with music Expansion of market based opportunities would certainly help in providing the incentives for better allocation

The purpose of the article has been to highlight the problems associated with personified knowledge transfer We have argued that interpersonal knowledge transfer, the characteristic of traditional art forms, would not yield socially desired outcome in the presence of insider - outsider distinction by the transferor Concerned about the future prospects of an unworthy insider, a guru might be reluctant to transfer the required knowledge to a talented outsider Such problems are difficult to overcome without a broad-based state patronage or a significant development of market based opportunities

We have used a standard analytical model in this context which is of course, not in the tradition of research in this area But we hope that interesting issues such as the one here, can be modelled properly to get to the right intuitions and explanations of these phenomena

Appendix

Deriving the results under more general specifications

$$\text{Let } R_i = a_i f(T_i) \text{ into } f' > 0,\ f'' < 0, \quad i = 1, 2 \qquad (A1)$$

$$S = a_1 f(T_1) + a_2 f(T_2) \qquad (A2)$$

Therefore, $(dS/dT_2) = 0$ implies,

$$f(T_1) = \frac{a_2}{\quad} \; f(T_2) \qquad (A3)$$

Since $f'' < 0$, (A3) $\rightarrow T_1^0 > T_2^0$ as $a_2 < a_1$ where T_i^0 solves (A3), $i = 1,2$

The guru's optimisation will lead to,

$$f(\tilde{T}_1) = \frac{a_2}{\lambda a_1} \; f(\tilde{T}_2) \qquad (A4)$$

(A4) implies $\tilde{T}_1 < T_1^0$, $\tilde{T}_2 > T_2^0$ as $0 < \lambda < 1$

Let $\phi_1 (T_1, T_2)$ denote the return function for the ith disciple with,

$$\frac{\partial \phi_1}{\partial T_1} > 0, \quad \frac{\partial \phi_1}{\partial T_2} < 0, \quad \frac{\partial \phi_2}{\partial T_2} > 0, \quad \frac{\partial \phi_2}{\partial T_1} < 0$$

(A4) then changes to

$$f(\hat{T}_1) = \frac{a_2}{\lambda a_1} f(\hat{T}_2) + \frac{(1-\lambda)}{\lambda a_1} \frac{\partial \phi}{\partial T_1} - \frac{\partial \phi}{\partial T} \qquad (A5)$$

It is obvious that $T_1 < T_1 < T^0_1$ Note that we are using $T_1 + T_2 = \bar{T}$, and the second order conditions in (A5) are assumed to be satisfied

Notes

[I am indebted to Adrian McNeil for stimulating discussions]

1 The reference to the son' rather than to the daughter' is made to capture the fact that in classical vocal music women were not particularly encouraged to be the torch bearers of the tradition However this does undermine the rise of eminent female vocalists In the classical dance forms women were particularly influential The salient note of 'sexual discrimination is to be excused keeping in mind the theoretical objective of the paper

2 Similar issues in the literature on international technology transfer in the absence of property rights have been discussed by Kabiraj and Marjit (1992 1993)

PARTICIPATORY RURAL APPRAISAL AND QUESTIONNAIRE SURVEY

Comparative Field Experience and Methodological Innovations

Neela Mukherjee

Hardbound Rs 250

The present study is an attempt to compare conventional methods of investigation like questionnaire surveys with participatory methods like PRA (Participatory Rural Appraisal) as evolving in recent years PRA method has been widely demonstrated to work well at community level but the future challenge lies in its scale of enquiry, whether it can work equally efficiently at the meso or the micro level The recent empirical evidence raised issues, opportunities and opens up potentials for methodological innovations

Lisu World

T V Sathyamurthy

Au sud des nuages. Mythes et contes recueillis oralement chez les montagnards lissou (tibeto-birmans) by William Dessaint and Avounado Ngwama; Gallimard (L'aube des peuples), Paris, 1994, 647 pages and 10 illustrations.

THIS is a monograph about the Lisu, exceptionally tough and deeply egalitarian highlanders. They number about a million, speak a Tibeto-Myanmar language, and live in an extremely remote area at the eastern extremity of the Himalaya, close to the meeting point of the borders of Myanmar, Tibet and Yunnan (in China). A few small groups of Lisu have ventured into Indian territory and Thai territory along the Myanmar borders. "This superb monument to the glory and to the memory of the Lisu world" (Condominas) consists of a description and analysis of Lisu society and culture, followed by more than 150 myths and tales, all narrated by a couple whose daughter and son-in-law, the authors of this book, have very carefully and beautifully translated these texts. This collection of myths and tales has already attracted a great deal of praise from French anthropologists (e g, Condominas, Balandier) and mainstream journalists (e g, Rollin) alike.

Tibet, where a great and unusual civilisation flourished and survived into the present century, has held a fascination for the people of western countries as well as for the Chinese and the Indians for a long time. With the expulsion of the Italian Catholic missionaries from Lhasa in the 18th century, foreigners were denied access. As a result, Tibet became even more 'mysterious' and its fascination grew. In addition to the awe-inspiring physical barriers that defended its access, even more insuperable political fences were built in order to keep foreigners out.

The British colonial empire, wishing to surround India with a series of buffer states beyond the reach of other European powers, was most enthusiastic in its support for Tibet's self-imposed isolation. Explorers, adventurers, missionaries, merchants and mad men from different countries, however, attempted to enter Tibet and reach Lhasa, using every trick in the book, and even some not to be found in any book. In the event, only 9 or 10 of such interlopers succeeded.

Among them were Father Huc and Father Gabet (France) in 1846; and Alexandra David-Neel (France) in 1924. Although extremely strict in respect of potential trespassers not accredited by the British or Indian governments, the colonial authorities nevertheless despatched a number of agents to explore the country and bring back topographical surveys made with instruments hidden in their luggage or in their clothing. Some of the most daring and adventurous British officers of the Indian Army volunteered to undertake such risky expeditions, although the most efficient agents of the Raj in Tibet happened to be Indians, the so-called 'pandits' who played a major role in the Great Game.

The eastern Tibetan borderlands were even more difficult of access, both for geographical and for political reasons. At least two areas were shown as white spots on the map and could be said to have remained unexplored until the eve of the second world war: the Ngolo country to the north-east (in the neighbourhood of the Amne Machin mountain range which some believed to be among the highest mountains in the world), and the Lisu country to the south-east (overlapping the then undemarcated border between China and Myanmar, including the incredibly rugged mountains on either side of the Salween). Therefore, the danger and mystery attached to the unknown applied to these areas even more than to central Tibet.

The Chinese called the valley of the Salween, stretching between the mountain ranges occupied by the Lisu, 'the Valley of Death'. The American and British Protestant missionaries, frustrated by the failure of every attempt on their part to penetrate the area in order to save souls, named it 'the kingdom of Satan'. A leading French geographer wrote that it was "one of the last strongholds of savagedom". Thus, Lisuland was virtually inaccessible, defended as it was not only by some of the most forbidding mountains in the world, but above all by the 'ferocious' Lisu people whose poisoned arrows stopped dead every intruder into their territory.

Throughout history, strong imperial governments in China have tended to adopt a policy of territorial expansionism. All neighbouring lands belonging to 'barbarians' or 'savages' were good game for conquest and annexation to the Middle Kingdom. Punitive expeditions and pacification campaigns were despatched to quell armed resistance by local people. These included looting, rape, pillage and massacre by Chinese troops. From the Lisu point of view, ill-disciplined foreign (i e, Chinese) soldiers were no different from ordinary highwaymen. The Lisu put up such fierce resistance that Lisuland remained unadministered until the arrival of the People's Liberation Army of China (PLA) in 1953, followed by the establishment of a Lisu Autonomous Region in 1954.

On the Myanmar side, however, Lisuland was left largely to its own devices by the British authorities and treated as 'unadministered tribal territory'. After Myanmar became independent, the Lisu area was included as a part of the Kachin state and given a high degree of autonomy. Thus, Lisuland has remained "the last stronghold of total independence in respect of invaders as well as adventure-mad scientists" (Condominas, Preface).

Yet, two French explorers (Andre Guibaut and Louis Liotard) did enter Lisuland in September 1936 and succeeded in leaving the place alive three months later. They were more fortunate than the two German explorers who entered Lisuland in 1908-1909, only to be killed. Liotard himself was killed during a subsequent expedition to the Ngolo country in 1940. Events during the following decades made further expeditions into this area completely impossible. The situation prevailing in Myanmar before, during and after the war contributed to the closing of all approaches to Lisuland.

It was not until 50 years later that Dessaint "the first scientific traveller, Chinese or western, to follow in the footsteps of Guibaut and Liotard, succeeded in going up the Salween and in roaming throughout Lisuland proper...on the ill-defined footpaths that scale the abrupt slopes of these terrifying mountains" (Condominas, in the Preface). Indeed, for the last 30 years, William Dessaint has studied the Lisu and produced a number of important papers about these previously virtually unknown people.

In 1962, Dessaint had heard of a Lisu chief famed for his sagacity and for his knowledge of the oral traditions of his people, their myths and their poetry. Dessaint eventually contacted the chief and discovered that he and his wife were bards of great talent in their own right and that they possessed deep knowledge of their own people, who were still out of reach of administration living as they did on either side of the Myanmar-Thailand border. Eventually Dessaint, an anthropologist and linguist, became a part of the Lisu world. Many years later, he wedded his field "by taking as wife the daughter of a bardic couple, heiress to the guardians of Lisu oral tradition. He was adopted, [he] observed, participated, and above all, listened. With the help of Avounado, his wife, Dessaint recorded on tape, put down in writing, interpreted and translated. After decades of work, he has now opened the access to Lisu society and civilisation" (Balandier in *Le Monde*).

Dessaint and Avounado have offered the only complete description so far of Lisu society and civilisation.

The work presented here involved a gigantic task of transcription and translation. The first part of the book consists of a monograph on the Lisu which is of outstanding quality for the reason that it combines together an insider's view provided by Avounado with Dessaint's view as an outsider. As Condominas has pointed out in the preface, its importance stretches beyond the confines of the Lisu society because it throws light on other Tibeto-Myanmar societies (e g, the Yi or Lolo) and allows a better understanding of the cultural history of south-western China (and, especially, Yunnan).

The oral literature of the Lisu is presented in the context of the authors' account of their society and culture. The section on Lisu society and civilisation and the texts of Lisu oral tradition are linked together by a chapter on the characteristics of Lisu oral literature within its social and cultural context. Such an organisation of their material will enable readers to appreciate Lisu myths and tales in a rich narrative tradition. The flavour of these literary creations of Lisu oral tradition is effectively captured in the translation which has managed to preserve the poetic qualities of the texts. But it is worth emphasising that the authors have maintained a strict balance between maintaining the poetic qualities of the tradition and the claims of rigorous anthropological science. At least four major qualities can be discerned in this work – excellence of field research and linguistic proficiency, in addition to scientific rigour and literary depth.

This book should be of interest to Indian readers for a number of reasons. As has already been pointed out small groups of Lisu highlanders crossed over the Indian border into Tirap district in Arunachal Pradesh from about 1947. But it was not until May 1961 that a detachment of the Assam Rifles was dispatched to explore this sensitive border area The Indian armed forces discovered several Lisu villages that had already been established in the upper ranges of south-eastern Tirap (which protrudes into Myanmar territory towards Putao). After the army's visitation, a small administrative centre was established at Daodi (over 7,500' in altitude) which was re-named Vijayanagar and made the headquarters of a new administrative circle. The Lisu were moved into one of the villages, Sidhi, which was re-named Gandhigram. Gurkha veterans and their families were brought in to re-settle the abandoned Lisu villages located near the sensitive border.

In December 1965, an American Protestant missionary family, based in Putao in the extreme northern corner of Myanmar, was expelled because they were alleged to have made repeated (though unsuccessful) attempts to foment local Lisu rebellion against the Myanmar regime. The expelled family persuaded a large number of Lisu and other highlanders to follow them into India. Many highlanders died during the jungle trek from epidemics, famine, accidents, snakes, tigers (38 were said to have been killed by tigers in a single night) and generally from the hardships endured during the trek. The Indian authorities, predictably, would not allow the survivors to join the Lisu people already settled in Tirap district. Most of the refugees had to trek back to the Putao area, whilst a few settled in Myanmar territory close to the Indian border and a very small number did manage to slip through the border into India.

We have in this book the result of work which combines many virtues, not least the story of a living people vibrant with the myths and tales of their past captured *in situ* as they were being told with verve and vitality by an aged bardic couple.

NEW FROM SAGE

This book presents the key results of a study of contraceptive use and fertility in the state of Gujarat, with implications for the country as a whole. Beginning with an introduction to contraceptive use and fertility, the authors present an overview of the demographic characteristics of Gujarat and the pattern of mortality and fertility prevailing there. And also, the implications of the key findings for the formulation of a population policy, while reviewing the implementation of the family planning programme.

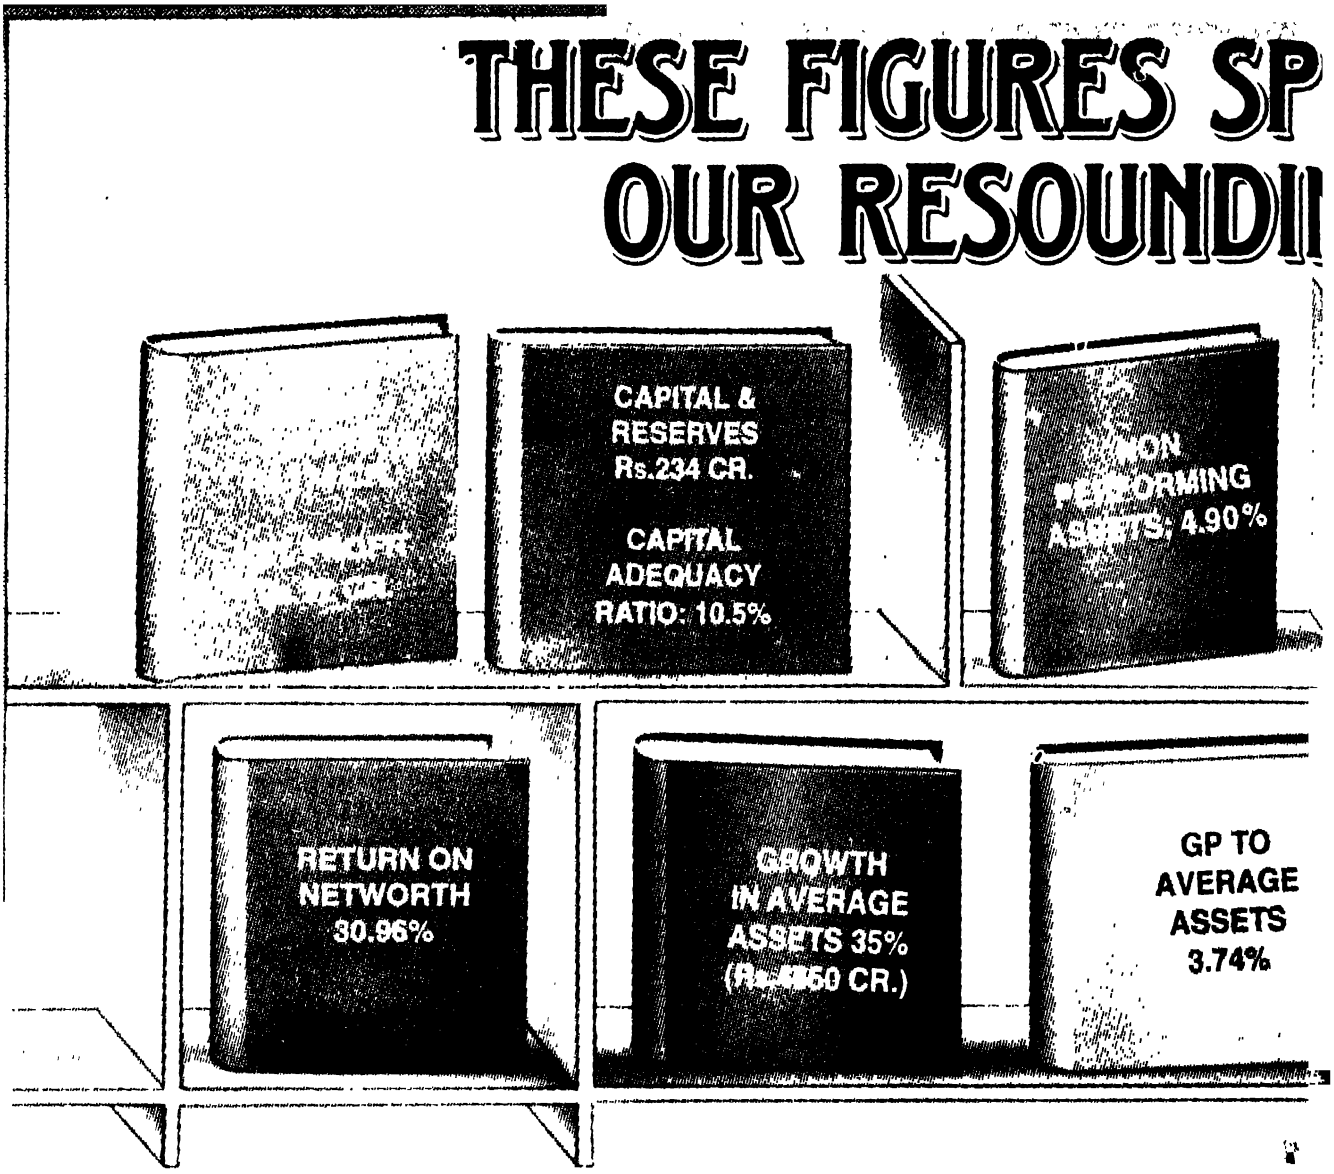
CONTRACEPTIVE USE AND FERTILITY IN INDIA

A Case Study of Gujarat

Pravin Visaria, Leela Visaria and Anrudh Jain

■ 1995 ■ 264 pages ■ Rs 325 (cloth)

REGULATING REPRODUCTION IN INDIA'S POPULATION



Efforts, Results and Recommendations

K Srinivasan

This book explores the efforts that have gone into India's family planning programme, and analyses in detail the levels, trends and differentials in fertility and contraceptive use, using statistical methods which are easy to understand and are explained along sociological principles. The author provides a balanced view, and makes policy recommendations which might be crucial at this stage of India's demographic transition.

EAK VOLUMES ABOUT
G PERFORMANCE.

Presented herein are our Financial Results evaluated on ey performance dimensions, each of which symbolise the fficient performance of Corporation Bank.

What makes the performance evaluation by Corporation Bank distinct is that the critical ratios on Earnings/Efficiency are computed on an average basis - Working Funds, Assets and Total Business are averaged on a 26 fortnight basis.

It is the adoption of such rigorous standards that has made Corporation Bank one of the leading nationalised banks in the country with Return on Assets (Net Profit to Average Assets) at a creditable 1.56%, GP to Average Assets 3.74%, Interest Spread 4.64% (Spread to Average Assets), EPS of Rs.6.48, Book Value Per Share of Rs.20.92 and one of the lowest NPA - 4.90%, all aided by a big leap in profits during 1994-95 - both Gross Profit Rs.174 crore (+61%) and Net Profit Rs.72 crore (+168%).

Backed by an equally impressive track record in house-keeping: (1) All books of the Bank are balanced and tallied upto 31st March, 95. (2) All inter-branch entries are reconciled upto 31st March, 95 and eliminated upto 31st December, 94. And to cap it all, highest credit ratings from CRISIL for Fixed Deposit (FAAA) and Certificates of Deposit (P1+) instruments, all of which makes an outstanding performance.

Victim of Trivialisation

G Jagathpathi

The Politics and Philosophy of Political Correctness by Jung Min Choi and John W Murphy; Praeger, Westport, Conn and London, 1992; pp xiv + 169.

'POLITICAL correctness' (or PC, as it is usually referred to even in serious writing), a post-modernist development, is, unsurprisingly, little known in the conservative bastion that is India. What is indeed surprising is that it has not caught on much either in Europe or elsewhere outside the US. This is perhaps due to the fact that, in president Johnson's 'affirmative action', the PC movement found some pegs to hang its ideas on and thus got to be well known in the US whereas, to the outside world, it got known only through trivialising kinds of occasional notice in the media – such as the recent report on the 'politically correct' kiss and, notably, *inter alia*, the (London) *Sunday Times's* report of some years ago on *The Official Politically Correct Dictionary* by Christopher Serf and Henry Beard (Random House, New York, 1992). But even this report, unfortunately for PC, starts with amusing examples of 'correctness' like 'alternative body image' for 'fatness', 'follicularly challenged' for 'bald', 'terminally inconvenienced' for 'dead' and someone who is 'cerebrally challenged' and 'sobriety-deprived' for a 'stupid drunk'. A more promising attempt could be *Politically Correct Bedtime Stories* by James Finn Garner (Souvenir); this was cited fifth among 'bestsellers' (Hardbacks: General) in the books section of the (London) *Sunday Times* of March 5, 1995; these are supposed to be "traditional tales carefully re-written to express no opinion at all".

The authors are aware that PC has been a victim of trivialisation. "Although some of the complaints raised by PC'ers may sound trite – such as whether the title 'chair' or 'chairperson' should be used – the thrust of PC should not be trivialised". But a substantial part of the blame for making PC look trivial has got to be borne by PC'ers themselves because a large number of 'politically correct' transformations of ordinary words are just comic and/or irritant etymological acrobatics without any noticeable improvement in 'correctness'. If 'fat' is not 'correct' because it makes one laugh at, or dislike, a fat person, is 'alternative body image' going to improve matters? For one thing, it is vague; it can mean 'thin', 'fat', 'short', 'tall' or any of the many alternatives possible. Making meanings vague is bad semantics and using three or four words instead of one and making things worse is unwise. 'Dead', again, is not value-laden and does not need etymological purification. Unfortunately, to PC'ers, provocativeness has long seemed to be the better part of evangelical zeal – an age-old weakness of the proselytiser, evidenced in our own country during the heyday of proselytisation by neophytes being made to do things which would have been abhorrent to them in their abandoned faiths. This is a pity because PC does have its heart in the right place and, to my mind, the most convincing evidence of this motivational rectitude is PC's immensely elevating and brilliant rendering of 'disabled' into 'differently abled'. What then has gone wrong? Why is it PC has come to be considered subversive and desirably *verboten* or, by the less intolerant, as only verbally radical but, in the long run, likely to be detrimental to societal fundamentals?

For all the high scholastic credentials of the authors, there is no recognition by them of this central issue: how have PC'ers managed to make something serious look silly and why do others think it could be destabilising? The title they give to their book promises a thoughtful and incisive exigesis that would dispose of this central issue by the power of its argument. But what we are treated to is in fact a tiresomely repetitive and disjointed refutation of their principal *betes noires* – Alan Bloom, Dinesh D'Souza and Roger Kimball. It is more politics than philosophy.

Dinesh D'Souza is an American citizen of Indian origin who, while very young, rose to an important position in Regan's ensemble of political appointees. The authors repeatedly attack his book, *Illiberal Education* (The Free Press, New York, 1991), a brilliant and well-researched discussion of the rather mixed, confusing and even topsy-turvy kind of impact that the loftily intentioned 'affirmative action' programmes of president Johnson have had on educational standards and campus life in many Amerian universities, Harvard, Michigan, Howard, Duke, Stanford and the University of California at Berkeley, among them. (Incidentally, D'Souza's expose reminds one of the similarities between the American experience and the constitutionally privileged and politically well-entrenched job-reservation policies and special assistance programmes in India in terms of aims and consequences; that D'Souza, a quondam Indian, does not at all mention these similarities even in passing is puzzling because the Indian policy-package for the backward sections of the population is a great deal anterior in time to the American.)

PC, as such, hardly engages D'Souza's attention – actually, there is only one reference to it in the whole book. The reason why, even so, the authors worry about D'Souza and other such critics is that, at one level, PC'ers – rather than PC as such – tend to be supportive of attitudes that find Shakespeare and Milton, for example, merely words that can mean many different things and, therefore, nothing in particular. The philosophical basis of such attitudes needs careful unravelling but the authors are not as helpful in this regard as they ought to be.

PC has to be understood at least at three levels. At one level, it is a campaign to identify in language all words and phrases which are much too value-laden and polysemic and either modify or replace them. Whatever is (but, of course, everything is) "mediated through language", as of now, is inconstant and multi-hued and therefore what is thought to be reality is a "linguistic invention". PC has emerged as an action-committed variant of post-modernism and the logic of action renders it political. But any programme of political action aimed at getting across to large masses of people radically new ideas about the human condition cannot naively climb on the bandwagon of post-modernism because the confident delineation of a reasonably unambiguous vision in post-modernist terms is inherently infeasible; for, according to the avowedly post-modernist authors, "due to the fragile and indeterminate nature of interpretation, the linguistic reality envisioned by post-modernists is never finally settled and is always susceptible to revision. Interpretations can always be reworked". But this is infinite regress – pure and frustrating – and the escape provided by post-modernists is that "the anchor for norms is a series of interpretations" and "social reality" should be looked upon as a "chain enterprise". On the other hand, the high degree of stability that the life around us does seem to have, and the quite unambiguous existentiality that the 'object-world' around does seem to exhibit, have been, are and presumably shall continue to be, sufficiently long-term phenomena and, though mediated by language, cannot be dismissed as mere hermeneutical fancy. Physically and biologically engendered impermanence ('naswarata'), which apparently is in the world's 'genes', and 'reality', which is made highly variable by interpretation, which is just playing ('lila') with words, between them land us in an illusory world ('maya') and make the post-modernist view-set look very much like the vedantic perception.

At another level, post-modernism – and PC – question the tenability of standards, norms, 'eternal' values and other 'foundationalist' concepts on at least three clear grounds. First, all these are mediated

by language and therefore cannot pretend to objective validity of any kind independent of language. Second, culture is a product of social intercourse and, as a result of a multitude of biological, geographical, diachronic and (the already mentioned) linguistic factors being operative during such intercourse, humanity's cultural artefacts come up in an infinite variety and each of them is a *Ding an sich* ('thing in itself'). There can be no question, therefore, of a 'single' (meaning 'western' most of the time) culture equipping us with eternal standards to judge artefacts of other cultures by. Multiculturalism – the linguistic, cultural, sociological and political manifestation of the incessant change taking place in Society – makes the recognition of several cultures as autonomous, self-validating entities logically inevitable and democratically obligatory. This has led to the questioning and unsettling of curricula, standards, the 'objectivity' criterion and other concepts associated with educational, literary and cultural praxis. Thus: you cannot test the African-American applicant for admission to a college or a university by standards appropriate for – and only for – American whites. The folk art of the Red Indian is as valid a cultural artefact on its own terms as Shakespeare is on his own and curricula should therefore reflect this multicultural diversity. Impeccable as a genuinely democratic tenet – yes? But let D'Souza be heard:

> Virtually all American universities have changed their admission rules so that they now fill a sizeable portion of their freshman class each year with students from certified minority groups – mainly blacks and Hispanics – who have considerably lower grade point averages and standardised test scores than white and Asian American applicants who are refused admission. Since it is often difficult for minorities admitted on the basis of preferential treatment to compete, most universities offer an array of programmes and incentives, including cash grants, to encourage these students to pass their courses and stay in school. The coveted perks of so-called affirmative action programme have sometimes been extended to other groups claiming deprivation and discrimination, such as American Indians, natives of third world countries, women, Vietnam veterans, the physically disabled (now sometimes called the "differently abled"), homosexuals, and lesbians [Dinesh D'Souza, op cit, p 2].

Much of this is a stark repetition of recent Indian history in the US. It will be some time before, out of this chaos of problems pressing for solutions and of solutions creating probelms, some *modi vivendi* of enduring meliorative capability emerge such as would ensure that multiculturalism – a particular stage in cultural evolution – harmonises rather than disintegrates. It is in this context of confluent cultures that PC has become a politically significant movement and has in the process become much less than wholly negativist like post-modernism.

At a third level, PC questions prevalent epistemological procedures which proceed on the assumption that there are truths to be discovered and that objectivity is not impossble. The paradigm here is of course modern science. Assumptions of this kind have done mankind proud and neither PC'ers nor even post-modernists have dared to dismiss science as a mere 'linguistic invention' of no consequence; it is much too credible and palpably beneficent an existential entity to be dismissed away as linguistically manufactured 'maya'.

This reviewer doubts whether, notwithstanding the many valid points made by PC and post-modernism, they really sort of add up to an acceptable 'weltanschauung'. The fact that the more you keep searching for the 'essence' the more it keeps retreating does not invalidate the search itself nor can there be a denial of the possible existence of an 'essence'. Values and standards may change over time but there is in them a semantic core stable enough for some time to make social intercourse possible. There is no imminent danger of 'tomorrow' meaning 'yesterday' or of 'death' meaning something else when it stares us in the face and often makes us all disheartened beyond endurance. Surely, 'love' and 'marriage' mean to post-modernists and PC'ers what they mean to others and seldom is there any thought of stopping to consider the many possible meanings of love before proceeding to the riskier stages of involvement. That there are many words in every language each of which means many different things evidences the utter inadequacy of the linguistic effort of man; nobody has prevented the improvisation or creation of different words for different meanings. How difficult it is on the other hand for a new word describing a new, distinct and definable development in behaviour to get into the lexicon is evidenced by roughly the year it took for 'bodyline' to enter the sacred precincts of the Oxford English Dictionary. It is also a fact that 'double entendre' is the staple food of poets, diplomats and writers who often want what they say to mean less or more than what it seems to mean. So, to keep things going in this world of ours, we seem to need vagueness, imprecision and polysemy as much as clarity, precision and univocality.

The name, 'post-modernism', itself is no model of precision; it is not much of a help by way of telling us what it is all about – it begs far too many questions. Would the designer who happens to design the successor to (the modern) jeans be a post-modernist too? The debunking of pretentious philosophising – indeed of whatever is pretentious – is the concomitant obverse of the incessant effort to man to theorise about the world around him – and himself – but debunking by itself does not amount to a theory or a philosophy or even a hypothesis. There can be no denying of the brilliance of much post-modernist thought but, as Gurpreet Mahajan observes:

> Consequently, to retain at least some of the philosophical insights of post-modernism, we need to make a distinction between its potentialities of negation and its norms of affirmation. We need also to rethink the concepts through which anti-foundationalism is given a positive content [*Economic and Political Weekly*, Vol XXX, No 4; pp PE-45-46].

This is an impossible proposition. Critic can't turn creatior; as G K Chesterton says in another context, "The criminal is the creative artist; the detective only a critic". It is true that every great philosopher is critical of preceding philosophers but that kind of criticism is only a prolegomenon to the exposition that follows.

The authors do not do justice to the quite big task that they took on. Post-modernism and PC will finally end up only a guide-post or two on the paths that contemporary science, philosophy and culture build. Even so, they certainly deserve a more systematic appraisal than a somewhat repetitive and unsure plea in self-defence. In any case, there is a good deal in a name and post-something-or-the-other is hardly a name that a self-respecting intellectualism should let itself be known by

NOTES TO THE FINANCIAL STATEMENTS AS AT MARCH 31 1995

(Amounts in thousands of Indian Rupees)

1 Summary of Significant Accounting Policies

(a) General

The accompanying financial statements are prepared under the historical cost convention (as modified by note 1(e) below) and conform to statutory provisions and practices prevailing within the banking industry in the country

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities are translated at the exchange rates notified by the Foreign Exchange Dealers' Association of India ('FEDAI') at the year end except in the cases of deposits accepted under the Reserve Bank of India's (RBI) Foreign Currency Non Resident Accounts scheme (FCNRA) which are valued at the relevant rates notified by RBI and deposits under the Foreign Currency Non Resident Banks scheme (FCNRB) which are swapped into rupees at the spot rate prevailing on the date of acceptance The profit/loss on the swaps arising out of the difference in the exchange rate on contract date and maturity date is reported under other liabilities and pro rated over the tenor of such FCNRB deposit All resulting profits/losses on year end revaluation are included in the profit and loss account

(ii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction

(iii) Outstanding forward exchange contracts and spot exchange contracts are revalued at rates of exchange notified by FEDAI prevailing at the year end and the resulting profit or losses are included in the profit and loss account

(c) Investments

(i) To accord with the instructions of the Reserve Bank of India (RBI) relating to the valuation of permanent investments the Bank has changed its method of valuation as at March 31 1995 Investments in Government and other approved securities and bonds intended to be held to maturity are valued at the lower of cost or face value In case the cost price is higher than the face value such premium is amortised over the period to redemption Where the cost price is less than the face value such discount is ignored instead of being recognised as was done in the previous year

Had the Bank not revised its method of valuation, the value of investments and the net profit for the year would have been higher by Rs 279 000

(ii) Government securities not intended to be held to maturity are valued at the lower of cost or market value Market value is determined on the basis of market quotations at year end as indicated by the RBI

(iii) Treasury bills and commercial paper are valued at carrying cost

(d) Advances

Doubtful advances are identified by periodic appraisals of the portfolio by management and appropriate provisions are made The related interest on such doubtful advances is credited to an interest suspense account and not accrued to profits until received Advances are stated after deduction of provisions and interest in suspense

(e) Fixed assets and depreciation

(i) Fixed assets other than premises are stated at cost less depreciation

(ii) Premises at Bombay have been revalued at March 31 1995 and are stated at their market values determined by a Government registered valuer The surplus arising out of such revaluation has been credited to a revaluation reserve Depreciation on the revalued amount related to premises at Bombay will be provided in subsequent years

The Bank had revalued its entire premises at March 31 1993 by Rs 373 369 million and the surplus arising out of such revaluation had been credited to revaluation reserve An amount of Rs 79 000 (1994 Rs 6 086 million), representing additional depreciation arising out of revaluation has been transferred from the revaluation reserve to the profit and loss account

(iii) Depreciation is provided at 1 63 per cent per annum on the original cost of premises on a straight line method Depreciation is provided on all other fixed assets on the diminishing balance method at rates ranging between 10 and 25 per cent per annum Depreciation on additions made upto September 30 1994 is provided for the full year while depreciation on additions after September 30 1994 is provided for half the year

(f) Staff benefits

The Bank has created separate recognised funds for pension and gratuity benefits to employees Staff benefits to employees are based on actuarial valuation

(g) Net profit for the year

The net profit disclosed in the profit and loss account is after accounting for *inter alia* provision for income tax provision for doubtful advances and other necessary provisions

INDIAN BRANCHES

Auditors' Report on the Financial Statements under Section 30 of the Banking Regulation Act, 1949

We have examined the balance sheet of Banque Nationale de Paris – Indian Branches ('the Bank') as at March 31, 1995 and the related profit and loss account for the year then ended. Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have also obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our examination and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not, drawn up in accordance with Schedule VI to the Companies Act, 1956. The financial statements are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of the Bank as at March 31, 1995 and of its profit for the year then ended.

Furthermore, in our opinion,

(a) the transactions of the Bank which have come to our notice have been within its powers;

(b) the balance sheet and the profit and loss account are in agreement with the books of account, and give the information required by the Companies Act, 1956 in the manner so required for banking companies; and

(c) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books.

Some Notes on International Monetary Reform

Ranjit Sau

This paper reviews and reconciles three models of international monetary reform structuralist, monetarist and volatilist They are shown to be underdeterminate In a three market economy they each equilibrate only one market

There are three problems misalignment of currencies, volatility of exchange rates, and movement of hot money The situation requires flexible relative prices of goods, appropriate money supplies and a Tobin tax on currency transactions

Money demand functions have become unstable In the absence of global co ordination of national money supplies there is a case for an international agency to issue bond denominated in a basket of currencies and to engage in open market operation for world monetary stabilisation

I
Introduction

THE present world financial regime displays three major problems persistent misalignment of currencies volatility of exchange rates and abrupt massive movement of portfolio capital Eminent economists have made several proposals for reform Three classes of models are now available to address these issues they may be called structuralist monetarist and volatilist One may include Williamson (1985) and Krugman (1987) in the first category Mundell (1983 1987) and McKinnon (1984) in the second and Tobin (1978 1984 1994) and Eichengreen and Wyplosz (1993) in the third

In this context the world economy is best visualised as having three markets that deal with respectively goods capital and money[1] By Walras Law it is necessary and sufficient to establish equilibrium conditions for any two markets It will be shown here that the above-mentioned models are individually *underdeterminate* for each of them equilibrates only one market However since they focus on different markets at a time, they are mutually complementary rather than contradictory Accordingly this paper will make an attempt to conceptually incorporate the three classes of models into a general one

The structuralists see the need for adjustment of relative prices of goods, that is, the *real* exchange rate The monetarists as is expected assign prime importance to maintaining the appropriate *nominal* exchange rate by keeping the world money supply under control The third school is concerned about excessive fluctuation in exchange rate that induces speculative capital movements and thereby distorts economic signals In a perceptive, but controversial, scheme Tobin has suggested a 0 5 per cent levy on spot transaction of foreign exchange (including deliveries pursuant to futures contracts and options) to discourage quick round tripping which is essentially a zero sum game with dubious economic merit As a consequence of the tax the cost of long term capital may go up a little he concedes but such a rise will be much less than that of short-run speculative hot money So the Tobin tax in effect would increase the weight market participants give to long range fundamentals relative to immediate speculative opportunities' While the end result is accepted we shall show below that the cost of long term capital may not go up at all instead it may even fall as the dampening of speculative currency transactions would release *money* that would now be available for use in the 'real' sector of the economy This finding would strengthen the case for Tobin tax

Money demand functions are known to have been destabilised But the money supply process does not seem to have risen to the occasion there is no trace of any global co ordination for regulating the aggregate money supply *a la* McKinnon This paper will argue that there is a case for an international agency such as the International Monetary Fund (IMF) to issue bonds as close substitutes of national moneys and to engage in open market operation with them for world monetary stabilisation These bonds would be denominated in a basket of currencies

In what follows Section II reviews a structuralist model and Section III a monetarist model reconstructed by us Section IV deals with the main ideas of what we have called the volatilist school Section V attempts a synthesis of the three views

II
Target Zone

Exchange rates among the world's principal currencies have now floated for over two decades That is sufficient time to have established beyond doubt that floating rates show a great deal of variability and that the adoption of exchange rate flexibility does not resolve all balance-of-payments problems The demonstration that floating is viable has not been matched by a consensus that it is desirable Indeed, more and more observers have been alarmed by the violent swings in exchange rates – swings dramatically bigger than anything experienced by the Canadian dollar in the 1950s which provided the experiment with floating that, in turn nurtured support in the 1960s

Misalignment means a persistent departure of the exchange rate from its long-run equilibrium value while volatility refers to the amount of short run variability from hour to hour day to day, week to week, or month to month These two patterns of variability are distinct in nature, for rates can be volatile around an equilibrium level of competitiveness or stable over long periods while misaligned

Williamson (1985 14), the chief architect of the structuralist theory and policy, defines the fundamental equilibrium exchange rate (FLER) as one which is expected to generate a current account surplus or deficit equal to the underlying capital flow over the cycle, given that the country is pursuing 'internal balance' as best as it can and not restricting trade for balance of payments reasons" As a first step to quantify the FEER one has to measure the underlying capital flows that reflect real forces, namely, thrift and productivity A country with a high rate of investment (in reflection of a high productivity of capital) relative to the level of domestic savings will find it advantageous to import capital Conversely, a country with a high net savings rate and relatively few investment opportunities can benefit by using a part of its savings to acquire investment abroad The inflow and outflow of capital that results from such considerations will normally be beneficial,

to all, whether by augmenting domestic savings to permit a higher level of investment to be sustained, or by allowing savings to be invested abroad in a more productive way. But realisation of that potential gain requires that the capital flow be matched by a corresponding transfer of real resources. "That is, it requires a matching current account surplus or deficit, so that the overall balance of payments is in equilibrium. Thus current account targets are the mirror image of underlying capital flows" [Williamson 1985:23].

There are three factors that have a major systematic impact on current account: (a) terms of trade, (b) relative pressure of demand at home is against that in foreign markets, and (c) price competitiveness as indicated by the real exchange rate. Williamson writes:

current balance = f(terms of trade, relative pressure of demand, real exchange rate) (1)

He defines the terms of trade as the price of exports divided by the price of imports and the real exchange rate as the price of home-produced tradable goods divided by the price of competing foreign products. These two concepts he says would reduce to the same thing in a simple exportables-importables model of trade theory. But they are, he insists, very different in the real world. And in the absence of any published data of GNP gap on an internationally comparable basis, he assumes that the best figures to assess relative demand pressures would be the unemployment statistics.

Note that the terms of trade itself is a function of relative demand pressure and the real exchange rate. So, the current balance may be considered to depend upon only two variables, namely the relative pressure of demand and the real exchange rate. Given an estimate of current balance, and of the relative demand pressure which is cyclically normal, (1) can be solved for the real exchange rate. It is this value of the real exchange rate which is called the FEER, provided the predetermined current balance is set at the level dictated by 'underlying capital flows'. Williamson has devised a method for computing the FEER. With the FEER as a central rate he constructs a target zone, perhaps 20 per cent wide with soft margins. To succeed, the country must have a convincing alternative anchor to control inflation with appropriate macroeconomic policy. In this scheme the IMF is called upon to preside over international negotiations for drawing up a matrix of FEERs among major currencies and the associated target zones. The IMF will also supervise the consistency of countries' monetary-fiscal policies with their target zones.

The Williamson model, in our view, is underdeterminate as it leaves out too many variables unaccounted for. For instance, it ignores the rate of interest. When so much of international capital seems to be chasing interest rate differentials it is hard to abstract from such a crucial factor. This point can be clarified further if we take the excess of investment over saving as a measure of the 'relative pressure of demand'. Then (1) can be rewritten as

$$(X - X^*) = F\ \{(I-S),\ E\} \qquad (2)$$

where X is export, X* import, I investment, S saving, and E the real exchange rate. Recall that the terms of trade is a function of the other two arguments in (1). Sure enough it follows from the national accounts that

$$X^* - X = I - S \qquad (3)$$

is an identity. But that does not take away the significance of (2). Indeed, (2) is a meaningful statement, for it identifies a transmission mechanism for identity (3).

Although an economy must respect accounting identities, looking at these identities can never be the full analysis' [Krugman 1987:5]. Evidently (2) says that the identity between trade balance and the investment-saving gap is established through the mechanism of real exchange rate.

In order to formalise the structuralist viewpoint we introduce the following functions:

$$I = I(i) \qquad (4)$$
$$S = S(Y) \qquad (5)$$
$$X = X(E,) \qquad (6)$$
$$X^* = X^*(Y) \qquad (7)$$

where i is interest rate and Y income. Here (2), (4), (7) form a system of five equations with seven unknowns. To be sure, equations (4)-(7) are added by us to formally complete the structuralist model. Income Y may be specified exogenously at full employment level as required for internal balance. Even then the model will have one degree of freedom. Conceivably it can be closed with a liquidity preference function:

$$M = M(i,Y) \qquad (8)$$

where M is the money demand function. (The price index is set at unity.) And the supply of money is exogenous.

But it will soon transpire that (8) raises fundamental questions. Such a money demand function as (8) might have been valid in a regime of adjustable peg of the Bretton Woods era. Now with floating exchange rates it is no longer stable. There are evidence that, for example, the US money demand function of the form (8) had been unstable, having shifted once in the 1970s, and again in the 1980s [Hafer and Jansen 1991, Miller 1991].

McKinnon (1984.14) strikes a distinct note with his categorical statement. *With smooth functioning capital markets, little or no change in the 'real' exchange rate is necessary to transfer saving from one country to another* (italics in the original).' In each industrial country, he maintains, the central bank should de-emphasise purely national monetary indicators, such as interest rates or growth in domestic money, and increase the weight assigned to stabilising the exchange rate against a hard currency trading partner. Such an outward-looking monetary policy need not conflict with domestic macroeconomic goals. For the exchange rate is a robust indicator of changes needed in the nation's money supply to prevent unexpected inflation or deflation.

To stabilise the world economy, however, more is required of the monetary authorities of different countries. They have to co-operate to hold the absolute purchasing power of their currencies. Proper joint control over their aggregate money stock would dampen worldwide economic cycles. The analytical framework of this proposal can be put as follows. While McKinnon has estimated several equations with growth rates of variables we reconstruct his theory with the following equations using level variables:

$$Y\ P = Y(M,e) \qquad (9)$$
$$M/P = M(i,\ Y,\ e) \qquad (10)$$
$$e = P/P^* \qquad (11)$$
$$P = P(W,\ e) \qquad (12)$$
$$Y^*P^* = Y^*(M^*,\ e) \qquad (13)$$
$$M^*/P^* = M^*(i^*,\ Y^*,\ e) \qquad (14)$$
$$P^* = P^*\ (W,\ e) \qquad (15)$$
$$M + M^* = W \qquad (16)$$

where P is price and W is world money supply.' An asterisk means that the variable belongs to the rest-of-the-world. Clearly, (11) assumes the absolute purchasing-power-parity theory.

The central message of this model is that world money supply W is the policy-instrument for the target of exchange rate, which in turn ensures price stability. According to McKinnon, three major industrial countries – Germany, Japan, and the United States – should jointly regulate their aggregate money supply, consistent with the maintenance of absolute purchasing power of their national currencies.

The monetarist model, as formulated above, is underdeterminate. It has eight equations, (9)-(16), with nine endogenous variables: Y, Y*, M, M*, P, P*, i, i*, and e, given W as exogenous. Of course, another variable, say, M, can be taken as exogenous, and thus the model be closed.

McKinnon looks at the capital market while Williamson concentrates on the goods

capital inflow:

$$X^* - X = K \qquad (17)$$

Clearly, (3) and (17) are two sides of the same coin the trade balance is equal to the capital inflow, as well as to the excess of investment over saving In this sense the structuralist and the monetarist views are possibly complementary instead of being contradictory However then differences cannot be ignored For example, money demand functions (8) and (10) are not identical

IV
Casino Capitalism

Capital moves ever more freely across national borders both by direct business investments and by purchases and sales of financial assets However the capital flows needed to achieve efficient allocation of world savings are today a minuscule fraction of worldwide transactions in currency markets which are estimated to run at one trillion dollars a day The bulk of these trillions of currency exchanges are speculations and arbitrages seeking to make quick money on exchange rate fluctuations and on international interest rate differentials They contribute little to rational long term investment allocations Exchange rates are at the mercy of the opinions of private speculators commanding vast sums Their activities distort the signals that exchange markets give for long range investments and for trade

Interest rate arbitrage makes it difficult for national central banks to follow monetary policies independent of those of major foreign central banks Only a full fledged global currency union can prevent speculations on exchange rates but that is outside the realm of possibility in the foreseeable future So Tobin proposes a realistic second best alternative an international uniform tax on spot transactions in foreign exchange, including deliveries pursuant to futures contracts and option A 0 5 per cent tax on foreign exchange transactions is equivalent to a 4 per cent difference in annual interest rates on three-month bills a considerable deterrent to persons contemplating a quick round-trip to another currency The intent is to slow down speculative capital movements, and it would be too small to deter commodity trade or serious international capital commitments The revenue potential is immense, over $ 1 5 trillion a year for the 0 5 per cent tax

This proposal for international monetary reform is certainly not as radical at it may appear at first sight It has a close parallel in that of transaction tax on securities in stock market [Hubbard 1993, Ross 1989, transaction tax on securities. In Japan, for instance, such a tax raises $ 12 billion a year [Roll 1989, Stiglitz 1989] In the US the Bush administration studied a securities transaction tax as a possible means of raising revenue to help close the budget deficit [Kiefer 1990] Undoubtedly there are strong *economic efficiency* arguments for taxing short-term trading

Emphasising the volatility of exchange rate and the consequent rise of speculative casino capitalism Tobin has added a new dimension to the issue of international monetary reform The Tobin tax is not necessarily inconsistent with either the structuralist or the monetarist proposal However, by itself it is not a complete solution to the three major problems of the present world financial regime that we have noted above

V
A Synthesis

Let us recall that, by virtue of (3) Williamson focuses on the goods market and that in view of (17), McKinnon seems to concentrate on the relatively medium or long term capital market The short term money market with high frequency volatility is not under scrutiny of either It is Tobin who is concerned about hour to hour day to day, or month to month variation in exchange rates, and the enormous volume of speculative currency transactions that it generates The world economy has three markets for respectively goods, capital and money So a synthesis of Williamson McKinnon, and Tobin is not entirely implausible

One dividing line between Williamson and McKinnon is the controversy on real exchange rate versus nominal exchange rate as a means of international adjustment Krugman (1987 8) echoes Williamson when he writes 'In a world of perfectly flexible prices nominal exchange rate changes could neither produce nor facilitate changes in relative goods prices, and thus could have no role in the international adjustment mechanism ' His "one definite conclusion' emphasises the role of the real exchange rate *Reducing external imbalances requires real depreciation by deficit countries real appreciation by surplus countries* [Krugman 1987 24, italics in the original] However, it is followed by his "one strong presumption' *Nominal exchange rate changes can help facilitate real exchange rate adjustment* [Krugman 1987 24, italics in the original]

The real exchange rate, we know, is defined by

$$E = eP^*/P \qquad (18)$$

So, unless e and P*/P always move in the [illegible] would affect E. Following Krugman's "one strong presumption", therefore, one can say that the difference between Williamson and McKinnon on this score can be narrowed.

If trade moves by the real exchange rate as Williamson and Krugman hold, it is also true that capital is motivated by the nominal exchange rate The real return, r, of investment of one dollar in domestic asset is given by

$$1+r = (1+\imath)/(1+\pi) \qquad (19)$$

where π is the rate of inflation at home On the other hand, the real rate of return, r^*, of investment of one dollar in a foreign asset is given by

$$1+\imath^* = e_1(1+\imath^*)/(1+\pi)\, e_0 \qquad (20)$$

where e_0 of the exchange rate of the currency in terms of dollar in period 0, and e_1 is that in period 1 Interestingly, the foreign rate of inflation, π^*, does not appear anywhere in (19) or (20) The nominal exchange rate is there in (20), but the real exchange rate is not When an investor compares (19) and (20) for portfolio allocation it is the expected change in the nominal exchange rate that is of importance [Adler and Dumas 1983 930]. In a word, then, the nominal exchange rate cannot be ignored in any scheme of international monetary reform

We notice that (11) represents the absolute purchasing power-parity theory. Williamson is sceptical about this particular doctrine, which assumes an invariant real exchange rate Empirically the PPP theory does not seem to fare well Perhaps (11) should be modified into a softer version of the relative PPP theory No doubt, adjustment in the trade balance requires change in relative prices

We now turn to an apparent conflict between McKinnon and Tobin McKinnon (1984 15) believes in a 'basic complementarity between free commodity trade and unfettered capital flows", and he is opposed to the Tobin tax proposal which, he seems to suspect, would "disrupt international payments on capital or current account" On the other hand Tobin regards the incompatibility of pegged exchange rates, full international capital mobility, and national policy autonomy" as "a basic axiom of international economics" [Eichengreen, Tobin and Wyplosz 1995 162, Eichengreen and Wyplosz 1993 122] McKinnon calls for international co-operation in joint control over the world money supply so as to stabilise currencies at their respective purchasing power, while Tobin is a second-best solution proposes a small tax on currency transactions to discourage speculative bubbles Tobin is by no means against free flow of capital following productivity differences across countries He is concern

about the zero-sum (or even negative-sum) game of quick round-trips in currencies that pervade the money market Thus these two economists are dwelling at two different planes, and they are certainly not working at cross purposes

We shall now proceed to analyse some aspects of international finance that are relevant here Keynes (1930 217) divides the economy into two sectors industry and finance He defines *industry* as the business of maintaining the normal process of current output distribution and exchange and paying the factors of production their income' By *finance* on the other hand, he means the business of holding and exchanging existing titles to wealth including stock exchange and money market transactions speculation and the process of conveying current savings and profits into the hands of entrepreneurs Then, Keynes makes a remarkable observation Each of these two branches of business utilises a certain part of the total stock of money Finance indeed uses a large sum of money as an input into its business [5] The ratio of the money held as asset by finance and that by industry in the US is currently over 75 per cent while finance produces less than 5 per cent of the GDP [6] Finance creates as well as consumes money Evidently its propensity to consume money is rising fast over time This fact points to an interesting direction Should the activities of the finance sector be moderated without adversely affecting production in industry a vast sum of money may be released for use elsewhere Instead of creating liquidity problem as apprehended by Stiglitz (1989 110) [7] now more money given the total supply will be available to the real sector of the economy namely industry [8] So interest rate would fall contrary to the fear of Tobin that the long term interest rate might rise albeit mildly Of course McKinnon and Williamson do not address this aspect of the problem

Considering the enormous volume of currency transactions in response to exchange rate variations that we observe the money demand function in today s world can be better represented by

$$M/P = M(i \quad Y \quad e \quad \sigma_e) \qquad (21)$$

where σ_e^2 is the variance of e In a sense (21) encompasses (8) as well as (10) Once (21) is accepted a general framework emerges where all the three approaches structuralist, monetarist and volatilist can be reconciled

So long as the goods market capital market and money market have different speed of adjustment – presumably increasing in that order – volatility of exchange rate is inevitable [Dornbusch 1976 Krugman 1989] In other words σ is relatively large and partly exogenous, to begin with Now, high volatility of exchange rate, manifested in a large value of σ_e^2, creates scope for currency speculation The present-day practice of stop-loss speculation – as distinct from the Friedmanite stabilising speculation of always buying low and selling high – makes the exchange rate fluctuate even more rather than getting it steady [Summers and Summers 1989 268 69] 'That is to say, in the first place, speculation is triggered off by σ_e^2 and in turn, it raises the magnitude of σ_e^2 It is a self reinforcing destabilising process A large sum of money gets absorbed in this game of financial speculation leaving less for industry' So interest rate i rises and income Y falls In other words to the extent exchange rate fluctuations generate speculative currency transactions and use up money as an input in that process the real sector is deprived of a part of the money supply The Tobin tax would discourage quick round trips across currencies and thereby restore part of that money supply which is engaged in such financial business Furthermore reduction in the degree of uncertainty will be an additional favourable factor for investment decision in industry [Dixit 1992] [9] In any case bulk of the currency transactions evidently do not effect any cross border capital flow at all [Feldstein 1994]

The problem of proper alignment of currencies still remains Without fully subscribing to a strict monetarist position it can be said that the money supply does have a significant bearing on exchange rates There is yet no trace of international co ordination of money supplies to preserve purchasing power of currencies as visualised by McKinnon Under the circumstances it is possible to imagine a more practical second best solution An international agency such as the IMF can be called upon to assume the role of regulating the world money supply through the issue of bonds denominated in a basket of currencies Such bonds would be very close substitutes of money If the Tobin tax forces speculation to spill over into bond market [Gerber and Taylor 1995] these bonds may become useful instruments to moderate that market These bonds would not add to any country s money supply yet through open market operation by that agency the aggregate world money supply as well as the composition thereof can be optimised

Notes

[This paper was written during my visit at Washington University in Spring 1995 on leave from Indian Institute of Management Calcutta The generosity of the Department of Economics to me and the intellectual ambience greatly facilitated this project I am most grateful to David Kelly and William Newman for their help in many ways. I am responsible for the errors and the opinions expressed here]

1 Capital market trades in relatively long term financial assets of bonds and equities, while the money market deals with short term assets such as treasury bills and foreign exchange

2 Referring to this proposition Krugman (1987 15) says 'What is wrong with this argument should be immediately clear It confuses the question of whether a change in the savings rate will be reflected in a change in the distribution of world expenditure with the question of whether a change in that distribution necessitates a change in relative prices The latter question is a question about goods market not capital markets

Williamson (1985 14) notes that the concept of an equilibrium rate relates not to nominal exchange rate but rather to the real rate i e the exchange rate adjusted for inflation at home and in competitor countries

3 Our (9) is implied by McKinnon s (1984 42 43) equation (4 2) and our (12) by his equation (4 3) in ibid 56 His equations are in terms of growth rates we have expressed them in level variables

4 In an *analysis* model an instrument variable is exogenous while in the corresponding *policy* model it is endogenous [Tinbergen 1955]

5 Cf Usually it takes a lot of money to push around the $ 1 trillion a day foreign exchange market *The Wall Street Journal* March 10 1995

6 From the data of money holding as an asset in the flow of fund studies published by the Federal Reserve Board Felix et al (1995) find that the annual average ratio between the finance and the non financial business sectors holdings was 13 per cent during 1945 49 it steadily increased to 18 per cent 24 per cent 25 per cent and 29 per cent in the following four decades and remained at 29 per cent during 1990 94 This money consists of currency and checkable deposits that corresponds to the Fed s M_1 If money is defined to include also time and saving deposits (which resembles Fed s M) then the steep rise of the ratio becomes even sharper from 13 per cent in 1945 49 to 16 per cent 21 per cent 38 per cent and 68 per cent in the following four decades and to as much as 77 per cent during 1990 94

The US Department of Commerce has estimated that finance and insurance generates 4 5 5 0 per cent of GNP and occupy about 5 per cent of the employed labour force They account for 7 5 per cent of after tax corporate profit If the inputs of goods and services purchased from other industries are included Finance and insurance use about 9 per cent of the GNP [Tobin 1984 284]

7 A turnover tax leads to a thinner market Thinner markets have a bigger spread

between buying and selling prices, and in that sense are less liquid. Buyers and sellers do not in general arrive in the market at the same time. With thinner markets, it may take a longer time for, say, a seller to be matched up with a buyer. Market makers make the market by buying from the seller, then holding the security in inventory until the buyer arrives. The market makers need to be compensated for performing this function both for the capital which is tied up and the risks which are borne [Stiglitz 1989: 110].

Should the market become thinner with the Tobin tax it would tend to be less liquid *ceteris paribus*. But other things would not remain the same. To the extent the volume of turnover is curtailed the total requirement of liquidity (money supply) may indeed decline.

8 Felix et al (1995) have found with the US data over the period 1945-94 a *parabolic* relationship between the relative size of the financial sector and the growth rate of the real sector of the economy. The relative size of the finance sector is measured by the ratio of money held as asset by 'finance' and that by 'industry'.

9 In considering the relationship between speculation and volatility it is helpful to distinguish between two types of strategies. The first type which might be called 'value investing', involves *negative* feedback. Traders who purchase stocks on the basis of stock prices in comparison with some relatively stable estimate of fundamental values will normally find themselves selling when prices rise and buying when they fall. This strategy will tend to reduce volatility by returning stock prices to the fundamental value of the underlying company. It resembles the gross substitutability condition for stability of a Hicksian general equilibrium model of commodities.

There is another situation where stabilising negative feedback will occur when traders rebalance their portfolios, following a risk-reducing strategy of buying and selling equity in order to maintain specified fraction of their assets in the form of equity versus debt, and when they trade against the market on the theory that the market typically over-reacts to news in either direction.

The second type of trading strategy involves *positive* feedback. Traders following such a strategy buy when markets rise and sell when they fall. Such positive feedback trade tends to increase volatility. Strategies based upon the slogan 'the trend is your friend', the placement of stop loss orders, and the use of certain complex dynamic hedging strategies to provide 'portfolio insurance' all contribute to the destabilisation of market prices.

The negative feedback strategy does not require trading frequently—portfolio assets are expected to earn high returns in the course of a month or more likely years, not in days or weeks. By contrast, frequent trading is the essence of the positive feedback strategy.

Perceived in this light, Summers and Summers (1989: 269) conclude "as an empirical matter the evidence [of stock price movements] does suggest the possibility that trading itself may be a source of volatility". They also remind us "Indeed, Keynes was at pains to argue that excessive liquidity actually encourages destabilising speculation".

10 Frankel (1979) argues that the existence of forward markets, under certain conditions enables a multinational firm to diversify all exchange risks, see also Broll (1994), Broll and Zilcha (1992, 1995), and Kawai and Zilcha (1986). All such models assume an exogenously given risk free rate, such an assumption may be reasonable for a firm. In the case of a national macro-economy, or the world economy however there is no such exogenous rate.

Searching for New Development Strategies

Challenges of Social Summit

Ignacy Sachs

A widespread social crisis in different forms and with different degrees of intensity is affecting third-world countries, eastern Europe and the former Soviet Union (today known as countries in transition), and even industrialised countries. The indiscriminate opening of the economies of the South has created the risk of intensifying the process of the dualisation of the economy and society. The countries in transitions face the three fold challenge of stabilising their economies, creating institutions for the functioning of market led economies and of undertaking a thorough restructuring of their productive capacities. The most important challenge in the coming years will be that of the renewal of development thinking and a search for new development paradise.

THE United Nations has convened a World Summit for Social Development in Copenhagen in March 1995 a symbolic date as 1995 marks the 50 anniversary of the dropping of the atom bomb on Hiroshima, the end of the second world war and the establishment of the United Nations. The Summit provides a special opportunity to draw up a balance sheet both positive and negative of the past half century and ask how it may be possible to influence the course of events over the next 50 years and achieve results that will be more satisfactory in terms of the two essential goals of the United Nations peace and development.

The minuses of the balance sheet outweigh the pluses since the period following the second world war has been marked throughout by a succession of bloody conflicts waged on political ethnic even religious bases and by institutionalised violence numerous violations of fundamental rights the imposition of authoritarian regimes and sham democratic practices.

During the cold war the balance of terror between the two superpowers averted catastrophes such as a world conflict and consequent nuclear holocaust. The end of the Cold War has not permanently removed this danger but considerably reduced its probability. At the same time there has been a big increase in the number of local conflicts. Our century is coming to a close with a new wave of genocidal acts in Africa and in the very heart of Europe which is thus experiencing a revival of the horrors of the two world wars the extermination campus and the Gulags.

At the same time there have been two major upheavals at the geopolitical level firstly, the decolonisation and emancipation of colonised and dependent countries [1] and secondly, the collapse of real socialism in 1989 followed by the break up of the Soviet Union. To this must be added the end of the apartheid regime in South Africa in 1994 and the still uncertain hopes of lasting peace in the Middle East.

Decolonisation and the collapse of real socialism are two irreversible historic turning points with consequences and sequels that continue to weigh heavily upon our present world. Beyond exaggerated simplifications that seek to replace the bipolar pattern of the Cold War by a so called shock of civilisation it must be said that the search for identity is a fertile breeding ground for the rise of dangerously anachronistic forms of ethno nationalism and fundamentalism. The Polish historian Witold Kula (1960) defined underdevelopment as a *coexistence of asynchronisms*. From this viewpoint we may speak of a fairly widespread process of involution or underdevelopment that is simultaneous with the manifestations of globalisation whose economic and social impact in its differentiated forms both positive and negative calls for in depth assessment. To cast a uniformly positive light on globalisation processes would smack of a theology of the market and cannot be part of any scientific analysis.

The period that we have just lived through has seen an unprecedented expansion of technological power the production of goods and services as well as trade. Consumption patterns and lifestyles have been profoundly transformed for a majority of the inhabitants of industrialised countries and a minority of those of the third world countries, but the economic improvements indicated by growing statistical average have not been broadly distributed. In as rich a country as France, a societal fracture is now creating a divide between the two thirds constituting the winners and the third who are the losers and are increasingly excluded from consumer society and deprived of their (nonetheless fundamental) right to work. In other words, France too has its 'Fourth World' and the South is present in the North. The privileged minority in the third world countries, on the other hand form a presence of the North in the South without there being any territorially demarcated enclaves. The North and the South are in contact and are interpenetrating each other, especially in the big cities.

The world has shrunk because of the improvements in transport and to an even more significant extent, because of the communications revolution. These technical advances are the basis of the already mentioned manifestations of globalisation that are occurring at an uneven pace in fields as varied as those of finance economics technology and culture.

We are living through a period of the decoupling of the financial economy from the real economy [Drucker 1986] the consequence of which is the establishment of circuits of financial speculation that drain away capital which could otherwise have financed productive investment and helped create jobs. Transnational firms have become the main agents in the economy and in trade so much so that production and international trade statistics in the form of national aggregates have been made obsolete.

The media everywhere are propagating an identical picture of the good life based on unbridled consumption and the Hollywood dream. A small minority of men and women travel with ease all over the planet, to the extent that tourism and travel have become a major sector of the economy [3]. However, the majority of the inhabitants of our planet continue to live as if they were *glebae adscripti*. There is a striking contrast between the restrictions on the international mobility of labour and the increasing mobility of other factors of production.

Science and technology are very imperfectly controlled. Prometheus got entangled, to borrow a metaphor from Jean-Jacques Salomon (1984) [4]. The destructive power of technologies whose use continues to be subordinated to the search for short-term financial and economic profit has furthermore brought about the deterioration of the environment, the wise management of which has become an imperative for the world as was seen at the Earth Summit in Rio de Janeiro in 1992.

Above all, scientific and technical progress has not kept its promise of widespread well-being for the whole of mankind. In 1930,

Keynes expected that mankind's economic problem would be definitively resolved within a century Man, for first time since his emergence on our planet, would then be able to face his real, his permanent problem

How to use his freedom from pressing economic cares, how to occupy the leisure which science and compound interest will have won for him, to live wisely and agreeably and well" [Keynes 1972 328]

We henceforth have the technological ability to provide each and every individual with a reasonable degree of material comfort According to World Bank data the world's average per capita income was nearly $ 4 300 in 1992 By comparison the per capita income in the UK was $ 4 593 in 1900 and that of the US at the same period was $ 4 096 [Maddison 1994] However the inequality that characterises the distribution of income among different countries and within each country divests this statistical average of any meaning In 1991 the richest fifth of the world s population appropriated 84 7 per cent of the world s GNP while the share of the poorest fifth was limited to 1 4 per cent Within a span of 30 years the disparity between the incomes of these two extreme groups went up from 30/1 to 60/1 Even more significant is the fact that in modern societies exclusion is gaining ground over exploitation The rich no longer need the poor This is very probably why they tend to forget them [5]

The increasingly unequal distribution of the products of technical and economic progress arises out of faulty social and political organisation and not out of any scarcity of goods It throws up a challenge to the political establishment which is incapable of making efficient use of technological power [Ruffolo 1988] We are here at the very heart of the notion of maldevelopment [Sachs 1984] which is not incompatible with economic growth even at high rates The fact of the matter is that growth and development are not synonymous So long as huge social disparities persist, growth will be certainly a necessary but in no way sufficient condition of development, for the distributive and qualitative aspects cannot be overlooked It is false to say that the exorbitantly high social and ecological costs of certain forms of economic growth are the unavoidable 'ravages of progress'

Progress for Whom?

This question will be touched upon at the Copenhagen Summit in the discussion of the three points on its agenda the struggle against poverty, social integration and the creation of productive jobs It is neither acceptable nor necessary that financial and economic progress should be paid for by structural unemployment and underemployment which are leading to increasingly widespread manifestations of social exclusion and poverty

The way in which the agenda for Copenhagen has been structured, and this was also the case with the Earth Summit in 1992, is an implicit rejection of the economicist theories that make growth the central if not the only goal It also tolls the knell of the belief that the benefits of economic growth will almost automatically spread to the whole of society In the words of Louis Emmerji (1994), no one can question the fact that economic growth is in the long term effective in achieving social goals and combating poverty but three to five generations may be necessary to reach this goal In other words, the transition period will be humanly unbearable and politically irresponsible

This is why it is necessary to deal with the five themes of peace economy environment justice and democracy all at once in taking social conditions as the starting point for efforts towards development ' The present text is far more limited in its aim It seeks only to analyse those aspects of the problem of development that appear to merit special attention In the following pages after examining the world wide social crisis with special emphasis on integration into the production process through employment and self employment we shall look at the search for new paradigms of development through the following issues going beyond economicism the need for a universal axiology the relations between the economic the ecological and the social the democratic regulation of mixed economies the redefinition of the role of the state new forms of partnership among the different social sectors science and technology in the service of social development and reforms in the international system

The Copenhagen Conference will be faced with a widespread social crisis which in different forms and with different degrees of intensity is affecting (with few exceptions) the third world countries eastern European countries and the former Soviet Union (today known as countries in transition), and even the industrial countries

In the third world, the poor, who are the victims of the under-development of production capacities have been joined by the new poor who are the victims of a mimetic concept of modernity built by means of a transposition of the latter techniques coming from the industrialised countries It is true that there is need for a selective use of such techniques However, the indiscriminate opening up of the economies of the South creates the risk of intensifying the process of the dualisation of the economy and society with a resulting increase in the numbers of those excluded and a threat, in the long run, of social apartheid

The countries in transition have to cope simultaneously with a threefold challenge. They have to stabilise their economies, create from scratch all the institutions necessary for the functioning of market led economies and finally, carry out a thorough restructuring of their productive capacities in order to increase their efficiency, competitivity in international markets and performance in the management of the environment In many respects therefore, the problems of the countries in transition resemble those of the countries of the third world [7]

A transformation of this nature cannot be achieved without high social costs However, the choice of a strategy based on the illusion that it is possible to achieve the instant establishment of capitalism and the sovereign rule of the market economy seems to have increased these costs and furthermore, to have prolonged their existence beyond what is necessary The worsening of social relationships the deterioration of health, education and welfare services, the emergence of a high level of structural unemployment which will be difficult to absorb the vulnerability of the countries in transition to the shock of a far too sudden opening up of their economies, the permissivity in regard to the practices of savage capitalism are all so many factors that weigh down on the negative side of the balance sheet of the great transformation, at least for the time being

The most astonishing aspect of the social crisis is the deterioration of the condition of the industrial countries after decades of fast economic and technical progress It might almost be said that we are seeing these countries slide into a third world status. Indeed the intellectual tools that were earlier fashioned to study the economic and social dualisation of the post colonial countries and account for the phenomena of social exclusion and spatial segregation have returned in a big way to the heated debate, now going on in most of the industrialised countries Unemployment, the precariousness of jobs and the various forms of exclusion resulting therefrom have become endemic No one is hoodwinked by the euphemism two speed society Marshall Wolfe (1994) distinguishes several forms of exclusion relating to the means of livelihood, social services, protection services and security networks consumer

culture; the process of making political choices; the bases of popular and solidarity organisations and finally the capacity to understand what is happening.

Events therefore are all running counter to what the optimistic theories of development led us to believe. What we are witnessing is not the disappearance of the traditional sector by the gradual transfer of its redundant labour force to the modern sector but the expulsion of surplus workers from the modern sector into the 'informal', 'grey' or quite simply 'black' sectors of the economy, or even their pure and simple reduction to marginal status, condemning them to the pangs of enforced idleness and to the status of dole recipients—in some cases from the cradle to the grave.

At a time when we have greatest need of it, the welfare state is under attack and is even being partially dismantled on the pretext of its excessive cost and bureaucratic unwieldiness and the supposed efficiency of alternative formulas, postulating the commodification of social services. It is true that the methods by which welfare states function must change. However, it must not be forgotton that they are the only truly positive contribution that Europe has made to the world in the 20th century, being the result of a century and a half of social struggle, and also of competition with real socialism at a time when the latter still enjoyed credibility in the eyes of a significant part of Western public opinion.

More than ever, the goals of full employment and of comprehensive and adequate social protection represent a basic part of the European identity. Instead of defending welfare entitlements and other social rights in their present form, it is necessary to place a thorough reform of the welfare states on the agenda without, in any way, thereby relieving them of responsibilities and relying solely on market mechanisms. The direction that this reform should take is clear Societies have to be helped to take responsibility for themselves, with the assistance of the state. This must be done through a search for many varied forms of partnership for the production of social services between users, the civil society represented by associations and the other components of the social economy (co-operatives and mutual benefit societies), administrative bodies at all levels from the local to the national and, finally, business firms.[8]

The three points on the agenda of the Copenhagen Conference are closely interlinked. It would seem however that, logically, priority should be given to the implementation of proactive policies that strike at the very root of the problem by integration into the productive process through employment or self-employment. Policies of assistance in which the poor are cared for are certainly necessary, given the size and urgency of the problem of poverty. However, such policies by themselves will not bring lasting solutions. The excluded receiving assistance will continue to be excluded so long as they have not found a place in the economy.

Similarly, social integration which brings numerous cultural factors and forms of social organisation into play depends to a major degree on the capacity to provide all the different components of the population, beyond their social, ethnic or religious differences and their level of education, with the conditions that will enable them to earn a decent livelihood by their work.

The population explosion is often presented as the main cause of the acute underemployment and unemployment prevailing in the countries of the south. However, this thesis needs to be qualified by a closer look at the population-development loop. So long as the populations of the south have not acquired security in terms of food and social protection, have high infant mortality rates and continue to receive inadequate education, especially in the case of girls, it will be difficult to convince them that birth control policies are well-founded. Their partial rationality limited to the family unit, will continue to run counter to global rationality. The demographic transition cannot be achieved without social development based on integration into the productive process.

The priority that must be attached to the problem of employment and self-employment is all the greater as enforced idleness[9] is an irreversible form of destruction of human life, for time lost can be neither stored nor retrieved. The real challenge is to break the dynamic chain of unemployment and exclusion and replace it with the dynamics of employment [Brunhes 1993]. The scale of the problem can be seem from reading of the available statistics and projections.

The ILO has prepared projections of the economically active population (EAP) for the period 1985-2025, which we shall use to assess the magnitude of the number of jobs that have to be created and are necessary to absorb newcomers to the job markets in the present decade and the next two decades without taking account of the need to absorb existing unemployment [ILO 1986].

Indeed, as Table 1 shows, from 1990 to the year 2000, the active population should increase by 389 million and then, in the first million and 35.15 million respectively. Most of the new jobs to be created are likely to be in the less developed regions: 92:5 per cent of the total increase between 1990 and 2000, 97 per cent between 2000 and 2010, more than 100 per cent between 2010 and 2020, since during this latter period the EAP of the most developed regions will be reduced by 400 million.

The data do not take already existing unemployment and underemployment into account. About 30 per cent of the world's active population is in this condition according to UN estimates. The absorption of this section would require the creation of very many additional jobs. According to the International Commission for Peace and Food, to ensure full employment, it would be necessary to create about a billion new jobs during the present decade (1994:71).

According to the ILO data, the condition of the most developed regions appears to be comfortable at first sight since the annual growth rate of their EAP will be barely 0.49 per cent during the present decade and 0.34 per cent during the next decade. Creating some three million jobs a year should not raise any problems given that, according to World Bank data, gross investment in high-income countries in 1991 amounted to $ 3,750 billion (as compared with $1,010 billion for the rest of the world).

However, this does not at all represent the true picture. Instead of creating jobs, investment in productive capacities is tending rather to replace men by machines. In many branches of industry, the relationship between growth and employment is becoming a negative one. The race for competitivity is resulting in rates of growth in productivity that are higher than rates of growth in production. To take only one especially telling example, between 1980 and 1992, Spain doubled its GDP without creating a single additional job. We are therefore in a structurally novel situation that is the result of a combination of several factors. We shall mention four of them.

The facts have belied the optimistic expectations of those who, in preaching the virtues of the permanent race for technological innovation [Riboud 1987], promised a growth in employment in the modern services sector that would exceed the loss of direct jobs in factories through automation. Recent advances in office automation point to the same trend towards replacing men by machines in the tertiary sector.

TABLE 2

	The Economical	The Social	The Ecological
1 Savage growth	+		
2 Socially benign growth	+		
3 Environmentally sustainable growth	+		
4 Development	+		

The link between production and employment is loosening and intensive growth is taking precedence over extensive growth. As far as France is concerned, E Malinvaud expects a growth rate of 3 per cent in the long term accompanied by an annual 1 per cent increase in employment and an annual 0.5 per cent drop in unemploment (Interview in *Le Monde*, November 16, 1993). This major trend in the present phase of technological development goes hand in hand with a decoupling of the real economy from the financial economy whose explosive expansion marks the end of the 20th century [Drucker 1986]. As already pointed out, the capital that could have been invested productively is being diverted by the lure of spectacular gain to the gambling tables of the 'global casino' that the financial markets have become. The sterilisation of this capital is slowing down the growth of the real economy.

The industrial societies, dominated by the ideology of consumerism, have been unable to take advantage of the growth in productivity to carry out the drastic reduction of working time, which is a social necessity. It is true that whereas work took up 200,000 hours in the lifetime of a Frenchman at the end of the 19th century, it now takes up only 70,000 hours [Rigaudiat 1993]. However, the objective conditions for accelerating this trend now exist. From Kropotkin to Gorz and Illich, not to mention Betrand Russell and Keynes, many thinkers have made proposals for a revolution of liberated time anda reorganisation of society enabling people to work less in order to procure work for all, to paraphrase the title of a recent book [Adret 1993].

The present crisis seems to favour a resumption of this debate whose ethical and cultural dimension go beyond the technical modalities of an initial reduction of working time. The implementation of a policy of the equitable redistribution of the socially needed work calls for a genuine cultural revolution and for profound institutional changes.[10] The situation can, however, be improved through a modification of the fiscal and parafiscal policies that increase the cost of labour through social security contributions. These contributions could be financed in other ways, for example by a tax on equipment or by an appropriatly modulated VAT.

The recent trends in economic thinking dominated by neo-liberal theories explains the inadequacy of employment policies and, more generally, of public policies concerning development.

The decline and then the collaps of real socialism have been interpreted as the green light for returning to an unbridled form of capitalism whose success is measured by rising stock exchange indexes and volumes of profits, and no longer by the creation jobs. Stringent rules on adjustment of macro-economic and monarchy balances and on liberalisation have been laid down by the IMF and the World Bank, protecting the creditors of the debtor countries. Notwithstanding disclaimers by the IMF and the Bank, the austerity policies dictate heavy sacrifices on the part of the most underprivileged social classes.[11] Deregulation, privatisation and budgetary austerity have been used, with the pretext of curbing the excesses of statism, to restrict the field of action of states and buttress the position of large private companies, both national and foreign. The same strategy, barring a few details, has been proposed for the countries in transition towards the market economy.

The failure of the industrialised countries to reduce unemployment despite the financial resources at their disposal provides a measure of the scale of the challenge facing the less developed countries. During the present decade, they will have to create 12 times as many jobs merely to absorb newcomers to the job market with a gross fixed capital formation that is four time smaller! One immediate conclusion needs to be drawn. It is quite unthinkable that the models of the North can be reproduced in the countries of the south No longer can these countries, in the name of competitivity and of integration into the global economy, accept the infernal pace of 'creative destruction' that even the richest countries are unable to keep up with.

And yet this is the path chosen by the elites of the third world. We can understand the vehemence with which Kothari (1993) has criticised them in his already quoted book, where he proposes that India should take an approach to development based on social empowerment, decentralised planning and job promotion, rather than on growth as such, an approach based on the development of the countryside and the expansion of the internal market rather than on giving excessive priority to exports.

Of his proposals, we would single out the emphasis laid on the need to consider employment as a key variable in development strategies. A finely tuned employment policy, prepared on the basis of field data, would therefore appear to be an essential part of the public policies to which we shall return further below.[12] While recognizing the seriousness of the situation, we feel that there is room for manoeuvre in this field, provided that a thorough review is made of the goals and methods of development. When Alice in Wonderland politely asked the Cheshire-cat to please tell her where she was to go from the place she was in, the cat replied: "That depends a great deal on where you want to get to".

The already cited report by the International Commission for Peace and Food (1994), rightly considers the search for new development paradigms to be among the major priorities of the present time. East European statism has collapsed but there is no place for undiluted capitalism either. "Rather than searching for a victor and vanquished, the urgent need is to find a successor that combines and synthesises the enlightened values of both system" (p 154). The well-being of all individuals should determine social policy and the market economies should undertake to guarantee the right of every citizen to employment.

The Report adopts the UN Secretary General's view that the most important intellectual challenge in coming years will be that of the renewal of devlopment thinking. The world had sufficient experience and information to formulate an integrated theory of development seen as a social process centered on man as a whole and on all men. The Social Summit should be set the ball rolling.

The task is a difficult one. It requires firstly, recognising the fact that there is a widespread social crisis which, as we have already seen, affects in different ways and with different degrees of intensity, every group of countries, including the industrialised ones.

> Comprehensive, human-centred theory of development An important shift in thinking has taken place from regarding development primarily in terms of economic growth to greater emphasis on the human welfare and development of people. But development is not only a set of goals or material achievements - it is a social process by which human beings progressively develop their capacities and release their energies for higher levels of material achievement, social and cultural advancement, psychological fulfilment. A new theory is needed that focuses on the dynamic role of information, attitudes, social institutions and cultural values in the development process. An international effort should be initiated at the forthcoming UN Social Summit to evolve a comprehensive, human-centred theory of invidiual and social development that will lead to the formulation of more effective strategies to accelerate the development process From *Uncommon Opportunities: An Agenda for Peace and Equitable Development*, Report of the International Commission on Peace and Food, London, Zed Books, 1994:201.

Going beyond Economicism

Furthermore, this task makes it necessary to go beyond economicism which is still the dominant thinking and is expressed by the explicit or implicit acceptance of the trickle-down theory. According to

NATIONAL INSTITUTE OF PUBLIC FINANCE & POLICY
NEW DELHI

Applications are invited for the temporary posts of **Consultants** at various levels for UNDP and Ministry of Environment projects. The consolidated remuneration of Rs. 5000 to Rs. 8000 per month will be offered depending on qualifications and experience.

Essential Qualifications: A high second class Master's Degree in Economics with interest/specialisation in Public Finance/Enforcement of Taxes (Central/State)/Environmental Economics/Transport Economics and competence in handling computers and statistical packages.

Preferred Qualifications and Experience: Candidates having a M.Phil or Ph.D or 3-5 years of research experience in the economics and administration of Direct Taxes/Commodity Taxes/Panchayat Finances/environmental health/environmental aspects of transport, and familiarity with recent literature in their field of specialisation will be preferred.

Other things being equal, candidates belonging to Scheduled Caste/Scheduled Tribes will be given preference.

Applications indicating qualifications and experience supported by true copies of certificates and testimonials should reach the Secretary, **National Institute of Public Finance and Policy**, 18/2, Satsang Vihar Marg, Special Institutional Area, New Delhi – 110067 within 15 days from the date of the advertisement. **Candidates must specify on the top of the application, the area of their interest/specialisation.**

CHICAGO HUMANITIES INSTITUTE

The Globalization Project at the University of Chicago is a three year program established to promote an international research network on the cultural, legal and aesthetic dimensions of globalization, with a focus on urbanization processes, migration and global media. During 1995-96, the Project's theme is **Rights and Representation**. The Project anticipates awarding a Senior Fellowship (three to four weeks) of upto $4,500 and a Post-Doctoral Fellowship (three to four months) of upto $6,000, to cover roundtrip airfare and stipend. Both fellowships are residential. The Project especially encourages applications from scholars based in Latin America, Africa, The Middle East and Asia. Successful applicants will make one formal presentation of their research and participate in the Project's activities. All applicants should submit a c.v., a published article, and a research statement (1-3 double-spaced pages). Applicants for the Post-Doctoral Fellowship should also arrange for three letters of recommendation to be submitted. **The deadline for applications is September 15, 1995.**

Address all material to: The Globalization Project, Chicago Humanities Institute, The University of Chicago, 1100 East 57th Street, Chicago IL 60637, USA Tel: (312) 702-8274; Fax: (312) 702-0775.

theory, it is the economy that rules. What needs to be done essentially therefore is to ensure the macroeconomic controls that enable reasonable growth, and the rest will follow of its own accord The benefits resulting from this growth will ultimately flow into the entire fabric of society and spread to the very base of the pyramid The agenda of the Earth Summit and, even more so, that of the Social Summit implicitly deny the trick-down theory, but the practice of many governments continues to be based on this theory and the most extreme neo-liberal currents of thought preach it openly

Another element of mainstream thinking overestimates the importance of competitivity, which has been raised to the status of a real ideology, based on a superficial theory of globalisation, presented purely in its positive aspects as if increases in financial, commercial and technical flows always occur in such a way as to benefit each and every partner including the weakest The concept of interdependence is often pushed to the fore in order to avoid any analysis of the degree of asymmetry, even domination, that exists in the relationships between strong partners and weak partners The Report of the Lisbon Group (1993) has come out strongly against the ideology of competitivity and has demonstrated its limits [13]

As for globalisation, we may note first of all that it is occuring unequally in different fields As historians have shown, the microbial unification of the world took place before the birth of the world market

We have already pointed out that the financial markets, working round the clock and seven days of the week, put in motion monetary flows quite out of proportion to the needs of the real economy The lure of easy, albeit risky, gains ultimately sterilises a substantive part of the resources that could have taken the form of productive investment It is currently estimated that the transactions made on the international money markets amount to a thousand billion dollars a day James Tobin's ingenious proposal, made as early as 1978, for taxing currency transfers at a rate of 0 5 per cent, would bring in more than $1,500 billion per year which could be used for international purposes Despite the obvious advantages of this prposal and its adoption by the influential UNDP *World Report on Human Development* (1994, p 75), there is no great likelihood of its being seriously looked at in Copenhagen, or elsewhere

Globalisation is taking great strides in the field of communications Identical television programmes are reaching all corners of the globe with a tendency towards a homogenisation of culture that is raising problems [Ortîz 1994] and even, more seriously, paving the way for a telecracy, a term invented by the French daily, *Le Monde*, in the aftermath of [illegible] election victory in Italy

The post-war period was marked by an expansion of trade and technological exchanges that was greater than the economic growth rates, and therefore also by an opening up of economies Once again, the picture needs to be qualified, since the degree of opening differed greatly from one country to another In particular, continent-sizes countries compensate for relatively low level of foreign trade by internal trade The place of the US in world trade is a result, not of a high degree of opening up, but of the size of its GDP

Certain ideologists of globalisation like John Naisbitt (1995) strive to show that the advance of globalisation gives an increasingly significant advantage to networks of small partners which enjoy a degree of flexibility that states and large firms do not possess There is some truth in Naisbitt's approach whenhe speaks of the retreat, in terms of identity, of the nation state towards what he calls 'the tribes' According to him one of the aspects of the global parodox is precisely the fact that the more universal we become, the more tribal we act (p 24) In the course of his explanation, the author underestimates the increasingly dominant role in the world economy, of the transnational corporations which are constantly increasing their power while the influence of States gets blurred and while international institutions have practically no way of controlling the practices of these companies

The ultimate thrust of his book lies, however in its unexpected extrolling of the advent of the age of individualism marking the end of politics as we know them, and hence in its minimising or even its elimination of the state s responsibility with respect to its social functions, notably as regards employment 'Now with the electronics revolution, both representative democracy and economies of scale are obsolete Now everyone can have efficient direct democracy" (p 47) The communications networks are supposed to take care of this

Yet, as Oliver Dollfus (1994) has stressed, the system that produces the world space creates forms of participation in as well as exclusion from the process of globalisation [14] Furthermore, globalisation is based on a vision that underestimates the variety of historical experiences and the plurality of humankind This is why in most places it is arousing its contrary, namely the development of particular issues In reality, as Bertrand Badie [1994, see also Badie and Smouts 1992] has persuasively shown, we are moving towards a New World Disorder because of a threefold break markedby globalisation, the crisis of the nation-state and the end of bipolarity Today's forms of opposition are no longer ideological but cultural The present-day world is characterised by the failure of three fetish concepts of modern international relations sovereignty, territoriality and security Insofar as nationalism is being weakened in favour of micro-communalism and macro-social forms of solidarity (inter alia of a religious type), the 'international' order enters a stage of crisis

Another characteristic of dominant economic thinking is that it considers itself to be universally valid This actually gives it an ahistoric and atopic character In practice, this amounts to denying a field proper to the theories of development and to maintaining, in the face of all evidence to the contrary, that the mimetic transposition of the experiences of the industrial countries to the rest of the world constitutes the right path to development The prohibitive social costs of the structural adjustment policies applied uniformly throughout the planet are once again denying this claim without there being any change in the practices of the international organisations based on the 'Washington consensus' [15]

The plurality of the paths is more than ever on the development agenda The development strategies must take account of certain specific characteristics common to several countries (for example large countries and countries rich in natural resources as opposed to small countries and countries poor in natural resources) thus making it possible to establish certain heuristic typologies [16] On the other hand, they must account for the singular features of each country

— the historical and cultural context, it being necessary to understand development as a dynamic process [17]

— the ecological context, since climatic and biological diversity, when well interpreted, yield a potential of resources that can be used for development without destroying the capital of nature, the link between natural diversity and cultural diversity being very close After all, an important aspects of culture is the knowledge that a society has of its natural environment,[18]

— finally the institutional context, in the broad sense of the term, reflecting the organisation of human society

In the face of the multiple paths of the past, present and future, what can be expected of a theory of development other than a comparative analysis of accumulated experiences, both positive and negative, capable of stimulating the social imagination without delivering ready made models for all that

We feel that a normative discourse is indispensable in order to specify a mobilising *national project* that is based on an explicit axiology, recognising the living burden of the past but oriented towards the future A project of this kind will accessorily have a

very important function of serving as a criterion for the assessment of policies proposed and of paths taken. The notions of rationality and efficiency lose their precision when there is no strategic planning oriented towards the medium term and the long-term. Without repeating, yet again, the errors of comprehensive planning made by the centralised economies it is necessary, on the contrary, drawing upon all the lessons of past failures, to undertake flexible dialogue-based,[19] context-related and contractual planning.

Search for a Universal Axiology

In a world where, as we have seen, particular cultural identities are assuming increasing importance, the question is whether it is possible to set up an axiology on the basis of certain universal principles.

Our answer would be affirmative, in the light of the debate inaugurated by the Stockholm Conference in 1972 and resumed by the Rio Earth Summit in 1992. We feel that development, in the full sense of the world, should have a social purpose justified by the ethical postulate of intra-generational solidarity and equity, taking the form of a social contract. While the social disparities between nations and within nations have only increased, everything needs to be done to reduce them. This requires privileged groups to ask the question: "how much is enough?"[20] The development of man as a whole and of all men can become widespread only through the building of a civilisation of being in a balanced sharing of having to quote. L J Lebret.[21] By contrast, the extrapolation of the current major trends can only accentuate the drift towards social apartheid.

Furthermore, development requires ecological prudence in the name of inter-generational solidarity expressed in terms of a natural contract [Serres 1990].

Finally, at the instrumental level, the principle of economic efficiency is a necessary one. However, it must be measured by the macro-social yardstick and no longer solely in terms of profitability at the firm level. Furthermore, two other principles may be mentioned: cultural acceptability without, for all that, obandoning the idea of change in the name of respect for tradition and territorial balance.[22]

Development is thus seen as a pluridimensional concept.[23] This fact is reflected in the abuse of the adjectives that accompany the world 'development': economic, social, political, cultural, sustainable, finally human,[24] to mention but a few. It is not too soon to spare ourselves all these attributes by concentrating on a redefinition of the content of the world development', based on the proposed hierarchical structure where the social is in control, the ecological is an accepted constraint and the economic is reduced to its instrumental role.

Beyond semantics, a far more formidable problem as regard practice is that of bringing into harmony goals which, at first sight, may appear to be contradictory and here led to painful trade-offs.

The debate on development and the environment has concentrated essentially on the characteristic situations of a zero-sum game. In the course of this debate, there has been no sufficient exploration of win-win situations which nevertheless exist and could have increased if a search had been made in this direction. The examples that could be given are those of the various cases of recycling, the so-called regenerative agriculture and especially the energy strategies that considerably reduce the consumption of fossil energy and at the same time save financial resources.[25] The same reasoning can be applied to other resources. The members of the Factor 10 Club call for a tenfold increase in the average productivity of the resources in the industrial economies, in the next half-century, as a prerequisite for sustainable development on a world-wide scale.[26]

The agenda of the Copenhagen Conference brings into play the relationship between the economic and the social while the earlier pattern tacitly assumed that the economic and the social went hand in hand. But we must now turn to the *triple-win (or win-win-win)* situations which enable progress on all three fronts together: the economic, the social and the ecological, and therefore bring about development in the full sense of the world.

We propose that the term 'development' should be reserved only for these cases by opposition to the different forms of mal-development or of lopsided development. All the relevant situations are summarised in Table 2.

To achieve triple-win solutions, we have to rethink the institutional framework in which development is conceived and achieved. Once the two extremes of the pure market economy (a liberal utopia in the etymologicalaa sense of the word) and of the centralised economy are set aside, all the real situations that exist in the world belong to the category of mixed economies, characterised by a wide variety of labour, commodity and service markets, in which there operate private profit-making firms, public undertakings and more generally States at all levels, from the central to the local, to different agents of the social economy (co-operatives, mutual benefit societies, associations and non-profit-making private organisations) and all the groups engaged partly in non-market economic activities carried out in the households.[27] For Shigeto Tsuru (1993), the mixed economy is the only mode of production that is still in the race. Jean Saint-Geours (1984) has gone a step further and refers to 'mixity' as a characteristic of our societies beyond the economic field.

Of course, the mixing of the public and private sectors can take many varied forms. Quite significantly, the search for new forms of articulation between the different social agents concerns nowadays practically every country of the globe, given the vacuum created by the collapse of real socialism, the crisis in the welfare states and the more than modest balance-sheet of development/maldevelopment in the South.

The problem is located at the level of what Paul Streeten (1989) calls the mesoeconomy, as the neo-liberal theories have overestimated, firstly, the role of macro-economic controls (of course necessary, but in no way sufficient) and, secondly, that of the microeconomic activity of the entrepreneurs. Now, in many places, even today events are all taking place according to a pattern that contradicts the one set forth by Schumpeter: the initiative and the risks are taken by the State, while privatisation at a discount subsequently benefits a class of entrepreneurs who have nothing Schumpeterian about them. The three central questions are:

- What state, for what development?
- What content should be given to democracy beyond mere compliance with the rules of the game of representative democracy?
- How to achieve new forms of partnership among the State, the civil society and the business world so as to enhance and bring out the full potential of local initiatives and citizen actions?

The questions shall be examined in turn.

What State?

For several reasons, the current debate on the state addresses the wrong questions. It starting point is the opposition between the State and the market whereas any market mustbe regulated by the State, especially if it is desired that the market economy should also fulfil a social function. The criticisms made against statism, which rightly lash out at its excesses and the weight of the bureaucracy, oversimplify the problem by calling for *less* of the state whereas the real point is that the state should be more efficient and at the same time cost less. It is fashionable to concentrate on the State failures and overlook the market failures, attimes equally numerous, as the market is incapable of grasping the long-term and the interests of society. It is legitimate to propose a reduction of the role of the entrepreneurial state, especially when the public sector consists of firms nationalised at a time when they were bankrupt and when the state, by intervening, furthered the particular interests

of some private groups serving clear aims with the establishment. However there still remain the functions of the developmental State, as in the example of Japan, South Korea and Taiwan,[28] and last but not least the functions of the regulating state. The challenge in the years to come will be to find truly democratic forms for the regulation of the mixed economies. This brings us to the second question.

Respect for political rights alone is not sufficient to define a democracy in the full sense of the world. The effective exercising of all political, civic, social, cultural and economic rights should be extended to the entire population, especially to those who are now excluded from enjoying them These include the right to individualand collective development and, of course, the right to work or to self-employment that provides a decent livelihood earned in dignity. As we have already pointed out, only integration into the productive process is capable, in the immediate future, of striking at the roots of exclusion. Assistancial policies are of course very necessary, given the predicament of the unemployed and the excluded, but they do not provide, by themselves, a lasting solution. While there is no question of abandoning income-redistribution policies, it is the income distribution which is inherent to the mode of production that should be the primary focus of our attention.

Beyond measures relating to employment, it is urgent to provide the dispossessed and marginalised populations with the means by which they can more efficiently claim their rights. To achieve this goal, it is necessary to promote education in citizenship,[29] namely to:

– raise the consciousness of all populations (children, young people and adults) and notably of groups discriminated against (women, children when applicable, cultural minorities) about their rights and duties;

– train them as regards action they can take when their rights are not respected or violated: how to get organised, where to look for effective aid, whom to call on at the practical and moral levels, how to mobilise public opinion.

At the same time, to ensure real, day-to-day participation by populations in the decision-making and management process, it is necessary to carry out an in-depth analysis of the institutional context and of the relationships among the social agents concerned, namely the organised civil society (citizens' associations and social movements), the social economy, government authorities at all levels and the world of enterprise. Special attention has to be paid to:

– institutions that play a mediatory role between the populations and the State beyond those of representative democracy alone (ombudsmen, forums and consultative councils, advocacy planning, forms of institutionalised co-operation between governmental bodies and citizens' associations);

– the practices of direct democracy (referenda, opinion polls, interactive media);

– positive discrimination policies (and their often perverse effects).

New Forms of Partnership

Participation plays a major role in the rhetoric of development. However, the reality often takes the form of strategies elaborated at the central level and imposed from above. It is necessary to rehabilitate the opposite approach favouring bottom-up initiatives, notably as regards the identification of the real needs of the population and of the hierarchy of urgent needs.[30] This means strengthening the ability of the populations to assume responsibility for a large part of the decisions that concern them, in a word, their *empowerment*. Two dangers, however, need to be avoided.

Firstly, there are knowingly manipulated ambiguities around this concept. John Friedmann (1992) has rightly made empowerment the cornerstone of the search for alternative development strategies. However, it should not be forgotten that this very same world was frequently uttered by President Reagan and, coming from him, it meant that the state was giving up certain of its responsibilities and passing them on to the local government institutions. A weak interpretation of the concept lies at the basis of the community program proposed by A Etzioni (1993). The same type of ambiguity hovers over the concept of subsidiarity cherished by the European Commission. A decision that can be taken at a lower level ought not to go up to the upper level. But then the question is who is to take a decision on this point

Furthermore, it would be vain to expect that the complexity of today's world would make it possible for us to be satisfied with a mere juxtaposition of a multitude of local strategies. The linkages among the spaces of development, from the local to the regional, national and transnational levels, constitute a major area of concern for political action. The present imbalance in favour of the central level and its incapacity to think out strategies that are finely tuned to local contexts makes it necessary to encourage initiatives from the bottom. And yet, such initiatives need to be harmonised and assisted by making available to them critically necessary resources that cannot be mobilised on the spot.

In other words, public policies and citizens' actions need to be harmonized. This major theme for the Social Summit was debated in the International Conference on Public Policies, People's Actions and Social Development organised by UNESCO in December 1994 in collaboration with the City and University of Bologna. The conference reviewed several specific examples of the linkage between citizens' movements and State policies, notably the programme of the fight against hunger and for citizenship in Brazil,[31] the solidarity programme in Mexico, the role of citizens' organisagions in the struggle against exclusion in Poland. It also discussed the prospects ahead following the end of apartheid in South Africa and European research on the reform of welfare states, with a view to establishing a "caring society"[32] through partnership among the parties concerned. The development of the social, educational and health services, as well as of the services related to making use of the time released from work provides a vast field for the setting up of new structures of partnership among users, citizens associations, local government authorities and private firms.

This area is a particularly promising one for the countries of the South and the East where the general level of wages is presently low. Indeed, since the 'productivity' of teachers, nurses of social workers is approximately the same in every country in the world, in absolute terms the cost of producing such services in these countries is low in comparison with their cost in countries where the average level of salaries is high. With a slight modification at the margin of allocation of resources to social services in the broad sense of theterm, it would therefore be possible to obtain a substantial improvement in the quality of life in the poor countries. Instead of awaiting prosperity in order to begin developing social services, it is necessary on the contrary to hasten to do so immediately.

The final Round Table in Bologne was devoted to urban experiments in Italy. It showed the wealth, variety and scale of the concrete experiments carried out at the municipal level. The cities whose almost infinite diversity has been so well brought out by Italo Calvino (1974) are indeed the crucible for the emergence and shaping of new forms of citizenship. In this field, Italy has been a stupendous laboratory for centuries. The development of urban citizenship will be necessary if we truly wish to make our cities liveable in the 21st century. This goal will not be a greater burden on our economies, especially in the industrial countries, than the cathedrals were in the middle Ages. The urban crisis needs to be treated on a priority basis. It is also in the urban framework that the question is being raised, in all its stark reality, of the inter-ethnic, inter-cultural and inter-religious relationships that are a source of numerous conflicts and endemic violence especially in situations where the mixing of different social and cultural

groups is overlaid on a context of social exclusion.[13]

S and T for Social Development

Technology is a key variable for the bringing of social, economic and environmental policies into harmony. The question is whether it is conceivable to put a brake on the present dominant trend in which technological progress means jobless growth and the role that could be played in this field by the reorientation of scientific research.

This question was put to researchers at the International Conference on Science and Technological for Social Development organized in Delhi in December 1994 by UNESCO and the National Institute for Science, Technology and Development Studies (NISTADS). They were asked in particular what was the potential contribution by science and technology to the three aspects of a potential development strategy centred on the exploration of three sources of employment which are briefly described here below:

1 The working of economies is presently characterised by the wasting, in varying degrees, of energy, water and other natural resources. Considerable progress remains to be made in the recycling of wastes and materials. Moreover, a more methodical maintenance of equipment, structures and installations that would prolong their useful life is one way of saving capital. These activities, which are major sources of job-creation, are self-financing, at least partly so, through the saving of physical resources and of capital that they bring about.

2 In rural areas, the devise battle for jobs will be fought around the future of the small farms. The small farm is destined to disappear in the long term, if we extrapolate from the presently observed dominant trends of technical progress in agriculture. However, provided that it is properly managed, the new phase of the green revolution makes it possible to envisage the modernisation of agriculture for the benefit of the small farmer. It may be added that a better use of available agricultural land is in the interest also of the industrialised countries inasmuch as they might wish to avoid being turned into urban archipelagos in a rural desert.

Furthermore, efforts should also be made to create non-agricultural rural jobs, which can be obtained in two ways:

– through the growth of biomass-transforming agro-industries and through the substitution of fossil fuel energy by bioenergy;

– through the redeployment of industries and tertiary activities, made possible by advances in telecommunications and the growing importance of flexible specialisation.

3 Finally, we must mention the classic case of public works where technical choices are not dictated by international competition. The needs in terms of infrastructure are especially urgent in countries whose systematic competitivity leaves much to be desired. So long as this competitivity has not been improved, piece-meal investment to increase productivity in firms will, to a large extent, be lost.

The discussions in Delhi concentrated above all on the first two aspects. The papers presented by the participants showed the importance attached in the world's two most populous countries (China and India) to the devising of development strategies heavily geared to the creation of rural jobs, both agricultural and industrial, and also characterised by the saving of scarce resources such as agricultural soil and water In both cases, the goal is, as far as possible, to reduce city-country migrations. Hyper-urbanisation, as in Latin America, would lead to an economic, social and ecological disaster.

A great many Indian studies, as well as field experiments undertaken by the ASTRA group of the Indian Institute of Science in Bangalore, the Swaminathan Foundation in Madras and the Development Alternatives Group in Delhi, to mention only a few of them, have shown that it is possible to use biotechnologies in very small family farms,[14] to design integrated village systems for the production of food and energy from the biomass[15] and to create industrial jobs in the countryside with exceedingly low investment and reasonable productivity. The pioneering experiments, as yet small in number, carried out by Development Alternatives have resulted in the creation of sustainable jobs in small companies, dam construction work and soil and water management requiring in certain cases, barely $ 200 to $ 300 per job created.

The Chinese programme SPARK for the spreading of modern science and technology in a rural environment has, according to the paper presented by its representative, already helped create one hundred million non-agricultural rural jobs. Ashok Jain, Director of NISTADS presented a very fine analysis of the prospects for decentralised modern industrialisation in India in the light of the experience of the *terza Italia*.[16]

The importance of the Delhi meeting lies in the fact that it has shown the existence of acurrent of thought and action that runs counter to the dominant tendency. This enables a certain degree of equanimity to be maintained when contemplating the extremely complex challenges that face the densely populated countries of the South. This message can be clearly seen in a major collective work on science, population and development organised by V Gowariker (1992), suggestively entitled The Inevitable Billion Plus.

The condition of success is that research in the countries of the south should not be made subservient to the dominant modes in the laboratories of the North and that there should be no passive waiting for the transfer of technologies developed in other latitudes and other contexts. The ambition to leapfrog the industrial countries in certain fields of research is qauite ligitimate. This is why it is the strengthening of local capacity in terms of science, technology and the training of highly qualified cadres that is the essential feature of development strategies based on the ability to think independently and carry out national projects.

The authors of the already mentioned report of the International Commission for Peace and Food, consider as viable a strategy to provide a billion new jobs in the countries of the south within barely 10 years (pp 198-99). This proposal generalises from the results of a study proposing to achieve full employment in India in one decade, thus raising the entire Indian population above the poverty threshold (op cit pp 122-24). To achieve this end, it would be necessary to create 100 million new jobs, including 45 million in agriculture, 10 million in rural agro-industries and 45 million rural and urban jobs due to the multiplier effect of increased consumption by the rural masses, agriculture being both a source of food and biomass and an outlet for industrial products and services. According to the authors of this strategy, which has been incorporated in India's VIII Plan, the country could achieve this spectacular result without resorting to external resources other than direct investment by agro-industrial firms. The condition for this however is that the country should be able to export its agricultural surpluses without any hindrance of its access to the markets of the industrial countries. The report therefore sharply criticises the agricultural protectionism of the developed countries and suggests a world strategy of development of the South through the expansion of its agricultural or forestry exports. At present, 58 per cent of the economically active population in the countries of the South, namely 1.1 billion men, women and children, work in agriculture whereas there are only 35 million working in this sector in the industrial countries. This entire reasoning is based on a controversial assessment of the potential of agriculture for the future. According to the authors of the report, the availability of soil and water for agriculture could easily be doubled at the planetary level and productivity per hectare could also be very considerably increased.

What may be retained from this surprisingly optimistic exercise is above all the idea that, contrary to a very widespread

prejudice, agriculture could be an engine of growth in development, at least in certain countries of Asia, Africa and Latin America, provided that the efforts are concentrated on labour-intensive crops and on a careful management of soil, micronutrients and water using knowledge-intensive techniques.

A complement of this strategy consists in exploring biodiversity and cultural diversity to find new resources and manage them in a socially useful and ecologically prudent way so as to increase the capacity of the ecosystems on a lasting basis. This requires making simultaneous use of knowledge accumulated by populations and of the conquests of modern science.[17]

This analysis would be incomplete without mentioning the need to rethink the working of the UN system and of the Bretton Woods[18] institutions to create an international environemnt that is more propitious to development, notably by recalling the fact that equity in international relations requires that the rules of the game should be biased in favour of the weaker partners. This principle was complied with when the UNCTAD was created. Will this be true also for the future World Trade Organisation.

What can be done to give to social movements and citizens' associations a role more active than the one that they presently have in the working of the major international organisations. In the context of the Copenhagen Conference, two aspects of this question need to be raised. Firstly, the associations could take on the responsibility of preparing citizens' reports on the world's social condition, following the example of what was done for the environment in India. Secondly, it is necessary to think about the creation of an institution enjoying unquestionable moral authority, to which citizens' organisations could appeal, alerting in this way public opinion about violations of politicla, civic, social, cultural and economic rights and thus influencing the functioning of governmental and intergovernmental institutions.

By Way of a Conclusion

By its vocation, its past and its potential, UNESCO is destined to play a major role in the co-ordination of research and in the implementation of new paradigms and policies of development. One step that could contribute to this goal has been the creation of the MOST programme within the Organisation in 1994.

Among the subjects that we have mentioned, there are some on which work is already going full steam ahead, notably as regards education and culture where two international commissions have been created by UNESCO.[19] Others need to be taken up in collaboration with other international organisations, governmental institutions and communities of researchers. The most immediate task will be to establish a detailed follow-up of the implementation of the recommendations of the Social Summit in permanent interaction with citizens' organisations and to prepare a programme of activities corresponding to the priorities that will be set in Copenhagen.

Notes

1 The main dates to be noted are 1947: Indian independence, 1949: the victory of the Chinese Revolution, 1955: the Conference of Solidarity of Asian and African countries in Bandung, 1960: African decolonisation.

2 The almost exclusive attention paid to advances in the audio-visual sector has diverted attention from the second Gutenberg revolution which is taking place under our very eyes and is opening up extraordinary possibilities for the production of school books and textbooks. We refer to the very substantial drop in the cost of production of books printed on a large scale. Italian editions of 100 page books selling for 1,000 lire have been followed by English and then French editions of major classics of several hundreds of pages, selling for £ 1 and 10 francs.

3 According to Naisbitt (1995, pp 132-33) tourism and travel provide employment to 204 million people throughout the world and correspond to 10.2 per cent of the world's GNP. Nearly 11 per cent of expenditure by consumers is allocated to tourism and travel. Naisbitt very optimistically puts the number of new jobs that will be created in these sectors up to the year 2005 at 144 million. Nearly half of these jobs correspond to the Asia-Pacific region.

4 See also, by the same author Le destin technologique (1992) and the essay by Giorgio Ruffolo (1988).

5 This is what has been denounced by Rajni Kothari (1993). For his part, Jacques Delors has said: "We are already living, alas, in a society that gets upset about injustice and from time to time takes part in televised charity shows, gives money and then for the rest of the time is complacent. This is ghastly but it is what we are increasingly threatened with". Interview with *Le Monde*, Novem-ber 15, 1994. See also Marshall Wolfe (1994, p 1) for whom the word "exclusion" indicates the superfluity of the excluded as opposed to their incorporation into the economy under conditions of exploitation and of the absence of all power. In a very recent and seminal work on the disintegration of the wage-earning society and to the metamorphoses of the social question, Robert Castel (1995, p 22) prefers the term social disablement.

6 On this subject, see the report by the UN Secretary General, 'Development and International Economic Co-operation – An Agenda for Development', document A/48/935 dated May 6, 1994 as well as the Position Paper by the Director-General of UNESCO: Towards the Preparation of the World Summit for Social Development, UNESCO, July 29, 1994.

7 In its analysis of the global economy published in its edition dated October 1, 1994, *The Economist* lumped together the economies of the Third World, the Eastern European countries and the former Soviet Union under the term "developing countries" as opposed to the "rich industrial countries".

8 Cf Laura Balbo (1994), 'From Welfare State to Caring Society', contribution prepared for the International Conference on Public Policies, Peoples' Actions and Social Development organised by UNESCO, the University and City of Bologna, Bologna, December 2-3, 1994.

9 Enforced idleness is quite the opposite of the revolution of liberated time released through advances in productivity inasmuch as this revolution implies a reduction in the heteronomous working time of people who have already been socialised by work. Ivan Illich (1977) and Andre Gorz (1988) have very well shown how this released time could be used for autonomous economic and non-economic activities and thus contribute to cultural enrichment and the fullness of life. However, the deliberately provocative title of Illich's book, *Creative Unemployment*, lends itself to confusion. For a discussion of the revolution of liberated time, see also Echanges and Projets (1980), Sachs (1984) and Aznar (1993).

10 Nor are there any grounds for expecting a major creation of jobs through the replacement of wage-earning work by forms of workers' participation in profits (the notion of the sharing economy) as postulated by J Meade (1986) or M L Weitzmann (1985). In this respect, see R Brunetta (1994).

11 As Anizur Rahman Khan has prudently stated (1993, p 67): it is very difficult to offer convincing proof that the programmes of adjustment have succeeded in protecting the interest of the poor.

12 For more details, see I Sachs (1994).

13 See also Ricardo Petrella (1994). Contrary to R Reich (1992), Paul Krugmann (1994) is, among American economists, the one who has most clearly seen the danger of giving excessive importance to competition for external markets to the detriment of the fundamental question of the development of the domestic market.

14 Dollfus has written: "A new form of exclusion arises with the world economy and market: the exclusion of the "useless", of those who cannot or do not wish to sell their abilities and their labour force, who, because of their poverty, do not have purchasing power that is sufficiently worthwhile for the market. "Useless" individuals are localised in entire regions of the world as well as right within societies that are considered to be prosperous" (p 9).

15 For an analysis of the most striking characteristics of policies based on the principles of the Washington consensus in the Indian context, see: Deepak Nayyar (1993) and Lance Taylor (1994). See also Christian

Comeliau (1994).

16 These typologies should serve as a referential system for an examination of concrete historical cases and must not be taken as a set of boxes in which different countries may be separately classified.

17 The historian and the developer have much in common, except that the historian interprets the past which has already taken place while the developer seeks to influence the course of the future. The interdisciplinarity and comparative approaches of the kind practised by historians contain precious lessons for the developers

18 "Resourcefulness" is a key concept in eco-development

19 The Polish economist J Hausner (1995) speaks of the "negotiated strategy" among the social agents. The experience of French planning has the same thrust.

20 Here is a truly Gandhian question that applies, nevertheless, primarily to the industrial societies and is found also in a somewhat different form among certain Catholic thinkers; see in particular the Encyclicals of John-Paul II (1994) This question has raised a sharp debate in Sweden (see *What Now*? 1975).

21 For a selection of his writings, see *Economie and Humanisme* (1986).

22 For more details see I Sachs (1993).

23 Henri Bartoli's work (1991) on the multidimensional economy starts with a reference to Blaise Pascal's view that not only it is impossible to know the parts without knowing the whole, but also to know the whole without knowing specifically the parts.

24 It is unfortunate that the UNDP has chosen the word 'human' rather than 'humane'

25 In this respect, see notably the pioneering book of Goldemberg et al (1988) and the work of Benjamin Dessus (1995).

26 For more details and notably for recommendations on policies to be followed, see the Camoules Declaration reproduced in *Development Alternatives Newsletter*, Vol 4, No 12, December 1994 (New Delhi).

27 The extra-market economy should not be mistaken for the "informal economy" which is a part of the market economy.

28 In this respect, see the books by Chalmer Johnson (1982), Christian Sautter (1987) and Robert Wade (1990), the already cited articles by Deepak Nayyar and Lance Taylor and the presentation by Robert Delorme (1955) of the approach put forward by the so-called evolutionary economics school.

29 The search for new forms of education in citizenship and of the learning of social roles from the primary school stage are additions to the many, so-to-speak classical functions of education and training in development strategies See the already mentioned document by the Director-General of UNESCO prepared for the Copenhagen Summit (cf Note 6).

30 This brings us back to the debate on "basic needs", their weak version prepared by the authorities and their strong version when it is the concerned parties that establish the hierarchy of these needs. In this respect see B Wisner (1988) and the fundamental contribution by A K Sen (1986) to the theory of the satisfaction of needs showing the multiplicity of forms that could come into play (entitlements).

31 One of the first measures taken by Brazil's new President, Fernando Henrique Cardoso, was to set up an ambitious programme called "Solidarity Community" based on the principle of partnership between the state and citizens' movements

32 In this respect see the study by Laura Balbo presented at Bologna (see Note 8), the recent work by Pierre Rosanvallon (1995), and for the antecedents of these debates, the study prepared by the Secretariat of Future Studies in Sweden (M Lagergren, et al, 1984). The growth of the third sector in the world has been the subject of a set of reports organised by Civicus, World Alliance for the Participation of Citizens (see for Latin America, Rubem Cesar Fernandes, 1994 and for Eastern Europe, E, Les, 1994).

33 The UNESCO programme on the 'Management Of Social Transformations' (MOST) concentrates its activities of research and of proposing new policies specifically on these questions.

34 On the prospects and dangers of the growth of biotechnologies for the countries of the South, see notably, *Biotechnology Revolution in the Third World* (1988), Ahmed (1992) and Sasson (1993).

35 On this subject see Moulik (1988) and Sachs and Silk (1990).

36 For an analysis of the determinants of the success of the Italian experience in decentralised modern industrialisation, which has brought wealth in North-East Italy, see notably Bagnasco (1988), Pyke, Beccatini, Sengenberger (1990) and Pyke, Sengenberger (1992) Trigilia (1992) examines the reasons for the failure of the mimetic transposition of this model to Southern Italy.

37 This goal is being pursued by the UNESCO South-South co-operation programme for environmentally sound socio-economic development in the humid tropics. See *Perspectives Sud-Sud*, No 1, October 1994, information letter by UNESCO.

38 On this subject see notably Holland (1994).

39 The International Commission on Education for the 21st century, presided over by Jacques Delors and the World Commission on Culture and Development set up under the chairmanship of Javier Perez de Cuellar.

BANK OF BAHRAIN AND KUWAIT B.S.C.

(Incorporated in Bahrain with Limited Liability)

INDIAN BRANCHES

Notes forming part of the accounts for the year ended 31st March 1995

Principal Accounting Policies

1 General

The financial statements have been prepared on the historical cost basis

2 Foreign Currencies

(i) Assets and Liabilities in foreign currencies are translated at the rates prevailing at the end of the year

(ii) Outstanding forward exchange contracts are revalued at the rates prevailing at the end of the year and the resultant gains or losses are accounted for However the contingent liability in respect of outstanding foreign exchange contracts is included at the contracted rates

3 Investments

In accordance with the Accounting Standards for Investments laid down by the Reserve Bank of India investment portfolio is classified into 'Permanent' and 'Current' categories

Permanent investments are stated at cost adjusted for any premium or discount amortised from the date of purchase to the date of maturity on a straight-line basis

Current investments are stated at lower of cost or market value

Treasury Bills and Commercial Papers are stated at carrying cost

4 Advances

Provisions for bad and doubtful advances have been made to the satisfaction of the Auditors

(i) In respect of identified advances, on the basis of norms laid down by the Reserve Bank of India for identification of and provisioning for non performing assets

(ii) In respect of other advances, as a percentage of the total pre tax profit for the year, after taking into account general factors that relate to latent doubtful debts which are not separately identified Loans and advances are stated net of provision made under (i) above

5 Revenue Recognition

(a) Interest income on all advances other than non performing assets is recognised on accrual basis

(b) Income from investments is accounted on accrual basis, except for dividend income from units of UTI

(c) Commission exchange and brokerage are accounted on accrual basis, except for commission on underwriting and Letters of Credit

6 Depreciation

Depreciation is provided for on fixed assets on the written down value basis at the following rates which are equal to/higher than those prescribed under Schedule XIV of the Companies Act, 1956

Office Equipment	25%
Office Furniture	18.10%
Computers	40%
Vehicles	25.89%

Depreciation on additions is calculated for the full year irrespective of the date of addition, and no depreciation is provided in respect of assets sold during the year

7 Gratuity

The liability for gratuity is accounted for on the basis of actuarial valuation

8 Net Profit

The net profit disclosed in the profit and loss account is after

(i) Provisions for taxes on income in accordance with statutory requirements

(ii) Provisions for doubtful advances

(iii) Transfers to contingency funds

(iv) Other usual or necessary provisions

The difference as at 31st March 1995 between the book value and the market value of permanent investments has not been provided for, since these investments are intended to be held upto maturity and, in the opinion of the management, the fall in the market value does not affect their realisable value at maturity

III Previous year's figures have been regrouped wherever necessary to make them comparable with the current year.

INDIAN BRANCHES

Report of the Auditors

We have audited the attached Balance Sheet of the Indian Branches of Bank of Bahrain and Kuwait B S C as at 31st March 1995 signed by us under reference to this report and the relative Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with provisions of Sub-section (1), (2) and (5) of Section 211 and Sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and drawn up in accordance with Schedule VI to the Companies Act, 1956 The Accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949

We report that subject to and read with the foregoing remark

a) We have obtained all the information and explanations which to the best of our ledge and belief were necessary for the purpose of our audit and have found them to be satisfactory,

b) The transactions of the Branches which have come to our notice have been in our opinion, within the power of the said Branches of the Bank,

c) In our opinion, proper books of account, as required by law have been kept by the Branches so far as appears from our examination of those books,

d) The Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account,

e) In our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31st March 1995 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches for the year ended on that date

Cost Recovery in Diagnostic Facilities

Brijesh C Purohit
Tasleem A Siddiqui

Until 1982 public teaching hospitals in Rajasthan provided diagnostic facilities such as X rays, free of cost of patients. Budget constraints have compelled the institutions to introduce an auto financing scheme (AFS) aimed at recovering variable costs of the tests. The experience of the AFS scheme provides useful pointers about user-charge mechanisms.

UNTIL 1982 in teaching public hospitals of Rajasthan X rays were provided free of cost to poor patients, state government servants and certain other categories of indoor and outdoor patients. However due to budget constraints the availability of X-ray films fell short of requirements. As a result a large number of indoor and outdoor patients had to go to private clinics. To rectify this situation it was proposed to start a cost to cost basis scheme for X rays the auto financing scheme (AFS). After lengthy discussions the scheme was approved by the state government on January 9 1982 and actual implementation took place with effect from October 8 the same year.

Initially the scheme covered only X rays. Its scope was extended in January 1983 and again in June 1983 to cover new and special investigations. Over the years, it has grown to cover more departments. At present in any teaching hospital in Jaipur, it encompasses seven departments: radiology, cardiology, nephrology, nuclear medicine, pathology, bio chemistry and microbiology. The total number of tests under all these departments covered by AFS is 73. The AFS aims at recovering the variable costs of tests. Initially the rates were fixed to recover cost of materials, chemicals and consumables required to carry out a particular diagnostic test. Subsequent revision of rates were not based on economic criteria.

In a developing economy like India any scheme that aims at cost recovery through user charges mechanism has significant implications for financial self sufficiency and availability of hospital services. The experiences emerging from micro level studies of such a scheme (like AFS) could have useful implication in planning and implementing hospital facilities in future [Vogel 1991, Griffin 1987]. With this in view, the present study aims at evaluating the AFS in the light of established economic criteria and in exploring the usefulness of feasible alternative rate structures in enhancing the hospital's ability to undertake additional patient care. The data used for this study covered 19 diagnostic tests across four departments namely, radiology, cardiology, nephrology and nuclear medicine between 1985-90.

Cost Elements and Cost Computations

The cost elements contributing to the various diagnostic tests have been broadly categorised into fixed and variable costs. Fixed costs include staff salaries, maintenance of buildings and depreciation of machinery and equipment. The variable costs include medicines, materials, chemicals and power consumption for the major machines, equipment and the supporting plants like air conditioning. In order to compute these various costs, information was collected from the different departments, the concerned clinicians and technicians.

For variable costs, information pertaining to consumption of materials, medicines and chemicals emerged from the technical details of test procedures obtained through combining information from on the spot observation of the test procedure, discussions with the technician and perusal of records.[1] The consumption figures were multiplied by the respective prices to obtain the relevant costs. Variations in cost across years were incorporated by using the price indices related to medicines, materials and chemicals.[2] The power consumed by each of the machines and equipment (including air conditioning) used in the test were used to calculate the per test power consumption.

In case of fixed costs, *pro rata* allocation method was employed. For staff salaries, the total staff were categorised into teaching and non teaching. In the former, the time

Note a Since the rates in radiology department were revised in June 1991, the rates presented in these years represent an average of two rates (in the same year), which prevailed for six months duration each.
Source Hospital Records.

spent in patient care was separated from the time spent in teaching.[1] Of the time spent for patient care, a further classification was attempted in terms of in-patient and out-patient care. The time spent on out-patient care was allocated to the appropriate category of test. Where the same teaching staff was involved in a number of test categories conducted within a department, a priori *pro rata* distribution of OPD care time was made to each category of test. The time allocation of teaching staff arrived at in this manner was multiplied by the respective salary cost of the concerned teaching staff based on the existing pay scales and other allowances.

In case of non teaching staff, their entire working hours were distributed according to the number of tests carried out in a particular department and multiplied by the hourly salary cost computed as above.

Maintenance costs were estimated using the figures collected from local public works department (PWD), the agency responsible for the maintenance of the hospital. The average maintenance cost per square foot of the building structure was computed and was multiplied by the floor area of the department/unit relevant for a particular diagnostic test. This was then allocated *pro rata* according to the number of tests conducted in the department/unit during the year. The depreciation for instruments, equipment and machines was imputed using purchase cost of machinery and applying straight-line method. This was then allocated *pro rata* according to the number of tests done on that instrument/equipment/machine.

Notes The available figures for ECG test for the year 1991 only relating to difference in revenues based on VC and Rate and TC and Rate are as Rs 355191·30 and Rs 187719·46 respectively. Inclusion of ECG with one year figures leads to net loss/surplus in VC and Rate and TC and Rate respectively as Rs 1398776·90 and (-) Rs 1970114·50.

(a) The figures in radiology department cover the period up to November 1991.

1. VC = Variable Cost 2. TC = Total Cost 3. TMT = Treid Mill Test

4. CTMT = Computerised TMT

Source Hospital Records.

EXISTING RATE STRUCTURE

The existing rates for the AFS applicable tests covered by the study are presented in Table 1 along with the corresponding variable costs (VC), fixed costs (FC) and total costs (TC). Several characteristics of the existing rate structure emerge. Firstly, the existing rates, most of which have been prevailing since the inception of the AFS, often do not cover even the variable costs fully in a number of diagnostic tests. These include the larger X-rays (14" x 17", 14" x 14", 12" x 15") dental X-rays, heamodialysis, TSH test, HGH test and LH test. Total cost recovery does occur in the smaller X-rays (10" x 12", 10" x 8", 6·5" x 8·5"), 2D Echo, T3 and T4.

Secondly, the adherence to the AFS criteria (recovering variable costs) varies even within each department resulting in cross-subsidisation across tests in the department (Table 2). Consequently department-level performance on the AFS

LH	0·57	01	18	273	0·36	0·35

Source Estimated

criteria differs considerably In radiology, for instance, one finds that going by variable costs, the three smaller X rays help cover 11 per cent of the loss incurred by the other four, bringing down the cumulative loss during 1987 91 to Rs 64 39 849 The scenario using total costs is much worse a net cumulative loss of Rs 83 29 958 with only one X ray (6 5 x 8 5) subsidising 1 62 per cent of the loss from the other six

The nuclear medicine department on the other hand is a surplus generating department on both variable and total costs with the surplus from 13 and 14 easily compensating for the loss from the TSH HGH and I H tests In the cardiology and nephrology departments all the AFS tests recover their variable costs but none recovers the total costs

It will be recalled that the AFS was conceived in response to budgetary constraints causing shortage in X ray availability Our analysis thus far has shown that currently adherence to AFS criteria varies across tests, consequently departmental performance varies The AFS tests in radiology department still have a net loss in variable cost terms those in nephrology and cardiology recover only variable costs and those in nuclear medicine recover the total cost Moreover the number of tests being done has been rising annually (charts 1 to 4) In the radiology department most of the tests have grown at the compounded annual growth rate of 39 per cent In other departments the rate has ranged from 23 to 68 per cent per annum (Table 3)

At the same time there has been no attempt to revise rates in tune with changing costs This has been due to the long procedures requiring sanction for revised rates from upper levels of bureaucracies in the health directorate Moreover upward rate revision would attract public criticism and is therefore avoided The effect of continuing this policy as shown in Table 4, highlights that given the rise in price index of chemicals and consumables presently being used in the various tests it will not be possible for the hospital to recover fully variable costs even in 1995 Only exceptions in this regard are TMT Echo doppler 13 and 14 tests As a consequence self financing status of the scheme is ruled out in the near future If one considers the fact that revenue surplus generated forms the basis of providing certain free tests to the poor and needy patients this possibility may not exist at all (Table 4 column 8 9)

Alternative Rate Structures

That the hospital is facing, and will continue to face budgetary constraints is

Table 4 Number of Free Tests Permissible with Existing Rates in Currently Surplus Generating Units 1995 and 2001 AD

an undeniable fact. Some degree of self-financing is, therefore, essential and it is clearly evident that the present policy cannot be continued for long However, it is also important to realise that public hospitals are set up to ensure that the poorest strata of society have necessary access to the facilities Justifying a rate revision then becomes a difficult issue The debate tends to revolve round concerns of equity and need, and acquires emotional as well as political overtones

At the same time, it is also widely accepted that public hospitals, especially the large teaching hospitals like the one studied, do in fact, cater to a wide cross-section of the society There is, therefore, a practice in many public hospitals in India to charge higher rates from the better-off patients while simultaneously ensuring that the poorer patients pay affordable rates, either by implementing a differential pricing policy or by a system of writing off the bills of deserving patients or both [4]

In this scenario, the decision maker would be better able to press for a rate revision if he or she could use cost as the basic rationale for setting rates show that a wide cross section of society are using the facilities demonstrate that the revised rates are in fact very reasonable and reassure the stake holders that the revision would in fact benefit the poor who come to the hospital This section demonstrates calculations that the decision maker could use to buttress the choice of rate structure It assumes that the money freed by "tightening" the AFS scheme would be available for the hospital to use as it pleases

Using costs as a rationale for setting rates would mean basing calculations on one of the following economic criteria [5] average variable cost (AVC) average total cost as well as a part of fixed cost (ATC), incremental variable cost (IVC) and incremental total cost (ITC) Of these, analysis showed that charges based on incremental variable or total costs (IVC and ITC) were unsuitable because they were sometimes quite high and also fluctuated widely across tests We will, therefore use only the AVC and ATC based rate structures in the analysis

Notes AVC = Average variable cost ATC = Average total cost
Source Estimated

In order to demonstrate that the rates are, in fact very reasonable we have compared the minimum market rates at nearby private diagnostic facilities with the rates as per the two different criteria (Table 5). Our recommendations are such that a considerable gap remains between the private and the public hospital rates. The private rate reflect the paying capacity of the relatively better off strata in society consequently the difference between the hospital and private clinic rates can be interpreted as the extent of consumer surplus available with them.

To reassure the stakeholders that the revision would in fact benefit the poorer strata we also simultaneously computed that the number of free tests the number of free OP patients and the number of free IP patients' would have been possible without additional burden to the hospital if the suggested rates had been implemented over the last few years.

In the loss making tests in radiology (14 x 17, 14 x 14, 12 x 15 and dental X rays) the difference between AVC and ATC is small. ATC rates could therefore be charged and even then the rates would still be 69, 60, 56 and 82 per cent of the lowest market rates respectively. The additional resources from charging ATC for the loss making tests would have been equal to 26.3 per cent of the total hospital budget. 14 766 out-patients or 1 387 in patients could have been treated fully free with these resources or 67 740 free X rays could have been done (Table 5a).

In the nuclear medicine department however the difference between ATC and AVC from the loss making tests are considerable. The AVC rate would therefore be preferable and would result in the charges being 33, 31 and 39 per cent of the private rate for the TSH, HGH and LH respectively. 53 out patients or 5 in patients could have been treated free of charges or 14 more tests done.

In the tests which are recovering at least average variable costs it can be seen that the existing hospital rates are generally around one third of the prevailing lowest market rate. Here the decision maker could either keep the status quo or recommend an increase in the permissible number of free tests (Table 6).

Implementing Suggested Rates

The implementation of rate structures as suggested in the preceding sections is likely to have significant impact upon utilisation decisions of patients and future expansion plans of the hospital. On the one hand the self sufficiency emerging from rate revision will enable the hospital to serve more patients in these diagnostic facilities. On the other hand the existing provision of free tests to the poorer and needy patients could be continued without extra financial burden to the hospital in the near future as well. Nonetheless an upward revision in the existing rates as suggested by us may discourage some of the poorer patients from utilising these facilities. Similar experiences in some other developing countries following such type of rate revisions (or imposition of new user charges) were noted as having discouraged frivolous use of diagnostic facilities [Widdington and Inyimavew I and II 1989]. It is also likely that some of the patients taking into account the non clinical components of the diagnostic facilities namely staff behaviour waiting

CENTRE FOR SOCIAL STUDIES
SURAT

Training Course on Computer Applications in Social Sciences

The **Centre for Social Studies Surat** is organising an **ICSSR** sponsored course on ***Computer Applications in Social Sciences*** from **September 11 to September 20, 1995**. The Course is meant for social science researchers who are engaged in survey research and need to deal with analysis and data processing. Knowledge of basic statistical method is essential. This course is designed to orient the participants to *fundamentals of computer, computer processing, foundation of data processing, quantification methods, statistical techniques and use of SPSS*.

Travel (to and fro second class), lodging and boarding will be provided free to the selected participants. Those selected will have to deposit Rs. 250/- as earnest money which is refundable only after full attendance in the course.

Individuals should apply by furnishing the following information:

1. Name, 2. Address for communication, 3. Age, 4. Language (speak, read, write), 5. Affiliation to Institution/University, 6. Present position/designation, 7. Qualifications, 8. Discipline in which holding an M.Phil/Ph.D. degree with topic, 9. Survey research capability in terms of whether you have studied i) Survey research methods, ii) Statistics, iii) Data processing techniques, iv) Computer packages/programmes (specify), 10. Computer language known (specify), 11. Accessibility to computer facility, 12. List of your current research projects, 13. Whether travel expenses can be borne by your institute, 14. Have you applied to such courses conducted by us earlier?/ when?, and 15. Recommendation of the supervisor or department head.

Completed applications to the **Course Director, Centre for Social Studies, University Campus, Udhna-Magdalla Road, SURAT – 395 007**, latest by **7th August (Monday), 1995**. *Our Fax No. (0261) 667173*

arrangements, and observation room facilities (like privacy, etc), may consider the public hospital's facilities as of lower quality relative to the private clinics. Such perceptions, the experiences elsewhere suggest, may also lead to decline in number of patients utilising the public hospital's facilities [McPake 1993]. These apparent demerits of the rate revision however should induce rethinking in the hospital administration towards improving the public image of quality of these diagnostic facilities through better upkeep.

However, as pointed out earlier, the growth so far in the number of these tests has been appreciable (Table 3). Our projections based on these growth rates also suggest that rate revision would provide potential resources for maintaining the existing level of utilisation of facilities as well as future feasibility in providing free tests to poor patients. With the existing level of growth in demand for these facilities, the hospital through rate revision could have better scope in radiology department and benefit itself and the poor patients more (Table 6a). In fact, the additional generation of revenue based on our suggested AVC criteria comes out to be 86.04 per cent and around four months equivalent of hospital's incremental budget respectively in the years 1995 and 2001 AD (Table 7). Unlike this in nuclear medicine department the adoption of our suggested AVC criteria would correspondingly bring about only 0.82 per cent and 7.73 per cent of the incremental hospital budget.

Further from the point of view of diagnostic tests currently generating revenue surpluses, the review of existing rates would be necessary in future to maintain the number of free tests which are presently being permitted. This would be essential in view of rise in the average variable cost and average total costs of these tests. However, with the existing surplus position, the rate revision may not be suggested until 1995 for four of the tests including TMT, 2D Echo, T3 and T4.

Conclusions

The experience of the AFS scheme and the analyses we have presented have several lessons regarding user charge mechanisms for cost recovery in public services in general and public hospitals in particular. While the pressure on such services is increasing both in terms of increasing usage and decreasing finance, the management support that they have is poor and usually limited to clerical functions. Regular rate revisions, which are essential if partial self-financing is to be maintained, are difficult to implement because of stakeholder pressures. Typically, they tend to be postponed until they become inevitable and are then done arbitrarily.

The absence of management techniques like the economic criteria used in this study results in hidden and ill understood cross subsidies. In contrast, use of the economic criteria pinpoints weaknesses in the system and helps estimate the effect of rate rationalisations on the financial status. However, it is not enough that the management techniques used are theoretically sound. There is a need to take careful note of the context in which the decision maker works and then use the techniques such that they help the decision maker to not only fulfil the organisation's objectives but also to present his/her case in a manner which facilitates success.

Notes

[The authors wish to thank various officials at the study hospital for their co-operation. Thanks are due to Ford Foundation for sponsoring this study at IIHMR, Jaipur.]

1. For a detailed discussion of the technical procedures involved in each of the tests as well as the computations pertaining to individual cost elements in these tests, see for instance, Purohit and Siddiqui (1992).
2. For this purpose, we have utilised the price indices available from *IFS* (1991) and CMIE (1985-91).
3. The time devoted in the administration of a department dealing with the diagnostic tests is also included in the patient care component as far as the time allocation for a particular test is concerned.
4. Sometimes a differential pricing system based on the ability to pay principle has been advocated. However, in practice it does not work appropriately. For a discussion in this regard pertaining to two of the Indian states, namely, Maharashtra and West Bengal, see Giridhar et al (1987).
5. For fixing rate structure pertaining to health facilities in public sector hospitals, see for instance, Vogel (1991, 1988), Griffin (1987), Ellis (1987) and Lucy (1988).
6. These are based on budgetary figures and statistics relating to in-patient and OPD for the study hospital. In this context, see for instance, Purohit and Rai (1992a and b).

DISCUSSION

Selective Readings of Feminist Scholarship

Anand Chakravarti

'FEMINIFICATION of Theory (March 25) by Dipankar Gupta (DG) suffers from two major limitations first it draws entirely from a restricted aspect of western experience, and that too in a highly tendentious manner, and second fundamentally, it is based on a one sided understanding of feminist scholarship that which revolves round the symbolic representation of the female body and associated bodily processes

The connection between western feminism and male bashing bra burning nude marches and the unabashed use of obscene language is not merely doubtful but possibly a major falsification a product of the media which has indulged in sustained feminist bashing, particularly in the west However what is most unfortunate is that such a purported link-up, which only serves to trivialise the women s movement is being made not by the media but by someone who would wish to be regarded as a serious social scientist

The most regrettable dimension of DG s essay is that it conveys a false and distorted picture of contemporary feminist scholarship, even in the western context, because it is premised on certain writings conforming to the post modernist genre It gives the impression that the principal concerns of feminist writings are with the female body and the poeticisation of various female biological processes DG thus yokes post modernism and feminism together as if they have no existence independent of each other This is a seriously flawed understanding of feminist scholarship because it ignores a whole range of writings that are certainly not confined to issues around the female body, and examine patterns of institutionalised male dominance (henceforth referred to as patriarchy) as a reflection of unequal power relations in various spheres of social life These writings which most unbiased scholars would recognise as having added substantially to the understanding of power, address gender issues from a broadly political economy perspective They include works that examine the historical roots of patriarchy (for instance Gerda Lerner, *The Creation of Patriarchy*, Oxford University Press, 1986), and the operation of this institution in spheres such as the family and the economy (for instance Christine Delphy, *Close to Home*, University of Massachusetts Press, 1984), legal institutions the state, and social policy (for instance, Linda Gordon (ed), *Women, the State and Welfare*, University of Wisconsin Press, 1990) Such studies underscore the concerns of the authors to tangible, real life problems of gendered subordination, including exploitation and discrimination which is in stark contrast to the concerns of those authors of the post-modernist persuasion whom DG cites liberally as valorising the symbolism of female bodily processes It is the former perspective that has made possible in recent times the meaningful incorporation of gender in the sociology of stratification

It should also be pointed out that DG has conflated the whole of feminist studies in the west with just one brand of post modernism He has thus ignored the writings of many feminist scholars who while writing within the post modernist framework analyse power and not bodily processes (for instance Joan Wallach Scott *Gender and the Politics of History* Columbia University Press 1988)

In the light of such studies among numerous others that centrally address the *unequal* interface between men and women I strongly disagree with DG s assertion that 'feminist scholarship will typically ignore those areas where women interface with men (p 620)

Two general observations are in order as a conclusion First I wonder why DG has totally bypassed feminist scholarship that has addressed issues rooted in the country to which he belongs A number of sensitive scholars both Indian and foreign have highlighted gender-based inequalities in various institutional spheres that are heavily charged with patriarchal norms, such as caste (Prem Chowdhry, *The Veiled Women*, Oxford University Press 1994), the economy (Maria Mies, *The Lacemakers of Narsapur*, Zed Press 1982), and legal institutions and the state (Bina Agarwal, *A Field of One s Own* Cambridge University Press, 1994) Second, DG s statement that "male partisanship with feminist studies actually stems from their post-modern inclinations" (p 620) is nothing short of incredible One outstanding scholar who is far from being a post modernist, but has nevertheless seriously incorporated the gender perspective in his recent work is Amartya Sen What DG needs to recognise is that a genuine student of social inequality will not hesitate to explore the full range of unequal power relations in society, *including those that are gendered* and this has absolutely nothing to do with being a man or a woman If male scholars have excluded themselves from the study of women s subordination in all its manifestations both historically and in contemporary society the fault lies in the one sidedness of their scholarship

It is indeed a pity that instead of addressing the serious issues generated by feminist scholars focusing on gender as a crucial component of stratification and pointing to the lacunae in theorising patriarchy, which would have creatively furthered the relevant debates DG has joined the ranks of those who have chosen to attack anything that disturbs the even tenor of so called mainstream academic writing

Undoing of Green Revolution

Priyatosh Maitra

I WOULD like to add two missing points to Meera Nanda s otherwise most illuminating paper Transnationalisation of Third World State and Undoing of Green Revolution (*EPW* January 1995 pp PE 20 30) The two missing points are (1) the aspects of transition from the green revolution (GR) to agro-business should have been looked at as an indispensable part of the globalisation process of capitalist production in its last two phases, i e the globalisation of investment via credit finance, aid and investment (1950s to 1970s) followed by the current process of globalisation of production (We all know of the first phase of the globalisation in terms of trade in goods and commodity capital (late 19th century to 1950s)) Nanda has rightly defined the GR belonging to an era of economic nationalism which characterises the second phase of globalisation as mentioned earlier This period helped the growth of capitalist sector in agriculture and industry [Maitra 1994 and 1995] which was required by world capitalism as a condition for its transition to the third or the last phase of globalisation of production which has begun since mid 1970s State intervention and economic planning characterised the economic policies and institutions to facilitate investment of the huge accumulated capital and technology of the western world and thereby stimulate capitalist productive forces It has benefited the developed capitalist world most by enabling it to achieve full employment which helped development of fuller potential of technological change, fuller development of productive forces, mass affluence, etc The growth and strengthening of capitalist sectors in the third world has been achieved

in this way but unfortunately, and as expected, without capitalist transformation of these economies Capitalism does not need it today, rather it deliberately plans it this way so that social consciousness of these people remain pre-industrial and communalism infested (India is a bright example of this success of capitalism)

(2) After two decades' state supported planned growth efforts, the capitalist sector in India became stronger, better organised and dependable for direct foreign investment, i e, for inclusion in the programme for the globalisation of production of western capitalism which needs today the dismantling of state intervention, privatisation and unrestricted markets (product, money and labour) National markets do not mean much when you have the world market as the target

The import substitution policy for domestic markets in all sectors (in agriculture, the GR) marked the second phase of internationalisation of capitalism, while export substitution, the current or the third stage Thus the rise and fall of GR followed by the transplantation of agro-business approaches in agriculture is an historical product of the process of the globalisation of capitalism that has been evolving since the late 19th century [Maitra 1993]

There is no doubt that these changes would create enormous opportunities for abysmally low income, self employment and family labour run low wage activities in redistributive sectors which mushroom in this atmosphere Therefore we will have to put up with so called full employment (2 per cent unemployment) with over 40 per cent of the population living under poverty line (see *EPW* 'Removal by Definition , January 28 1995 p 189) There is no economic reason why this proportion will not go on rising unabated in future under the present policy This is happening in the developed capitalist countries, too, although their unemployment problem is basically different from the one we are facing in India and other third world countries today But that is another story

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints

362 pages Rs 275

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it

SCHEDULE 17: NOTES ON ACCOUNTS

I ACCOUNTING POLICIES

(a) General

The accompanying financial statements have been prepared on the historical cost basis and unless otherwise stated conform to the statutory provisions, Reserve Bank of India s (RBI) guidelines and practices prevailing within the banking industry in the country.

(b) Foreign Currency Translation

Monetary assets and liabilities in foreign currencies are translated at the exchange rates specified by the Foreign Exchange Dealers' Association of India (FEDAI) at the balance sheet date, except for Foreign Currency Non Resident (FCNR) Account balances under the RBI scheme which are translated at the rates specified by the RBI Resultant gains or losses arising out of such transactions are recognised in the Profit and Loss Account

Income and Expenditure items during the year are translated into Indian Rupees at the rate current at the date of transactions

Contingent liabilities at the end of the year are stated at the exchange rates notified by FEDAI

Gain/Loss on forward contracts is accounted for in the Profit and Loss Account on the date of settlement

(c) Investments

Investments in approved Government Securities have been classified/reclassified under 'permanent' and 'current' categories as per the RBI directives and have been valued as under

The current investments are valued at the lower of cost and market rate

During the year current investments amounting to Rs 100,000 were reclassified as permanent investments

Permanent investments are valued at cost in terms of letter from the RBI, DBOD No BP BC 44/21 04 048/95 dated April 15, 1995

(d) Advances

Provision for doubtful advances are made on the basis of periodic appraisals by the management during the year Following such review no provision has been made in the accounts

THE SANWA BANK LIMITED

(Incorporated in Japan with Limited Liability)

NEW DELHI BRANCH

(e) Fixed Assets

Fixed assets are stated at cost less depreciation Depreciation is provided *pro rata* to the period of use on the straight line method at the rates specified in Schedule XIV of the Companies Act 1956 except for improvements on leased premises which are depreciated over the period of lease

(f) Staff Benefits

The Bank has taken a Group Gratuity Policy with the Life Insurance Corporation of India (LIC) under the Group Gratuity (Cash Accumulation) Scheme for the non expatriate staff which covers the full contractual liability towards gratuity in the event of death/ retirement of Branch's employees The premia paid for obtaining this cover is charged to the Profit and Loss Account

(g) Net Profit

The net profit disclosed in the Profit and Loss Account is after *inter alia*

(i) provision for taxes on income in accordance with statutory requirements

(ii) adjustment to the value of current investments and

(iii) other usual and necessary provisions

II Inter Office Borrowings from the Singapore Branch of the Sanwa Bank Limited (Incorporated in Japan with limited liability) amounting to Rs 944 850 (Previous Year Rs 941 175) and balances with other branches of Sanwa Bank Limited (net) amounting to Rs 5 471 (Previous Year (Rs 19 723)) have been consistently shown under Inter Office Adjustments (net) amounting to Rs 939 379 (Previous Year Rs 921 452) under Other Liabilities and Provisions (Schedule 5)

III In case of outstanding forward contracts loss amounting to Rs 3 897 (Previous year Rs 1 986) relating to the Revaluation of Forward contracts has not been accounted for

IV In case of Permanent Investments the differences between the cost and redemption price which had been accrued over the period from acquisition/April 1 1992 (in case of investments carried over from last year) to redemption date and had been recognised as income in earlier years in terms of letter from the RBI DBOD No 841/27 02 003/93 dated February 25 1993 [Phalguna 1914(s)] has been charged off to the Profit and Loss Account under the head of Income on Investments in the Schedule XIII relating to Interest Earned

V Other expenditure under Schedule 16 includes Rs 2 525 pertaining to travelling

VI Figures in Rupees have been rounded off to the nearest thousand

VII Previous year's figures have been regrouped/reclassified to conform to the current year's classification

AUDITORS' REPORT ON THE ACCOUNTS OF THE NEW DELHI BRANCH OF SANWA BANK LIMITED (UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949)

We have examined the Balance Sheet of the New Delhi Branch of The Sanwa Bank Limited (incorporated in Japan with limited liability) as at March 31 1995 and the related Profit and Loss Account for the year ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub sections (1) (2) and (5) of Section 211 and Sub Section (5) of Section 227 of the Companies Act 1956 the financial statements are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956 The financial statements are therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act 1949

Attention is drawn to Note No III appearing in Schedule 17 regarding non provision of Rs 3 897 thousand on account of loss on revaluation of forward foreign exchange contracts Due to the above the profits for the year are overstated to the extent of Rs 3 897 thousand

Subject to the above the accompanying financial statements in our opinion give a true and fair view of the state of affairs of the New Delhi Branch of The Sanwa Bank Limited as at March 31 1995 and of its profit for the year ended on that date Furthermore in our opinion

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them satisfactory

(b) The transactions of the New Delhi Branch which have come to our notice have been within the powers of the New Delhi Branch of The Sanwa Bank Limited

(c) The Balance Sheet and the Profit and Loss Account are in agreement with the books of account, and give the information required by the Companies Act 1956 in the manner so required for banking companies, and

(d) The New Delhi Branch has maintained proper books of account as required by law insofar as appears from our examination of those books

WE'VE COME A LONG WAY IN THE PAST YEAR. YOU CAN TELL BY THE MILESTONES.

The past year has certainly been a remarkable one for us. For even as our superior products help us remain undisputed leaders in the market place, our financial results also give our shareholders, and us, reason to smile. A turnover growth of 24%. Profits before tax at an all time high over Rs. 100 crores. And dividend at 50%. All a measure of the distance we've travelled over 70 years.

✡Turnover up by 24% ✡Profits up by 55%

✡Dividend up to 50%

Ecolc Reform and Environment

The sal adjustment programme (SAP) adopted by the government , of Indushered in major changes in 'business as usual', though none of thcplicitly aimed at environmental concerns. The growth stratelace is built on faith in trickle down and what may be termed long-lalthusian optimism. It does not address the problems of trans: a sustainable economy. While the prospect of growth under the stis, to say the least, uncertain, it is all but certain that both indund environmental degradation will worsen over the medium term; sense, SAP is a gamble against the majority of Indians. Hencthe urgent need for alternative strategies to exploit the comptarities among income gains, employment growth and envintal refurbishment. 1749

Anesant and Tamil Nationalism

The Rule movement in Madras which Annie Besant galvanised into ction caused political opinion to crystallise into Brahmin and non-in political formations. More importantly, the cultural vehe she brought to her practice of nationalism resulted in the gradual emei of a complete and total counter-ideology. The non-brahmin resisto political brahminism evolved into a full-fledged ideology of Tamonalism in the 1930s, engendering a dramatic break in the prog 'Indian' nationalism in the Tamil country. 1768

Sh and Caring

The nce of an income-spreading mec which has been practised in thal encircling net fishery of Ker about half a century shows howbination of inappropriate techy choices coming in the wakee market policies and a nowasingly common pattern of stat nage of rural producers oftebine to create open access cons in common property res and thus put eminently descommunitarian systems of and caring under grein. 1780

Egency in Retrospect

Asongress(I), the perpetrator of nergency, appears to be he for its final eclipse and as thems of the Emergency are in dance, this is an occasion fog beyond condemnation anmpt a more dispassionate unnding of the phenomenon anlace in the evolution of dian polity. 1736

Balpur Riots

Thort of the commission whquired into the Bhagalpur ri October 1989, in which some l, ersons had perished, has br out a typical pattern of co among the police, the bu racy and communal no elements. 1729

Ethics and WAC

Indian archaeologists have largely denied the influence of socio-political contexts on academics. But this has not prevented some from misusing archaeological evidence with catastrophic results. No discussion on the issue was permitted at the World Archaeological Congress (WAC) in New Delhi in December last year, so that eight years after it was formed, the WAC compromised and suppressed free debate on a vital matter. 1725

Spurious Plenty

With the forecast of another normal monsoon, the eighth successive one, and food demand continuing to be constrained by mass poverty, the government's preoccupation on the eve of the monsoon is, alas, with problems of 'plenty'. 1732

Civilisation-Mongering

The recent pronouncements of Senator Jesse Helms, chairman of the foreign relations committee of the US Congress, on India and China continue the tradition of American discourse on foreign policy being dominated by self-righteousness and contempt for others. 1724

American Backyard

What strikes a traveller in Nicaragua is not only the poverty of the people, but also the chaos and the sense of social paralysis. 1734

ERS TO EDITOR

Finance Commission's Award

THIS is with reference to the excellent paper of S Guhan on the Report of the Tenth Finance Commission (April 22). It is not my intention to make any substantive comments, but only to draw attention to two points for the sake of the record.

In his paper, Guhan, while conceding that "in the evolution of Finance Commission awards the TFC has taken a significant step forward in terms of logic, simplicity and equity in adopting identical criteria for the two shareable taxes", also recalls that Raj Krishna had argued this point persuasively as far back as 1978. He then quotes Raj Krishna's views on the contribution criterion in income tax and states that, "while two cheers are due to the TFC for implementing this enlightened rationale, it would have deserved a third if it had shown a decent respect for history by referring to, and acknowledging, the seminal contribution of Raj Krishna to the debate on this issue".

In fact, the views of Raj Krishna, on the issue of the contribution criterion in the distribution of income tax revenue, have been quoted by the Tenth Commission in para 5.32 of its report. The views of C H Hanumantha Rao, a member of the Eighth Commission, agreeing with this view and quoted in the report of that commission, have also been quoted in this para.

Insofar as adopting identical criteria for the distribution of the two shareable taxes is concerned, the views of Raj Krishna had been discussed in detail in the report of the Eighth Finance Commission and that commission agreed with his view that "there is no legal or economic basis for allocating shareable income tax revenue and excise revenue according to different criteria" (para 5.28 of the report). Therefore, that commission recommended that 90 per cent of the states' share of income tax "should be allocated amongst them on the very same principles as those we are applying for allocating the predominant part of their share of excise duties (para 5.29). Since the views of Raj Krishna on this issue had already been accepted by the Eighth Commission, there was no need for them to be again mentioned in the Report of the Tenth Commission.

In regard to the contribution criterion in the distribution of income tax, however, the TFC was indeed breaking new ground and, therefore, the views earlier expressed by Raj Krishna and Hanumantha Rao were both specifically quoted in the report of the TFC. I trust, therefore, that Guhan will now restore that third cheer!

In his Alternative Sche[me] fiscal transfers from the centre t[o] states, Guhan suggests that "*not les*[s] 40 per cent of the centre's aggrega[te] ss tax revenues will be shared wit[h] states" (emphasis in original). He b[ases] his on the fact that the total transfe[rs] uding 'grants for state plans' have more than 40 per cent, as shown in [Table] 18 of his paper. This suggestion [ignor]es the fact that plan transfers to the [states] have been coming not out of the ta[x] pts of the centre but from its deficit. [In] 95-96, the total non-plan expenditure [of the] centre was Rs 1,06,998 crore against [net] ss tax revenue of Rs 1,03,762 crore. [In fact], the forecast of the centre furnis[hed] to the Tenth Commission sought t[o] w that "the centre does not have [adequ]ate resources on the non-plan reve[nue] count to meet its constitutional ob[liga]tion of devolution at existing levels" [(para] 4.7). While this position could not [fully] be accepted by the commission [and] they reassessed the foreçast so that t[here] would be a non-plan revenue surplu[s] ll the fact remains that statutory [transf]ers can be based only on tax recei[pts] nd not on a deficit. Even in the co[mmis]sion's reassessed forecast of the centre['s] ances during the period 1995-200[0] terest payments come to nearly 50 [per] ent of the total tax revenues of the c[entre]. The quantum of statutory transfers t[o] states has to be discussed keeping a[t] t this one fact in view. Whether it c[an] only 29 per cent, as recommended by [the T]enth Commission, or it can be [mo]re is debatable, but it is doubtful wh[ether] t can be 40 per cent, if we accept the p[osi]tion that, neither at the centre nor in the states, should there be a revenue deficit.

B P R VITHAL

Hyderabad

Consumerist India

A TELLING example of the insensitivity of the mindset engendered by the liberalisation process offered itself at a public sector bank in Hyderabad recently. An old gentleman, waiting quietly in a corner, was called to the counter. He shuffled across hopefully, only to be informed very curtly that the amount he wished to withdraw would cut into the minimum deposit of Rs 250. "But my pension itself is only Rs...", he said plaintively. The look of dejection on his face had to be seen to be believed. The cashier, however, with more than a touch of irritation rattled off chapter and verse.

Couldn't the latter have been more civil, spoken more softly? While as a small cog in the wheel he was only following rules laid down ultimately by compradores at the apex of politics and bureaucracy, the sense of power surging through the cashier in telling the poor man off was unmistakable. The way white-collared folk internalise the values and attitudes of their masters is disquieting. The instant case seems to suggest that most public sector bank employees remember their socialism only when privatisation rears its head threatening their jobs. For the rest they are busier articulating demands for all sorts of likes and perks. This is why, in the final analysis they are firmly behind consumerist India contra hand-to-mouth Bharat.

Asking for Trouble

IT is typical of the times that the expert groupe working of the foreign exchange market in India,n as the Sodhani Committee, which was expected to recod measures for the growth of "an active, efficient andy foreign exchange market", should have very self-consy confined itself to the mechanics of the foreign exe market without any concern for the broader edic implications of its proposals. For instance, is the pd setting up of so-called Offshore Banking Units only le issue concerning the foreign exchange market or doeve broader monetary, fiscal and financial policy implis? Likewise, the proposal to permit banks to lend, innd borrow short-term funds up to six months in the as markets has obvious foreign debt implications, ju he suggestion that inter-bank borrowing be excludm banks' demand and time liabilities for CRR and SLR ses raises monetary policy issues.

A little reflection on the unhappy experience of anber of Latin American countries and, on the other hthe lessons of the success of the south-east Asian countriuld immediately make clear the relevance of these que. In many cases in the former group of countries, liberaln of the foreign exchange markets has had to be reverseause the fundamentals were not right in terms of continuscal imbalances, high inflation, low domestic saving arge current account deficits. The south-east Asian cou, on the other hand, followed cautious and gradualisicies towards their foreign exchange operations, esch the glamour of liberalisation till they were sure they haceved an enduring balance on their current accounts. Ong the experience of these countries, and of China now, eishes very clearly is that the flow of foreign direct invest into these countries has not depended in any way on thdence of a free foreign exchange market. These coun quite deliberately put off liberalisation of the financial r and foreign exchange dealings till high levels of domeaving and large and sustainable levels of foreign exchangerves, which are a necessary condition for the growth of ctive, efficient, and orderly foreign exchange market"l been achieved. On the other hand, in our case the forcace of globalisation which the government is pursuing – which will be given a decisive push by the Sodhani Cttee's technical-seeming proposals – could abort thentry's growth process, generating instead massive vies of activity associated with multiple layers of financialings not backed by development of the real sectors of thnomy. The dismal performance of Indian bank branchabroad should have given the Sodhani Committee a clo how important it is for financial activities to be backed by sound and rapid development of the domestic real economy. Take again the committee's recommendation that the RBI's intervention in the foreign exchange market should be selective rather than continuous This will no doubt provide fresh scope for market operators to spread their wings, but will it keep the dollar-rupee rate stable as it has done in the past two-and-a-half years, thereby ensuring relative orderliness in the market even in the face of violent gyrations in the international exchange markets ? Relatively unregulated foreign exchange markets make for greater exchange rate volatility which, as the experience of so many developing countries has shown, is seriously detrimental to external sector performance. In India's case, the foreign exchange reserves of $ 20 billion do not reflect the strength of the domestic economy; the deficit on the current account persists, domestic saving continues to be low and fiscal imbalances remain grave. In this situation, any complacency based on the presumption of stability on the external front is dangerous and the entire edifice of the Sodhani Committee's recommendations, inspired as it is by the interests of market operators, rests on such complacency.

This is not to argue that all foreign exchange dealings should be bureaucratically controlled or that the free market has no role at all. What is sought to be emphasised is the importance of caution and proper sequencing of reform of the different aspects of market operations. A few general ground-rules suggest themselves. First, the experience of the south-east Asian countries teaches us that so-called globalisation is by no means a prerequisite for taking advantage of the opportunities afforded by international goods and currency markets to step up the growth of the domestic economy. Second, hasty espousal of policies ushering in current and capital account convertibility (the Sodhani Committee's recommendations will take the country very close to capital account convertibility) is likely to result in the management of the domestic economy having to surrender all initiative to the global market, the extreme volatility of which is a well established fact. Third, freeing of the foreign exchange market will open the flood-gates for arbitrage operations which can be a major source of destabilisation with a class of rentiers ruling the roost. In such a situation prudential norms by which the Sodhani Committee sets much store cannot be a substitute for restrictions and regulations meant to serve social purposes.

According to the Sodhani Committee, unlike developed markets where transactions are financially driven, the Indian market is dominated by merchant flows. What value addition is likely to be generated in the domestic economy by promoting

multiple financial dealings against such flows? The report has no answer. The committee also believes that the Indian market is skewed in that a handful of public sector banks account for the major share of the merchant business, with the foreign bank branches dominating the inter-bank business. The present system of forward exchange rates reflects just the demand and supply for foreign exchange and not interest rate differentials. The integration of the money and foreign exchange markets and the removal of restrictions on banks' borrowing and lending in the international markets, as recommended by the committee, is expected to augment the supply of foreign exchange and so help reduce the forward premia. But in the medium term these changes could also be a source of serious destabilisation. Fears have already been expressed that the freedom given to companies to hedge on the basis of mere declarations will stimulate speculation. Apart from the destabilisation arising out of the linking of the domestic money market and the foreign exchange market, the scope for speculation by banks and companies will be substantially enhanced by many of the committee's other recommendations.

First, companies will now be permitted to hedge their exposures on the basis of a mere declaration without any documentary evidence such as invoices/confirmed orders/letters of credit as at present. In the opinion of the committee, "it is for the management of a company to ensure that the exposures hedged are need-based and transaction-related". Boards of companies are expected to fix limits for authorised officers to book, cancel and re-book contracts to manage exchange risk. Second, it is urged that the limit on overnight open foreign exchange position against Indian rupees fixed at Rs 15 crore, over-bought or over-sold, be withdrawn and bank management be allowed to fix both overnight and intra-day open exposure limits subject to earmarking a separate minimum capital of 5 per cent of the open exposure limit. Similarly, the aggregate gap limits (AGL) and individual gap limits (IGL) are to be fixed by the managements of banks taking into account their foreign exchange operations, risk-taking capacity, etc. In both cases the limits have to be approved by the RBI. Third, authorised dealers who have the requisite skills, infrastructure and risk-control apparatus and who satisfy capital adequacy norms are to be permitted to initiate cross-currency trading positions in the overseas markets, subject to limits fixed by managements and approved by the RBI; at present they are allowed to do so only to square positions taken in the local market. Fourth, to hasten the integration of the domestic and international markets and the alignment of forward margins in the local inter-bank forward market with interest rate differentials, authorised dealers, apart from being given freedom to initiate cross-currency positions, are to be permitted to lend or invest as well as borrow short-term funds up to six months at market rates in the overseas markets up to specified limits. Fifth, to encourage competition by increasing the number of participants, financial institutions such as IDBI, ICICI, IFCI, SCICI and EXIM Bank, which have restricted foreign exchange licences now, are to be brought on par with commercial banks and allowed to trade in the foreign exchange market as they have large foreign exchange commitments and require their exposures to be covered more efficiently. Sixth, it is suggested that in place of the present passive intervention which has supposedly prevented the efficient determination of the exchange value of the rupee, RBI intervention should be selective. Towards this end the statutory obligation to fix buying and selling rates should be given up and the RBI should be left free to intervene only when it considers such intervention necessary for its policy objectives. Fluctuations would be allowed on both sides and importers and exporters would be able to book their exposures when they consider the rates to be favourable. This is expected to popularise hedging instruments/products in the market. The RBI is also urged to influence forward rates by initiating swaps. Seventh, authorised dealers are to be permitted to determine interest rates on and maturity periods of the FCNR (Banks) deposits, subject to a cap defined with reference to the rates prevailing in the international markets. Eighth, exporters are to be allowed to retain 100 per cent of their export proceeds in foreign currency accounts in India (against 25 per cent for general exporters and 50 per cent for EOUs at present), subject to liquidation of outstanding advances against export bills. Ninth, to facilitate the orderly development of a foreign exchange forward market, as also a derivatives market, in India, inter-bank borrowings are urged to be excluded from demand and time liabilities for CRR and SLR purposes. Finally, several short-term and long-term measures are proposed to popularise the use of options and to widen the scope and reach of derivatives.

Apart from capital adequacy norms, reporting arrangements and the setting up of a foreign exchange clearing house, a major recommendation of the committee relates to the setting up of offshore banking units (OBUs). Banks are to be allowed to set up OBUs using existing branches. They would be virtually tax-free so as to attract funds, essentially for deployment offshore. The committee makes only a perfunctory reference to the impressive body of literature which has almost conclusively established that (a) the scope for business in OBUs and offshore banking centres is likely to be limited unless enormous tax-breaks are given; (b) the ease of transfer of funds between OBUs and domestic units is likely to blur the distinction between the two, with attendant implications for the management of credit policy and domestic foreign exchange markets; and (c) the skills acquired in such organisations at very high cost will be so specialised that they are likely to have very limited applicability in domestic operations. That the separation of OBU activities from the domestic activities of banks is likely to be a myth is suggested by the kind of business that the committee has itself proposed for the former: acceptance of deposits from non-residents and of funds and deposits from exporters and other residents who are eligible to hold foreign currency accounts with Indian banks and lending to non-residents including other OBUs. The easy leakage of offshore funds into the domestic monetary stream, large arbitrage activities, likelihood of illegal money-laundering and heavy supervisory and legal costs will far outweigh the meagre benefits of skill formation, if any at all.

ENVIRONMENT

Technology Change Dilemmas

THE decision of the German government to allow import of Indian textiles, waiving the requirement that they be free from azo dyes, has brought into focus the issue of the impact of global environmental consciousness on third world countries. One fall-out of the azo dyes controversy has been that the concerned ministries in New Delhi have 'expressed concern' that textiles which use these hazardous dyes are injurious to Indian users of the cloth as well, as also to those who manufacture the dyes. This has opened up a range of complex issues.

First, only a small segment of the textile industry is so organised as to allow for effective monitoring of the type of dyes used for colouring the yarn and cloth and for printing. This is even more true of the chemical industry manufacturing organic dyes, of which the azo group of dyes (mainly red and yellow dyes derived from azo benzene) is one category. Even if azo dyes could be eliminated entirely, it will still be necessary to ensure that the alternatives used are safe and environmentally sound. The way the chemical industry is organised – or rather, is not organised – it is impossible to enforce standards for products or for production processes. To ensure environmentally sound and safe products, specifications have to be laid down for products and processes and mechanisms have to be worked out for enforcing standards. In the case of dyes, for instance, requirements for obtaining an eco-friendly label involve

monitoring of the numerous components which make up the dyes. Testing for these every time, say, a textile manufacturer buys a batch of dyes is near-impossible. This in turn would mean that dye-users would opt for 'reliable' sources or, in other words, reputed large companies which presumably satisfy the required standards.

Secondly, the introduction of substitute 'green' products or processes involves a cost factor, the 'transaction cost', which too works against small industries in third world countries. A recent UNCTAD report on the environmental impact on technology transfer recognises that a number of small and medium enterprises could be driven to ruin by high environmental standards. These firms and the labour employed in them would then become the responsibility of the state. In the case of azo dyes, the concerned departments of the Indian government have acknowledged that changeover to safer dyes could render unemployed a large number of workers. The change thus involves financial inputs, which the state is hard put to find. The labour issue has also come up in the case of greenhouse gas emissions, where powerful labour unions, such as the German coal mining union, have opposed the country's climate policy which will eventually put the squeeze on coal mining.

That brings us to the third issue: who is to bear the cost of making technology and products environmentally sound? This is an issue which had come up as early as 1979 at the UN Conference on Science and Technology which first focused attention on technology transfer. At that time the issue was linked to development, while today UNCED's Agenda 21 links it to environment. But then as well as at Rio, the stumbling block has been resources. Agenda 21 declares that "access to and the transfer of environmentally sound technology are essential requirements for sustainable development", but it has left open the question of "financial resources to acquire environmentally sound technology". This issue is coming into focus more clearly in the course of implementing the Global Environment Facility, the first international arrangement which explicitly finances activities in third world countries directed towards reducing CO_2 and other greenhouse gas emissions. The north-south debate has centred on whether the north, which bears the major responsibility for causing the climate problem, should not accept the burden of transferring the required resources and technology so that further damage is not caused to the environment by the use of environmentally-damaging technologies in third world countries.

The UNCTAD report recognises that the "long-standing problem of the divergence in technological trajectories between the north and the south is likely to be exacerbated by environmental requirements". In addition – and this is [illegible] the UNCTAD report interestingly [illegible]t mention – there is the question [illegible]t the emphasis on environmen[illegible]und technologies will mean for th[illegible]h infrastructure which many third [illegible]untries, like India, have created. Ind[illegible]pecially in a liberalising environme[illegible]l opt to buy proven technology [illegible]the north rather than promote in[illegible]s research, especially when the [illegible]to the new technology needs to be [illegible]plished with the shortest possible 'de[illegible]'. Moreover, it is not as if there are available alternatives. In India, and [illegible]st developing countries, little atten[illegible] been made to come to grips wit[illegible] levels and types of technologi[illegible]uts required to make the changeove[illegible]ore environment-friendly processes [illegible]ducts and as a result no comprehe[illegible]programme to undertake relevant re[illegible] in this area has emerged.

Clearly, [illegible]m does not lie in rejecting environm[illegible]sciousness on the ground that this is [illegible]er of concern essentially to the north, as for developing countries it is far [illegible]mportant to cope with the other en[illegible]nent-bound problems of disease a[illegible]nutrition. Certainly, there is no subst[illegible]o allocating more public resources [illegible]man development and welfare. But [illegible]pect of human development is also to[illegible]nise the impact of environmentally [illegible]ndly and unhealthy technologies on [illegible]ple who produce the concerned products [illegible]those who use them. The solution [illegible]identifying the right priorities and wor[illegible]ut a comprehensive environmentally [illegible]cious policy of technology change, [illegible]ling for research and development, w[illegible] emphasis on restructuring and revitalis[illegible]all and medium industries. In the abs[illegible]of such a policy, a north-led enviro[illegible]l movement will increase unempl[illegible]nt in third world countries and endang[illegible] indigenous industrial base.

THE JUDICIARY

Not above Accountability

IN Ind[illegible]tice has become too important a matter [illegible]t left in the hands of the judges. The n[illegible] supervise the functioning of the judici[illegible]d punish erring judges assumes impor[illegible]t in the context of two recent cases [illegible]dicial misdemeanour. Arbitrary judgm[illegible]t that violate fundamental rights as we judicial protection of criminals have [illegible]t the order of the day for a long time [illegible]ur country. But thanks to the involvement of two high-profile individuals – one [illegible]t-setter business tycoon and the other [illegible]werful Congress politician – and the [illegible]ure that the media have given to their [illegible]pective cases, the Indian upper class [illegible]blishment seems to have suddenly discov[illegible]d that its members (like ordin[illegible] citizens) can be vi[illegible] callousness and bestial jail conditions.

In the case of the extradition of the Singapore-based biscuit-baron Rajan Pillai, the Delhi metropolitan magistrate scornfully rejected his plea for treatment in a hospital, in spite of his informing the magistrate that he was suffering from cirrhosis. The next day, in the absence of prompt medical care in Tihar jail (where he had been sent by the magistrate), Pillai died after having been brought in a virtually comatose state to a city hospital. While rejecting Pillai's plea, the magistrate had advised Pillai, "instead of trying to run away to a five-star hospital, he [Pillai] should address himself to the cause of the abnormality of his liver" and with those words he had despatched him off to jail instead of a hospital. Legal experts are right in questioning the magistrate's authority to deny medical treatment to an accused person purely on the basis of his arbitrary assessment of what the accused should do to improve his health. How can a judge usurp the role of a medical expert? Without the necessary expertise, how can he determine whether an accused is feigning illness or is genuinely in need of medical attention?

Yet there are any number of cases, especially in the lower courts, where judges pay little heed to pleas for medical treatment by the accused (often brought before them in a physically battered state after having been tortured in police custody) many of whom eventually die in police lock-ups or jails. The deaths in Delhi's Tihar jail have been widely reported in the press. But since the victims are poor and unknown, they fail to focus national attention on the arbitrary verdicts of callous judges and the inhuman conditions in police lock-ups and jails.

In the second case, a Youth Congress leader who allegedly killed his wife, burnt her body and escaped to Madras was, lo and behold, promptly given anticipatory bail by no less a person than the principal sessions judge. Admitting that he had not bothered even to check the signature on the bail application, the judge later came up with the offhand remark: "In a single day, we pass several dozen bail applications and there is no time or means of scrutinising signatures." Can anyone think of a more extraordinary defence of judicial hamhandedness?

Yet, here again, we have become accustomed to the judiciary resorting to legal prevarications and sophistry in order to allow criminals who are protected by powerful politicians to go scot-free. The mass murderers of the Sikhs in 1984 and the killers of Muslims after the demolition of the Babri mosque are still strutting around fearlessly, in spite of cases having been instituted against them.

Incidentally, as press reports have suggested, it was not the murder of the woman as much as the ghoulish manner of the attempted disposal of the body that

created public revulsion and brought pressure upon the administration to apprehend and punish Sushil Sharma. But counter-pressures from his political patrons – which enabled him to obtain anticipatory bail in Madras - are continuing. It is yet to be seen how the Delhi court's respond to these pressures. There is nothing wrong in the Delhi metropolitan magistrate acceding to the request by Sharma's lawyer that his client be medically examined and allowing the lawyer to be present during Sharma's interrogation. But one wishes judges showed the same good sense when they try cases involving ordinary citizens from obscure and impoverished backgrounds who do not have the advantage of political patronage and press publicity.

With charges of corruption against senior judges and acts of misdemeanour by the lower courts, the reputation of the judiciary has today reached the lowest ebb. It is up to the judges themselves to cleanse their fraternity of charlatans, improve their professional skills and, above all, shed the arrogant habit of passing off-the-cuff remarks in courtrooms. Since no judge is infallible – as is evident from the number of judgments regularly overturned by superior courts – judges should learn to be modest. They must also learn to submit themselves to public scrutiny – and even criticism – instead of threatening action for contempt of court at the drop of a hat. Like members of every public profession, judges are also accountable to society.

BOSNIA

The European Dimension

THE assault on UN-protected enclaves for Muslim refugees by the Bosnian Serbs – they have already taken control of at least one of these enclaves, Srebrenica – has made it clear that the war in Bosnia cannot be brought to a conclusion unless the arms embargo against the Bosnian government is lifted or, alternatively, the western powers take joint military action against the Bosnian Serbs.

The first course of action has long been favoured by the majority in the US Congress; the second – the need for which has so far been only mutedly acknowledged – has been recently advocated by French president Jacques Chirac. Members of the US Congress – mainly the Republicans – must have domestic reasons for advancing it, but there is substance in the argument that the lifting of the arms embargo against the Bosnian government would strengthen it militarily and may enable it to conduct a successful war against the Bosnian Serbs. What appears even more likely is that it would put the Bosnian government in a position to negotiate with the Serbs without yielding much diplomatic ground.

The opposition to the [illegible]g of the embargo, which comes m[illegible] from the governments of Britain, Ge[illegible]y and the US, on the other hand, r[illegible]n flimsy ground. It is argued that it [illegible]l escalate the civil war. Actually, the [illegible]as been in an escalated condition for th[illegible]ears. And a further escalation in it, if [illegible]l it takes place, would scarcely cause [illegible]e damage than it already has. What cli[illegible] the issue in favour of lifting the emba[illegible] that it is likely to bring the war to an [illegible]ooner.

The second argument of th[illegible]pposed to lifting of the embargo, na[illegible] that an intensified war in Bosnia m[illegible]ag them into a larger European conf[illegible]merging from the Balkans, cannot [illegible]o easily dismissed, but on the whole [illegible]ggerates the dangers of a European war. [illegible]rgument is based on the perception [illegible] military humiliation of the Serbs wo[illegible]provoke Russian strategic sensitivities [illegible]e region and would bring the Russian[illegible]ectly on the side of the Serbs. Ho[illegible]er, this perception ignores the curr[illegible]Russian economic and technological de[illegible]ence on the western powers. Due to this [illegible]ndence, the Russian government – even a[illegible]rnment dominated by nationalists – wo[illegible]e loath to plunge itself into a military c[illegible]ct with them.

What could bring about such [illegible]nflict is what has been suggested by [illegible] French president, namely, a joint mil[illegible] action against the Bosnian Serbs. Suc[illegible] action would tread directly on Russia[illegible]rategic toes. Secondly, no Russian reg[illegible] would be able to tolerate such a de[illegible]pment without losing face among its rap[illegible]demo-cratising populace, a majority of[illegible]om are Slavs, the same ethnic group as [illegible]Serbs.

Nevertheless, these consider[illegible]s are precisely what makes this course [illegible]action unlikely. There is also the issue [illegible]gistic and financial viability, with a mi[illegible]um of 2,00,000 troops needed to put it int[illegible]ctice. In an era when economic calcula[illegible]s tend to outweigh strategic ones, not mar[illegible]estern governments would listen to th[illegible]rench plea. Therefore, what the [illegible]ench fulminations against the Bosni[illegible]Serbs actually signify is a division ar[illegible] the western powers on the questions o[illegible]snia. This division, if it widens or gets acc[illegible]ated in the coming days, would be the rea[illegible]ctory of the Serbs against the Bosnian [illegible]lims on a larger scale.

MYANMAR

A Place for the Army

THE unconditional release of Au[illegible] San Suu Kyi, the leader of the democrati[illegible]rces of Myanmar, has been welcomed th[illegible]orld over, but it has also generated a great[illegible]al of speculation regarding the future co[illegible]e of Myanmar politics.

Myanmar, shortly after independence from the British, witnessed a three-decade-long phase of autarky, mostly under the autocratic rule of Ne Win. It was only when the pro-democratic forces coalesced around the leadership of Suu Kyi, daughter of the assassinated national hero, colonel Aung San, that Ne Win was compelled to agree to relinquish office and pave the way for the formation of a representative government. The crackdown on the leaders and supporters of the National League for Democracy (NLD) in 1988 and the eventual arrest of Suu Kyi on July 20, 1989 had made the military junta extremely unpopular with the masses. In the elections in 1990 the NLD captured more than 60 per cent of the votes. The military junta, known as State Law and Order Restoration Council (SLORC), unable to digest the prospect of being abruptly marginalised from Myanmar politics, annulled the mandate of the people and continued to cling to power.

But later events show that the signals the election had sent to the SLORC were not entirely lost on it. The SLORC tried to secure legitimacy for its rule from within and without. It declared a ceasefire with all but one warring ethnic group demanding regional autonomy. While it publicly rebuffed the US threat of economic sanctions in case of failure to restore democracy, it cultivated closeness with ASEAN countries, showing interest in their attempt at 'constructive engagement'. It attended the ASEAN meet held last year in Bangkok on special invitation from the government of Thailand, but was denied membership. Myanmar has been opening up its economy for the past decade and is keen on getting integrated into the regional economy. The SLORC acknowledged that its questionable international reputation on democratic and human rights fronts was coming in its way of improving bilateral ties. Last year it had declared its intention of drafting a constitution, shrewdly ensuring the interests of the military within it. But it soon realised that this process could carry no weight internationally unless it was able to carry with it the various political groups within the country. It was this pressure that resulted in the gradual change of the junta's attitude towards Suu Kyi. Till July last year, the SLORC maintained that it would free Suu Kyi only if she agreed to go abroad for five years. But Suu Kyi remained defiant. Yet the non-confrontationist stand taken by Suu Kyi after her release and her statement mentioning the possibility of a combined military-civilian transitional government indicates that further advance of democracy in Myanmar can take place only after the armed forces have been assured a place in the emerging polity.

INDIAN RAYON AND INDUSTRIES

Multi-Pronged Expansion

AN Aditya Birla group company, Indian Rayon has turned out encouraging results for the year ended March 1995 Turnover increased from Rs 908 crore in 1993-94 to Rs 1,079 crore, an increase of 18 7 per cent, and net profit stood at Rs 132 64 crore compared to Rs 97 86 crore, an increase of over 35 5 per cent Depreciation and interest cost showed nominal increases of 3 16 per cent and 1 46 per cent, respectively The directors have recommended a dividend of 57 5 per cent against 55 per cent last year The company's export performance has been satisfactory Exports during the year under review stood at Rs 140 crore, compared to Rs 106 crore in the previous year, an increase of 32 per cent

The company has attributed its performance to improved operating efficiency resulting from modernisation, expansion and improvement in quality A diversified company Indian Rayon manufactures cement (both grey and white) rayon yarn flax yarn, carbon black and insulators The company occupies a strong position in each of these sectors, thanks both to its large capacities and the relative absence of competition in some of them

The cement division the largest contributor to the company s business, produced 1 68 million tonnes of cement, the highest achieved so far According to the company, production would have been higher but for the perennial problems of poor quality of coal and erratic power supplies Increases in input costs, however, were offset by higher sales realisation The production and sale of white cement increased by 12 and 9 per cent, respectively, over the previous year

White cement is used in the manufacture of paint and mosaic tiles and with the paint industry doing very well the market for white cement has brightened The company is planning to double its capacity from 150,000 mt to 300,000 mt per annum and emerge as the largest white cement producer in the world The company's grey cement plant is also proposed to be expanded to be the largest in the country A split grinding unit of 1 2 mt capacity has been set up at Solapur to take advantage of the sales tax concession in Maharashtra, to which clinker from Gulbarga will be transported As a result the company will have to pay Rs 7 per bag less in sales tax and there will be a 10 to 12 per cent reduction in cost, as transporting clinker is cheaper than transporting cement

The company is one of the most economical producers of carbon black as it uses waste gases to ate power thereby cutting power che carbon black division performewith production reaching an all-time l 43,140 mt against 26,251 mt in thous year, an increase of 64 per cent company's market share increasec per cent from 19 per cent in the pr year

The rovision's performance was satisfactspite two adverse developments vernment slapped an 8 per cent dutscose filament rayon yarn in the 199budget which immediately pushed its and, second, the National Rayon phich had been closed in 1993-94 becarational again The combined effect owo was a slackening of both demandprices Rayon is the closest substitt cotton and with cotton productling around 15 per cent below target, d for rayon and viscose fibres went ules on the other hand did not show a ponding rise because of manufacturmacity exceeding production by around00 tonnes The division performedwith production of VFY filament yarn tog an all-time high of 13 217 mt Exportstered an increase of over 260 per cegnalling acceptance of the the compaproducts in the inter national market division is the first and only VFY facturer in the country to have receivO 9002 accreditation The group plans vest Rs 200 crore in the textiles divisic expand capacities for various categof yarn and fabrics and for back ward ilation projects in worsted spinning

Thedivision performed satisfactorily with ver growing by 29 per cent and expor 56 per cent Exports comprised 56 pat of the division's turnover At the Ra insulator plant the company maintd satisfactory production levels despfive-month long strike, exporting one tof production

Cdition is either negligible or non-existh the field of argon gas where the compis a new entrant Argon is an inert gas l in hi-tech applications and fabrons The supply of this gas in the dom market is limited due to the huge capitpenditure requirement and imports are tgible because of the inflammable natu the gas The year under review was the full year of operation of the company in tlrea The company produced argon usime gases generated by the fertiliser plarf the group company, Indo-Gulf Ferdrs, at Jagdishpur in UP

Tompany has a series of new projects on h. The sea-water magnesia plant by whithe company plans to manufacture 50 Ctpa high quality sintered magnesia fronta water with technical know-how from Austria is likely to be commissioned by September 1996 at an estimated cost of Rs 275 crore Sea water magnesia is high purity magnesia used in manufacture of bricks for lining high temperature furnaces The product is not manufactured in India, demand being met through imports The management expects an addition to turnover of Rs 100 crore following the commissioning of the plant

The company plans to set up a second captive power plant of 20 mv capacity at Rajashree Cement at Malkhed at a cost of Rs 60 crore Another power plant is being set up at the rayon division at Veraval at a capital cost of Rs 74 crore Both these power units are expected to be commissioned in December this year Veraval is also to be the site of a 36,000 tpa caustic soda plant to be set up at a capital outlay of Rs 119 crore with commercial production expected by March 1997 as a part of the company's strategy of achieving backward integration

The company is considering setting up a 4,000 tpa capacity fibre glass plant at an estimated capital outlay of Rs 109 crore The plant is proposed to be located at Alwar in Rajasthan An application for allotment of land has been made and technical collaboration arrangements are being finalised

The company has raised funds through convertible and non convertible debentures (Rs 338 crore) and global depository receipts ($125 million or Rs 392 crore) for its expansion programmes estimated to cost over Rs 1 000 crore The GDR issue was oversubscribed by 13 times and enjoyed initially a premium of 13 per cent over the domestic price now it is quoted at about 3 per cent premium though in terms of issue price it is quoted at a discount of 34 5 per cent.

Indo Gulf Fertilisers and Chemicals Corporation Mangalore Refinery and Petrochemicals Rajashree Polyfil, the company s joint ventures, have performed satisfactorily and also have big expansion projects on hand

The company is one of the co-promoters of Birla Telecom and Birla Communications The former in collaboration with the global telecom giant AT&T will bid for basic telephone services and the latter in collaboration with AT&T and McCaw Cellular Communications will bid for the cellular mobile services

E MERCK (INDIA)

New Strategy

Despite about 80 per cent of the company's pharmaceutical products coming under drug price control E Merck (I), a 51 per cent subsidiary of Merck, Germany, posted a gross profit of Rs 18 6 crore in the year

(Rs lakh)

ended December 1994 against Rs 4 7 crore achieved in 1993 It has been a remarkable turnaround for the company This is so even after adjusting for non-recurring income of Rs 5 50 crore earned from the sale of its chloroquinine phosphate plant to BDH Pharmaceuticals along with the disposing its holding in the latter company

The company s net profit jumped from Rs 4 66 crore to Rs 8 72 crore, notwithstanding a surge in the tax provision from Rs 90 lakh to Rs 7 57 crore and a provision of Rs 2 29 crore for the voluntary retirement scheme (the total cost being Rs 3 49 crore for 146 employees which has brought down the number of employees from 2 098 in 1992 to 1 848 in 1994)

Apart from improved sales better realisations price increases and treasury operations the company attempted a major shift in its strategy There was a fall in interest cost from Rs 9 7 crore to Rs 6 2 crore in 1993 94 thanks to better working capital management according to R L Shenoy, director (finance) This was a direct result of both better cash flow and reduced reliance on external funds

In its eagerness to increase sales at any cost, the company had in 1992 flooded the market with products paying scant attention to demand The market was not ready to accept this and the company had to face a loss with liquidity being a casualty The company has changed its strategy with emphasis now being on demand generation The thrust has shifted to better sales management and liquidity The company claims that it has received help in the form of finance and technical know how from time to time from its parent companies, Chemitra & Emedi of Germany and Merck AG of Switzerland

Merck(I) has diversified interests in pharmaceuticals bulk drugs, reagents, diagnostics and pigments Hansgeorg Brotz, managing director has reason to be happy with the company's performance All the company s divisions have posted profits for 1994, this being the first time when they have done so after the company's inception in India in mid-1981 as a public limited company The company s two key products namely Vitamin E and Envion, are subject to price control, while Cosome, a cough syrup has come out of price control and the mark-up on another product, Emquin has been raised Envion, the company's largest selling drug, accounts for 85 per cent of the market in that category, with Polybion and Neurobiown following a long way behind Of the sales income of Rs 151 6 crore in 1994 (Rs 121 5 crore in 1993) pharmaceutical products accounted for 70 5 per cent against 72 6 per cent in the previous year The sales income of the pharma division has gone up by 21 3 per cent, against 18 5 per cent for reagents,

63 5 per cent for diagnostics and 52.2 per cent for pigments

The company has been phasing out non-profitable items in order to remain competitive In order to rationalise operations the company sold its plant at Indore which manufactured chloroquine phosphate to BDH Pharma This was mainly due to the decrease in offtake of Guaiazulene in the international market The company has decided to concentrate in future on drugs that are not in the ambit of price control

The company plans to import liquid handling equipment and micro wave digesters for sample preparations etc from foreign suppliers It also plans to market the products of its parent company E Merck Biotrol (a French company) Behreng (an affiliate of Hoechst) and Syva in diagnostic products like kits instruments and solutions The company also has an advantage in the mica based pearl lustre pigments that are widely used in cosmetics automobiles paper, plastics textiles and printing inks for gold or silver effects

The export performance of the company has improved over the years Exports in 1994 were Rs 7 09 crore as against Rs 4 46 crore in the previous year The company entered new markets in East Africa countries and Burma and increased its turnover in Sri Lanka and the CIS countries In Sri Lanka the company intends to make available a full range of laboratory chemicals and disinfectants as also vitamin formulations from its Goa plant

NICHOLAS PIRAMAL

Venturing Out

Nicholas Piramal India headed by Ajay Piramal with interests in pharmaceuticals bulk drugs toiletries and glass products has recorded an impressive performance in 1994 95 The company notched up sales of Rs 135 16 crore, up by 27 per cent over Rs 106 11 crore posted in the previous year, an important reason being the new drug price control order in January this year which has improved the company's ratio of decontrolled to controlled products to 57 43 from the earlier 49 51 The increase in sales was also due to the fact that two of the company's ongoing projects, the glass division's project for 18 tonnes per day of borosilicate glass and the Pithampur pharmaceuticals unit, went on full stream during the year

Depreciation charges were up by 70 per cent as compared to the previous year, but this increase was nullified to a certain extent by a fall in the interest costs which came down by 42 per cent from Rs 4 40 crore in 1993-94 to Rs 2 52 crore Provision for taxation increased by just 20 per cent Income rose by 25 per cent for the period under review, mainly because of the returns from investments in shares, government securities and mutual funds Gross profit rose by 61 per cent to Rs 36 48 crore from Rs 22 65 crore in the previous year, while net profit jumped to Rs 26 95 crore – an increase of 59 per cent – from Rs 16 91 crore Enthused by the buoyant performance, the board of directors has recommended an increased dividend of Rs 3 per share for the year as against Rs 2 25 per share paid last year

The company fared extremely well on the export front so much so that it has identified export as a thrust area and expects a further increase in export earnings in the current year Export earnings rose from a modest Rs 3 23 crore in 1993 94 to a whopping Rs 9 17 crore in 1994 95 signifying an increase of 183 per cent Imports went up from Rs 3 64 crore to Rs 7 52 crore, an increase of 106 per cent

The company's project for footcare products, for which Piramal Enterprises had entered into a joint venture agreement with Scholl PCI of the UK is now fully functional and has started the manufacture of Scholl products The execution of the 75 tpd soda lime amber bottle plant project has also commenced and the plant is expected to be fully on stream in the coming year

The company has ambitious plans To cater to the growing market in generics an expansion plan for the manufacturing facilities at Pithampur has been drawn up The expanded capacity would also help the company meet the demand of its joint venture with Allergan of the US for a range of ophthalmic products The expansion plan envisages an investment of Rs 30 crore and would enhance the company's capacity in injections ophthalmics, tablets, etc by over 100 per cent The company sought to finance the expansion by privately placing 30 30 lakh equity shares with FIIs, but the management was not able to utilise the funds garnered for any specific project and these funds found their way into the securities market or into short term lending in the inter corporate deposit market as a result of which investments improved dramatically from a mere Rs 97 lakh to Rs 27 crore

Appreciating the urgency for conservation and reduction in energy costs at all levels, the company has commissioned a 2 mw wind turbine power generation project at Okhamandi in Gujarat The company also has plans to venture outside the country It has signed two memoranda of understanding to set up manufacturing facilities in Botswana and Vietnam The 'first mover advantage' seems to be the rationale for setting up a unit in Vietnam while a well developed infrastructure stable government and relatively low cost of living have led to the choice of Botswana A joint venture agreement has also been entered into with SATTLEC of France for dental care products

New Book from **MD** Publishers of the Humanities, Natural & Social Sciences

CONCEPT AND STRATEGY OF RURAL INDUSTRIAL DEVELOPMENT

By
Ajmer Singh Malik

The present study examines the policies, programmes and organizational set-up for the rural industrial development in India To achieve this objective, the process of rural development should involve intensive efforts for the diversification of economic activities as it helps to provide employment to the surplus labour in the non-agricultural pursuits The book is of great interest of scholars and students, practitioners, administrators and policy makers connected with rural industrial development programmes

American Civilisation-Mongers

GPD

Right from the days of Dulles and McCarthy, American discourse on foreign policy has been dominated by a degree of self-righteousness and a certain contempt for others. The recent pronouncements of Senator Jesse Helms, chairman of the foreign relations committee of the US Congress, on India and China continue this tradition.

WE have never been to the US. So we could be easily forgiven if we did not quite understand or appreciate the way people, especially politicians, there speak. Not so long ago the then secretary of state had thundered that it was the US more than any other power or set of reasons that had been responsible for the fall of socialism and the Soviet Union. It is not relevant if he was right or wrong. What is relevant is that no statesman from any of the other advanced capitalist states would have actually made a statement of that kind. One cannot imagine a French or a German foreign minister actually making that kind of statement even if either France or Germany had been responsible for the political earthquake in eastern Europe. Baker however was not constrained by diplomatic niceties. He went ahead and claimed credit for his country. Earlier Reagan had described the Soviet Union as evil empire. Obviously American statesmen do not set much store by diplomatic understatement. There must be something in that culture which encourages a certain brashness in public statements. If you are an American you can get away with a lot. That must be the reigning logic on the banks of the Potomac. That was perhaps the reason why the *Washington Post* had editorially pronounced in 1989 that Deng Xiaoping had gone senile. We had referred to that infamous editorial in these columns not so long ago. We have not seen *Washington Post* lately but it would not be surprising if it found almost the entire Chinese leadership senile because of the tough statements that have emanated from Beijing on the question of the American visa to Lee Teng hui, president of Republic of China on Taiwan.

In any event the American discourse on foreign policy right from the days of Dulles and McCarthy has been dominated by a degree of self righteousness and a certain contempt for others. This is not to say that others, especially the Europeans, do not share the US's views. They probably do. What distinguishes the American discourse from its European counterpart is that American politicians and statesmen actually use language which is manifestly arrogant.

In keeping with this tradition senator Jesse Helms, chairman of the foreign relations committee of the US Congress has come out with yet another American gem.

Helms has defended India's rationale for maintaining its nuclear weapons option. We have never really fully understood the meaning of maintaining the nuclear option. Being nuclear is like being a virgin. Either you are a nuclear power or you are not. It does not make much sense to maintain an option. Nobody is impressed by it. At any rate it makes little political or power sense. Now that Senator Helms has defended India's maintaining the nuclear option it might be difficult to persuade our elite that there is no such thing as a nuclear option. To maintain a nuclear option is effectively to be non nuclear.

The interesting thing about Senator Helms' position however, is his juxtaposing the Indian position with China's nuclear capabilities. On the face of it his position that India will want to keep its nuclear option as long as it has a nuclear power like China as its neighbour is not entirely unconvincing. What is wrong about the proposition is that Senator Helms does not take his logic to its end. If nuclear China is a threat to India as Senator Helms obviously seems to think he then has to support India's bomb. This would be even more necessary in view of his having told Benazir Bhutto categorically you do when the latter denied that Pakistan had a nuclear programme. But Helms does not support India's bomb. He merely supports India maintaining the option of nuclear virginity. He is merely interested in encouraging some anti China rhetoric in India if on nothing else then on the question of China's nuclear weapons build-up. Incidentally China has been a nuclear weapons power for the last three decades. Our so called option is equally old. To talk now of the Chinese nuclear build up is indeed flogging a dead horse. Helms might be brusque in his language, but he is nobody's fool. He is doing it for a purpose. It is a part of the cold war against China. Whatever view we might take of the nuclear build up by China let us hope we are not persuaded by Senator Helms to think otherwise, just because he happens to be "for the unity and integrity of India" and against India's balkanisation".

To return in the theme of American discourse. Senator Helms made a statement that is extraordinary to put it mildly. He came out with a formulation which would put more than a century of solid American scholarship on China to shame. He came out with the formulation that 'China is barbaric". Unfortunately he again juxtaposed his assessment of China with that of India. 'India is a nation of well-intentioned people', said Senator Helms. Two nations have been insulted in one go. India is not civilised in Helms' view. It is only a nation of well intentioned people. China is positively barbaric. Two ancient civilisations have been brushed aside in just two sentences. It takes some courage to describe China as barbaric'. It is time somebody looked after the education of American Senators.

France has only recently exploded a nuclear weapon. One is reasonably certain that Senator Helms would not describe France as barbaric. The post modern world is the world of Euro American dominance. In that world China can only be barbaric and India can at best be a nation of well intentioned people. What is amazing about the whole business is that the chairman of the US foreign relations committee can make such irresponsible and nearly racist statements. What does Helms know of civilisation a man in a Beijing street can legitimately ask. Yet there is a small and a totally unintended point about Helms' statement. It might remind the Chinese and the Indians of what the advanced capitalist (in other words, white, as some might legitimately point out) world thinks of them. No small mercy in our times, except that there are few in New Delhi to take umbrage at this patronising by Senator Helms. The Chinese are already very angry with the Americans anyway and they will react to this in some manner at some time.

Western concern with Chinese barbarism' is more than a century old, however Engels has placed the colonial outlook in its proper context. In his writings on 'Persia and China', he showed his contemporary 'avataras' of Helms their place when he said that "civilisation-mongers who throw hot shells on a defenceless city and add rape to murder may call the system cowardly, barbarous, atrocious but what matters it to the Chinese if it be but successful?"

The term civilisation-mongers still rings true. Senator Helms has ensured it. American civilisation-mongers like Senator Helms do not read Engels. One does not know if they have even heard of him. All the same, Helms has proved Engels right without knowing it.

Ethics, Archaeology and World Archaeological Congress

Nandini Rao

Indian archaeologists have largely denied the influence of socio-political contexts on academics But this has not prevented some from (mis)using archaeological evidence with catastrophic results No discussion on the issue was permitted at the World Archaeological Congress (WAC) in New Delhi in December last year, so that eight years after it was formed, the WAC compromised and suppressed free debate on a vital matter

THE recognition in the west that academics is influenced by its socio political context led to the demand for reflexive archaeology and to the formation in 1986, by the politically aware of the World Archaeological Congress (WAC) WAC explicitly recognises the socio political context of archaeological practice, and archaeology's political social *and* academic responsibilities The Congress which meets every four years met in New Delhi in December 1994

Indian archaeologists have largely denied the influence of socio political contexts on academics But this has not prevented some from (mis)using archaeological evidence with catastrophic results No discussion on the issue was permitted at the Congress so that eight years after it was formed the WAC compromised and suppressed free debate on a vital matter

This essay outlines the genesis of WAC and the reasons it was formed before analysing the Indian context of the third meeting of the Congress It also examines the response of (Indian and Western) archaeologists at WAC to the protest against the abuse of archaeology and calls for a reflection on whether WAC has achieved its objective of becoming a relevant world organisation

Genesis of the World Archaeological Congress (WAC)

It is often assumed that archaeology is, or should aspire to be the value-free investigation and reconstruction of past societies This has meant that an awareness of its political nature did not emerge until recently Through the 1970s and 1980s, the contributions of Roland Barthes, Michel Foucault Edward Said and others influenced archaeology in Europe especially, but also the US With this came the demand for reflexive academics and the recognition/admission that the past is reconstructed as a strategic reflection of the present The question of whether it ought to remain an unthinking acceptance of the *status quo* or become a critical/emancipatory practice began to be asked increasingly A significant number still argue, however, that archaeology (and all academics) is value free Others disagree maintaining that this is neither possible, nor perhaps a desirable goal and such concepts as 'power', 'ideology' and 'praxis' derived from Marxist, Critical Theoretical and other Social Scientific thinking, embodie[d] a change both substantive and effecting the constitutive premises for the practice of archaeology" [Patap and Rao 1986 4] Miller's *Archaeology and Development* (1980) and Langford's *Our Heritage Your Playground* (1983) revealed the inherently political nature of archaeological practice and this was underscored by WAC-1 and the developments preceding it

In *Academic Freedom and Apartheid*, Peter Ucko (1987) explains how and why the WAC came into being From the moribund (at least from the perspective of the non-European world) and Eurocentric International Union of Pre and Proto-historic Sciences (IUPPS) set up in 1931 to WAC in 1986, archaeology had come a long way Until 1986, the IUPPS was "the only institution with an international responsibility for archaeology" [Champion and Shennan 1986 109] but part of the problem lay in the fact that in the case of the IUPPS at least 'international really meant issues that interested European This was evident in the facts that the meetings held every four years were only once ever held outside Europe and the sessions at the meetings were "organised around European perceptions of archaeology" and what European archaeologists considered to be of interest [ibid 110] There was also a shocking lack of understanding of archaeological issues in the rest of the world (including the Americas) and sessions on the Iron Age of America continued to be held although no such age had been known to exist! There was uncertainty in non-European countries as to the structure of the IUPPS and few non-European archaeologists attended either the congresses or the smaller meetings organised between The IUPPS had obviously "failed to adjust to the changing nature of the world and of archaeology in particular" [ibid 109]

Ucko, who had the task of organising the 1986 IUPPS Congress (later the WAC) wanted to ensure that as many countries as possible were represented at the Congress He was concerned that the IUPPS was undemocratic, that few knew how it functioned or how it was organised! Furthermore, to Ucko, third and fourth world participation at the Congress was crucial He also wanted it to be a serious academic congress and hoped to create an organisation through which 'a secure future for world archaeology" could be established, and "make its contribution to the recognition of the unique variety of human cultures, past and present' [Ucko 1987 5] Students were encouraged to participate as were those involved in reconstructing/working with the past but who had previously not necessarily been recognised as archaeologists [ibid 25-26] It was evident that the 1986 Congress woud be a path breaker

In the years immediately before and after WAC 1, archaeologists in Europe and the US were questioning much of what the discipline was predicated on However, developments in the rest of the world continued largely to be ignored Volumes analysing and tracing theoretical developments and disciplinary change ignored those occurring in the south [2] A disciplinary 'lag' was soon evident too, as turgid texts on theoretical archaeology became common in western Europe and the US, while in India, the data heavy descriptions of carefully and scientifically' excavated material continued to be regarded as crucial even the 'real stuff' Here post processual, feminist and critical archaeology viewed with suspicion as distant theoretical rumblings, are considered by most to have little to do with what constitutes 'real' archaeology The 'lag' became more pronounced as scholars in the west increasingly accepted that the socio-political context of archaeological practice influenced the discipline [3] Indian archaeologists by and large, do not accept this, continuing to view archaeology – especially archaeology which incorporates the use of scientific techniques as being above and incorruptible by socio politics

Against this background, British archaeologist Steve Shennan's seconding of the amendment leading to the motion at the meeting of the Pan African Association on Prehistory and Related Studies (in Jos in 1983), banning contact with South Africa was bound to have far-reaching consequences An immediate fall out was that South Africa and Namibia were banned from the 1986 Congress and the reverberations of this ban soon began to resound Differences in perspective between

scholars came sharply into focus and the growing concern of some among them over the refusal of others to see the obvious linkages between academics and socio politics was reflected in the publishing of *Archaeology and Politics*, the fifth volume of the *Archaeological Review from Cambridge* The volume was amongst the first few to overtly acknowledge the inherently political nature of archaeology and revealed the ways in which the modern nation states and the bourgeoisie used history and archaeology to oppress groups maintain the *status quo* and create myths to legitimise their ideologies and actions

Shennan made the WAC reflect in action [Ucko 1987 37 38 53 54] what had until then been merely an important concern', by seconding the amendment leading to the motion, he ensured that archaeologists saw the relation between archaeology and politics and that archaeology *was* in fact practised within a political context revealing its social responsibility beyond its essentially academic function" (WAC Aims and Application for Membership) Shennan's action left the organisers of WAC little choice After working hard at making the 1986 Congress something worthwhile, this move nearly resulted in its being scrapped altogether The archaeological community was cleaved in two with some supporting the ban on South African participation and others vociferously objecting to what they saw as an infringement of 'academic freedom' [Shaw 1986] Ucko himself initially wavered ('God knows what you have done to our Congress" he had said to Shennan at the time ibid 54) before taking the pro ban stand

I will not discuss the pro anti ban arguments here except to say that academic freedom in the context of South Africa where apartheid was still a way of life, meant little and to those from the third and fourth worlds who saw oppression expressed (at international and national levels) in various ways, objections to an infringement of academic freedom seemed to be somewhat self-indulgent We hoped expected and anticipated that through the WAC archaeologists would finally admit that reconstructing the past was also a political enterprise and that people who dealt with (and in) the past had a social and political responsibility

Those who felt that archaeology was in some way reduced through the recognition of this responsibility were legion and they expressed their anger at the ban in surprisingly virulent ways For perhaps the first time in the history of the discipline archaeologists were called upon to take a stand which would be reflected by their participation (or lack of) at the 1986 Congress Many stayed away, protesting against the ban and what they saw to be the resultant rump congress (as the London *Times* had called it) Despite the odds the World Archaeological Congress did take place and was a remarkable success " not only had the WAC succeeded in being a world event it also re-directed the course of archaeology, irrevocably, into a new direction' [Hubert in Ucko 1987 164] The statement succinctly encapsulates the significance of WAC 1

Ethics Ayodhya and WAC-3

In 1986 when WAC 1 was held, most Indian archaeologists claimed they were against apartheid but not against South African archaeologists' and maintained that archaeology and apartheid belonged in mutually exclusive domains the former in academics and the latter in politics - the one being an objective' and 'scientific' study of the past and the other, the concern of a bunch of disreputable and corrupt people ' Any acknowledgement or discussion of the relationship between politics and archaeology remains taboo in India and Kossinna's dabblings in his Aryan theories have in common understanding become *the* symbol of archaeological politics [Philip and Rao 1986 3] [5]

Discussions with several Indian archaeologists who went to Southampton revealed that their participation in WAC 1 in no way reflected their stand on the issue of the ban They were at Southampton because WAC 1 provided a rare opportunity one where several hundred well known scholars were to discuss their work, and where funds enabling third/fourth world participation were available Few who went were in any way concerned about the South African issue and if they were, their concern was primarily that archaeology was being politicised Such a view of the relationship between politics and archaeology remains in India despite the fact that recently archaeology has become embroiled in an obvious political controversy that of the Babri masjid Ram Janmabhoomi

The sharply political nature of archaeology was recently revealed when rival groups laid claim to a 'sacred space' (Babri masjid Ram Janmabhoomi) The groups used historical (colonial documents and police records) and archaeological evidence (reports – mainly unpublished of excavations conducted) as well as myth oral tradition and finally also emotion to legitimise these claims The outcome is as well known, has been catastrophic in terms of the violence and bloodshed that have resulted

Ethics and Archaeology

The controversy being well known will not be recounted here except to emphasise that archaeologists and historians have provided 'evidence' and opinions on the issue of whether or not a temple existed below the mosque [Gopal 1991, Historians' Forum and Mandal 1993, and Srivastava 1991] The considerable debate on the Babri masjid Ram Janmabhoomi issue has focused largely on the interpretation of 'facts' – always a shaky proposition, more so in archaeology and especially so in the circumstances However, the issue has perhaps more to do with ethics than with archaeology and archaeological evidence [6]

In the post-colonial context, when Indian identity (reduced and denigrated in the encounter with colonialism and partition) was sought to be re-created, tradition and continuity were emphasised and Indian culture was proclaimed to be unsullied by external' (especially Islamic and colonial) contact A Hindu resurgence and the creation of Muslim Pakistan directed in some ways the course of Indian identity-formation towards the manipulation of symbols from a pre-Muslim' past Archaeologists and historians contributed in no small measure to the re creation of the post colonial Indian identity Archaeology became centred largely around the excavation of pre-Mughal and pre Muslim eras (i e, pre eleventh century AD) with an emphasis on the Guptan age (beween the fourth and sixth centuries AD, seen as the period when Hinduism was firmly established) [7] Importance was also given to locating on *terra firma* events and places mentioned in shifting and polyvalent ancient Hindu' texts Thus, projects such as the archaeology of the *Ramayan* sites among others were undertaken In the mid 1970s, the areas around the Babri masjid were excavated in order to identify their relation with the *Ramayana* The reports of the findings [*IAR* 1976 77] reveal no evidence of either a temple commemorating Rama's birth or a Rama cult centre [8]

Evidently Islam, perceived as unambiguous with its focal point defined at Mecca required an 'answer from ambiguous, multi-vocal Hinduism and in the post-colonial era, Ayodhya began to be identified in the Hindu mind with the absolute position that Mecca appeared to have in the Muslim [9] The focus of this identification appears to have become the Babri masjid Although archaeological excavations in the area reveal no evidence of a temple or Rama cult the Hindus found in it, their answer to Mecca Prior to the destruction of the mosque, the call to 'liberate' Rama from the 'prison' of the mosque, served to unify opposed, even warring Hindu factions albeit superficially

As the country experienced a Hindu resurgence the excavator of the areas around the mosque who had reported [*IAR* 1976 77] nothing of importance, stated later in 1990, that evidence of a temple had, in fact been found in below-mosque strata Although this announcement has not been accepted entirely by the archaeological community, it provided the fundamentalists with another of the weapons they needed Finally, when the mosque was demolished by Hindu fundamentalists in 1992 few archaeologists protested publicly either at the destruction of an ancient monument, or at the revoking of the earlier statement made by the excavator in *IAR*, 1976-77, which was really tantamount to the manipulation of data Those who did protest were viewed as 'reducing' archaeology to the level of politics Once more, as in 1986, mainstream Indian archaeologists equated the taking of

a stand against [illegible] being political. The Indian Archaeological Society was one of the few social science bodies that did not pass a resolution condemning the destruction of the mosque Condemning the destruction has been viewed as being 'political', while *not* doing so has been seen as keeping 'clean' and refraining from 'dirtying' the hands in the 'political mess' Such a desire to keep from taking (political') stands has characterised Indian archaeologists, even members of the WAC This is curious, since the WAC states that it "is based on the explicit recognition of the historical and social role and political context of archaeological enquiry and has' defined its role beyond its essentially academic functions and appreciates that archaeology has a social as well as an academic responsibility' (WAC Aims and Application for Membership) Members evidently do not see the contradiction in holding the views they do while simultaneously belonging to the WAC community

Archaeology Politics and WAC 3

Hence when WAC 3 was to be held in India, most archaeologists here did not consider it of significance that some of the organisers had been known to have (ab)used archaeology in the Babri masjid issue There were people who were always at the helm – at conferences seminars, national and international and their being invited to take up key positions in the management of WAC 3 was not seen as unusual To the organisers having these persons on the committee must have seemed expedient On reflection protests began to be registered Of course some archaeologists whose jobs or grants could have been at stake were wary of taking a stand against the establishment (in *Academic Freedom and Apartheid* Ucko reports how several people in the US who supported the ban against South African/ Namibian participation at WAC 1 were warned that their grants would be cut or their jobs taken) and it was left to those outside the system to protest against the misuse of archaeology and against the inclusion of those who had misused it, in the active organisation of WAC-3 It is also significant that the first people to protest were from a department of history among them were only a couple of archaeologists But the WAC would go on without them since they had decided to boycott the event Later (1994) some archaeologists protested and decided *not* to boycott the WAC

Significantly, at the inter-congress meeting of the WAC Executive at Mombassa, in 1993, the destruction of the mosque had been noted and the attempt to condemn the destruction by WAC was thwarted by the Indian representatives However, the Executive did not consider it essential to keep participants/delegates informed and most arrived in Delhi without any knowledge of the issue [Colley 1995] Surprisingly, the Executive appears not to have considered the implications for the organisation, of [illegible] who actively supported the destruction of the mosque Even more surprisingly, the WAC Executive did not consider it necessary, after Mombassa, to organise a session to discuss the issue and it was left to a small group of Indians to attempt to do so

The group circulated a letter (signed by one member) to some archaeologists around the world and suggested that the situation called for a special session to reflect on the issue of the Babri masjid in the context of WAC and on the WAC itself on why it came into being and what it stands for The session could also help reiterate some of the early concerns that had been identified by WAC Such reflection undertaken seriously is obviously a matter of concern as it could result in radical alterations of existing power relations and structures While several people supported such a session here were others who continued to feel that the session would only push archaeology further into the quagmire of politics and still others who felt that the protest had come too late Ironically among those who felt the protest had been registered late were some who must have known that the WAC Executive had taken note of the destruction of the mosque at the meeting in Mombassa! Till date no one has queried the fact that while WAC's lofty aims condemn uncritical partisan academics the executive meeting at Mombassa was content to let the involvement of some of its members in the abuse of archaeology for political purposes pass

As it turned out the organisers ensured that neither was the special session to reflect on the WAC held in Delhi, nor was any discussion permitted on the Babri masjid issue and the outgoing president of the WAC was compelled to compromise the principles of the Congress and declare that no discussion on Ayodhya would be permitted within the Congress Left without an option those protesting against the inaction of WAC against (and thereby the condoning of) archaeologists clearly known to have misused archaeology, decided to use the Plenary Session as a forum in which to voice their protests Resolutions condemning the destruction of ancient monuments, the involvement of persons with partisan interests in the WAC and decrying the prevention of free and untrammelled' debate at the Congress were to be proposed, debated and voted on Unfortunately the Plenary Session of WAC-3 was reduced to complete chaos Those opposed to the resolutions prevented discussions and a vote The chairman dissolved the session and a meeting of the Executive Council was called

Interestingly although most Indian participants at the Congress were against the resolutions put forward condemning the destruction of ancient monuments and reiterating WAC's commitment to recognising the socio-political context of archaeological practice, the Council which met immediately after the dissolving of the Plenary, adopted and then passed these [illegible] some reflection. If indeed most Indians present were against the resolution and felt strongly that archaeology and politics have no truck with each other, ought they to have joined a Congress that explicitly acknowledges the socio-political context of academics and archaeology? Further, a Council that appears not to represent the views of a majority of the delegates to the third Congress seems rather at variance with the stated intentions of WAC

There is another point that must be reckoned with The quiet and disciplined Council meeting after the chaos of the Plenary Session a meeting at which resolutions were passed in a sensible, reasonable manner could easily be constructed to exemplify the split between good reason' and the disorder that is expected at non Western gatherings The Council meeting could be identified as just one more way of re-asserting 'western rationality and reason amidst the 'chaos'/ emotionalism that is thought to typify the south

Events at WAC 3 suggest that many western academics were either highly confused by the whole issue or were not really that interested [Colley 1995 18] Does this mean then that once more, at an international forum matters of import' are only those that are of concern to academics from the west? How do we purport to develop a One World Archaeology' if members of WAC do not interest themselves in issues where archaeology has been used to further fundamentalism to a terrifying degree?

Colley goes so far as to say that there are two sides to the Ayodhya issue (Who was correct? That surely is a matter of political opinion p 17) and since she was uninformed and confused she had no opinion on the matter Such a position taken by a WAC member is remarkable as the issue brought into the real world what WAC claims to stand for in the comfortable confines of academe This confusion or lack of interest has not, strangely, prevented some *post facto* interest which resulted in the rapid churning out of a paper in which events are distanced' and the physical endurance tests' the participants were subject to ('Delhi is not an easy place for the average western visitor you can't breathe the air drink the water or eat most of the food without getting sick', p 15) appear to have made as much of an impact as the academic sessions and the Ayodhya issue

It is essential for WAC and members of the organisation to critically review what occurred at Ayodhya and subsequently at WAC 3, if WAC must be of contemporary relevance The special session that had been suggested to reflect on the WAC would have been the ideal forum within which to debate the issues of rival claims to sacred places [10] the abuse of archaeology for political purposes and of whether in fact the WAC had succeeded in attaining its objectives (of breaking hegemonic domination in archaeology, of providing a forum for

a space for regional and social expressions) It would also have provided the much-required forum to discuss the contemporary violent expressions that regionalism and ethnicity have taken and to analyse the fall out of the recent rejection of western rationality as the 'universal' one The discourse emanating from this rejection has been somewhat simplistic in its understanding of the 'other' for which it aims to provide a space It has been rather blinded to the fact that the 'other' is not a harmonious, monolithic entity [Rao 1994] It is critical to examine the current meteoric rise of violent extremist/nationalistic rationalities (and consider the voices raised in protest against this) as these are evidently not at play in India alone and to investigate the space between western (till recently the 'universal') rationality and regional/ethnic chauvinism If the WAC refuses to permit such deliberation it will have failed to have moved from its 1986 position of critiquing/contesting what existed at the time to developing alternative archaeologies and to becoming the relevant contemporary archaeological organisation

The WAC is beyond doubt a well meaning organisation that was set up with idealism and the determination that members would work together while also furthering ethical research practices Members of WAC would not wish to stand aside and condone by inaction since they are 'immersed in the evidence of man's inhumanity to man over many time periods and in countless areas of the world [Ucko 1987 xi] But these ideals appear to be contrary to the events played out at WAC 3 WAC is the poorer for not permitting a debate on itself, its genesis, development and the fact that it 'condone[d] by inaction' the usurpation by chauvinists of the third Congress held in India in December 1994

Notes

[An earlier and shorter version of this paper was published in *Trabajos de Prehistoria*, Madrid I thank J Criado A Hernando M I Navarrete and M J Tillon for their comments Roland Fletcher Rhys Jones Robert Layton and Colin Renfrew for the discussions we had R Hoskote D Mandal R S Sharma K M Shrimali and R Thapar for the conversations held over the years G Abungu R Bewley R Borst I Hodder P Lane C R Reddy and B Olsen provided much needed support]

1 Unfortunately the WAC has not entirely overcome this problem and the structure of its organisation remains a mystery to many Most of us do not know whether we are members of WAC or merely members of a Congress We receive no information newsletters or bulletins Even while stating that the WAC was organised in the most democratic of ways Ucko mentions that he wanted to ensure that the right participants from each country could really get the grants they needed to be able to attend' WAC 1 (1987 20) One wonders how he was able to decide 'right' from wrong participant

2 I have used the w... 'Third' and 'Fourth Worlds' interchangeably. Further, I have used the term 'West' to indicate the wealthier, more dominant nations of the world, including among others, the USA, Australia and those in Europe

3 Several archaeologists in the West still do not accept this, but in India there are even fewer who do and their voices are rarely heard

4 I will not discuss here the notion that politics and academics belong in different domains wherein the latter is seen to be neutral and value free Nor will I discuss the notion widely held among Indian archaeologists that incorporating scientific techniques into archaeology has made it into a 'scientific' and objective discipline and therefore ensured that socio politics does not impinge upon it [for a discussion see Rao 1987]

5 Although Said emphasised a decade ago (1985 10) that No one has ever devised a method for detaching the scholar from the circumstances of life from the fact of his involvement (conscious or unconscious) with a class a set of beliefs a social position or simply from the mere activity of being a member of society and that these 'continue to bear on what he does professionally few Indian archaeologists are willing to acknowledge the influence of the socio political context on contemporary archaeological practice

6 The view increasingly held today that a fact is its interpretation can lend itself easily to manipulation and can be dangerous In the Babri masjid issue for instance this position could be used to justify the temple below mosque interpretation What is of concern then is the question of ethics and an understanding of historiography and archaeology Gopal et al 1991 have elegantly demonstrated that much of the temple below mosque interpretation is based on poor historical reconstruction But finally it is essential to examine whether archaeology is about destroying existing monuments to avenge perceived historical injustices or about understanding the past

7 What is invariably overlooked however is the fact that the category Hinduism serves little purpose in a Gupta context The period witnessed the recension of old texts allowing for new gods and cults The old Vedic Brahmanism yielded to a Pauranicism with elements drawn from Roman Mahayan and Chthonic elements [cf Zimmer 1948 Campbell 1962] There is a need to critically re examine the received truth of Gupta Hinduism/Nationalism As Kosambi stated (1956) It is not the Guptas who revived nationalism [but] nationalism which revived the Guptas It must also be noted that there is a vast difference between Guptan and contemporary Hindu Right versions of Hinduism [R Hoskote pers comm]

8 Sankalia (1973 1982) who wrote extensively on the *Ramayana* and archaeology finally held that If indeed Rama was a historical figure his area of operation was severely limited and the superhuman feats ascribed to him were no less than the exercise of poetic licence by Valmiki"

9 I thank R Hoskote for the discussion we had on this

10 In this context it is essential to examine critically the issue of 'returning sacred places which has I believe, been approached in a rather simplistic manner in the West Serious reflection is required on the issue as is evident from the fact that it is an extremely complex and the Americas?), as several communities have, over centuries, claimed sites as being sacred to them Through history, sacred places have been used by successive groups to inscribe their power over the preceding ones Over the Ayodhya issue, the Hindu Right was confident of WAC support to its claim since the demand was for the returning of a 'sacred place But Ayodhya has been sacred/important to many [Rao 1994] the British colonialists to whom its conquest marked the end of the preceding Mughal era the Jains, Buddhists Shaivas and Vaishnavas (who had bloody battles to retain it and re inscribe their power through control of it) and the Muslims Who will return it then? and to whom?

Bhagalpur Riot Inquiry Commission Report

Asghar Ali Engineer

Inquiry into Bhagalpur riots of 1989 reveals how rumours and cooked up stories conspire to cover the collusion between the police, the bureaucracy and the communal elements

IT would be no exaggeration to maintain that the Bhagalpur riot of October 1989 was one of the major riots of the post independence India More than 1 000 people perished and many more were permanently maimed Property worth crores of rupees was destroyed and the riots left permanent scar on the minds of several thousands of people Bhagalpur riots were a worst example of religious frenzy and communal madness They also show how for the sake of capturing votes the communalists brought about extensive destruction and how entire secular political discourse was thoroughly communalised No secular space was left for any kind of dialogue between the two major communities

It was thought that democratic and secular polity and democratic process of governance were most perfect Little did we know how democracy can be manipulated cleverly by the powerful vested interests In fact at times one wonders how easily democracy can be manoeuvred to fulfil one's lust for power No wonder then that independent India has seen a series of devastating communal riots beginning with Jabalpur in 1962 One does not know how many more such riots will occur in our democratic secular country

Most of the riots which took place from early 1980s onwards were mainly due to the emergence of Hindutva forces, clandestinely patronised by the ruling Congress Party The confrontationist policy adopted by some Muslim leaders during the Shah Bano controversy lent further edge to the Hindutva brigade Thus Hindu communalists and Muslim fundamentalists reinforced each other and communalism became a most dreaded challenge for the unity and integrity of the country The Shah Bano controversy provided the much sought after excuse for the Hindutva brigade to launch the Ram Janmabhoomi movement This movement more politically than religiously inspired, captured hearts and minds of many middle class Hindus providing legitimacy to the VHP BJP brand of politics In every nook and corner of the country Ramshila pujan processions were taken out causing either communal tension or eruption of violence Bhagalpur riots were result of such a procession During and after the riots there were allegations and counter-allegations The Hindu communalists maintained that the riots were pre planned by the Muslims, the Muslims, on the other hand alleged that the Hindus were responsible for it

A Commission of Inquiry was appointed to go into the causes of the riots Justices Ram Nandan Prasad as the chairman, and Ramchandra Prasad Sinha and S Shamsul Hasan as members constituted the Commission of Inquiry In the beginning the commission could not function smoothly The government was also callous towards it Proper staff was not sanctioned Also the commission faced many controversies No wonder then the commission took unexceptionably long duration to produce its report which comprises 323 type written pages The report was submitted almost after five years in March 1995 The report it must be said is very well researched one The honourable judges have examined all relevant evidence oral as well as documentary quite painstakingly and have drawn their conclusions impartially The BJP and the police have been severely criticised for their role We will throw more light on this little later

The commission tries to go into the most vital aspects of the eruption of communal violence was it a pre planned one and if so who was responsible for it? Also what was the role of the administration and the police? Did they discharge their duties honourably or were they also swayed by the communal passions? The report examines in detail the sequence of events on October 24 1989 The sequence in which events took place was crucial to reach certain conclusions regarding the sparking off of the riots

Sequence of Events

The commission report in its introductory part observes Bhagalpur has been prone to communal disturbances and had witnessed communal clashes in 1924 1936 1946 and 1967, but all the previous clashes were practically confined to Bhagalpur town and had continued for a very short period They pale into insignificance before the present communal disturbances The present communal disturbances (i e, of October 1989) surpass all the previous disturbances The report further observes "This riot took hundreds of lives and a large number of people also received bodily injuries of serious nature Thousands of houses including shops spread to about 250 villages lying in 15 blocks out of 21 blocks of the district"

The most fundamental question is who started the riots? What happened immediately preceding the eruption of communal violence? The report addresses itself to this question and examines all relevant evidence put before it Of course contradictory claims were made by the witnesses and the commission had to draw its own conclusions Violence erupted on October 24 afternoon when the Ramshilapujan procession reached the Muslim dominated Tartarpur area It is said that bombs were thrown on the procession from a Muslim school and then the communal rioting started

The Hindu activists claimed that the procession was completely unarmed and they were singing 'bhajans Also, there were old men women and children in the procession and therefore there was no question of the processionists starting the violence in a pre planned manner The Muslims on the other hand, maintained that no one threw bombs from the school It is a sheer fabrication Since it was contented by the organisers of the Shilapujan procession that the Muslims had kept their shops and schools closed as they were to start the violence the commission also examined all available evidence in this respect A large number of Hindus as well as Muslims appeared before the commission as witnesses

It must be said that many Hindu witnesses helped bring out the truth The organisers of the procession had claimed that the processionists were unarmed and only singing devotional songs But some of the Hindu witnesses present on the scene falsified this claim For example Anil Kumar stated before the commission that the processionists were shouting slogans Jai Ma Kali Tartarpur khali (long live Mother Kali, Tartarpur will be empty) and Apman ka badla lenge Babar ki santan se (we will avenge the insult inflicted by Babar from his children) Anil Kumar also narrated that there were members of VHP Bajrang Dal and RSS in the procession They were carrying weapons like swords lathis, spears and pharsans (a local sharp weapon) When the procession went from Aliganj to Shujaganj Anil Kumar witnessed the processionists looting the shops and the police helping them

Kapildev Mandal said before the commission that as students they had gathered near the gate of INJ College to see the procession Mandal too mentions that the processionists were shouting slogans like Jai Maa Kali Tartarpur karo khali and Apman ka badla lena hai Babar ki santanon se The organisers of the procession were BJP, VHP, Bajrang Dal and Vidhyarthi Parishad people and they participated in the procession

things to say. One Muslim witness pointed out that apart from other slogans the processionists were also shouting that today it is Ayodhya's turn, tomorrow it will be that of Kashi and Mathura. Another slogan being shouted was 'Bachcha bachcha Ram ka, baki sab haram ka' (every child is for Ram, the rest are illegitimate). Some Muslim witnesses maintained that there were no old men, women and children in the procession. The commission drew its conclusion on the basis of what was stated before it by various witnesses. The report states:

> The net result is that there is divergence of evidence on this point. After scrutinising the aforesaid evidence we are inclined to accept that by and large a large portion of the majority of the processionists were peaceful and totally devotional in their attitude and were dedicated to the religious task that they were performing but there were also persons who were armed and there were persons who shouted slogans. We derive sustenance for our view from the fact that apart from the Muslim witnesses a large number of Hindu witnesses also have supported this state of affairs. We must, however, make an observation. This provocative act of intolerance defiled the sanctity of a purely religious procession and also destroyed its peaceful character leading to devastating consequences.

The Commission further observes:

> When any place of worship is intended to be constructed to the Glory of God then creation of a political controversy and shouting of slogans should have been avoided because it was an act of sacrilege in relation to an act of extreme piety to Him whose temple was to be constructed.
>
> On the other hand the Muslim community also should not have been so sensitive and agitated. If the slogans would have been ignored and the Muslims had exercised forbearance and the procession allowed to pass through Tartarpur even if it hurt Muslims heaven would not have fallen but the concession so granted would have avoided the events that followed.

It is true politicians from both sides tried to draw maximum political mileage and traded in human misery but the BJP had made it a main political plank for its determined bid for power at the centre. It was its calculated strategy to mobilise Hindu votes by appealing to their religious sentiments.

Another important issue in the Bhagalpur riot was the throwing of bombs and other missiles on the procession. Many alleged that bombs and other missiles were thrown on the Ramshila puja procession from the Muslim school in Tartarpur and this triggered off the violent events. The commission examined various witnesses in this regard and drew its conclusion. Thus, the report states, "At the point when the procession was approaching the Parwati chowk the of it. This was around 2 p.m. The procession moved gradually towards the school, called the 'Muslim school' beyond which was the Tartarpur chowk. As soon as it reached the western gate of the school, it is alleged, bombs and brickbats were thrown from the school premises which, according to the S.P. did not cause any damage nor any injury to the processionist. The missiles were totally ineffective according to him. The district magistrate, acting with great speed declared curfew in the area and ordered the processionists to turn back." The truck carrying the consecrated Ramshila bricks was also sent back. Acting with speed all the entry points were sealed and the railway station was directed to stop the incoming trains to Bhagalpur.

According to the report, the deputy superintendent of police, Navin Kumar and Dubey the inspector, accompanied by a posse of constables chased the miscreants who were stated to have thrown bombs. The posse even entered the school through the side door but nobody could be found. The police party chased the miscreants up to the railway line but failed to apprehend anyone.

The police also chased the miscreants up to Gulab Manzil, a building owned by a Muslim. The police, on hearing the sound of groaning, entered the lodge and found two persons, Jaikant Yadav and Nawal Kishore Jha, severely assaulted and nearly killed by Muslims. Their statements were recorded in the kotwali' But regretfully these two persons have not appeared as witnesses in the inquiry commission report.

The commission mentions that it is not clear from the FIR from which part of the (school) building the bomb was thrown. In fact, according to the report the FIR does not clearly state that the bombs were thrown from the Muslim high school premises or compound. The report goes on to say, "It has been alleged that as soon as the bomb was thrown the police accompanied by inspector Dubey and Navin Kumar deputy superintendent of police entered the school from the side door. No miscreant was found or arrested and nothing incriminating was recovered from within the school premises."

The commission is not sure whether the bombs were thrown from the school, and if thrown whether they were at all thrown by the Muslims. It says, "There could have been miscreants who might be either Muslims or Hindus or both. The total analysis of the evidence certainly creates an aura of doubt over the whole episode notwithstanding the real evidence. It may be that some miscreants of doubtful communal hue may have thrown bombs, some stones and crackers to create a mayhem but nothing more can be said." Also, the report draws our attention to the fact that the administration has no list of those injured by bombs. Thus, the hypothesis bombs from the Muslim school is of doubtful value. The commission also concludes, "In the ultimate analysis we feel that the first bombing from the Muslim school appears to be doubtful, except that some miscreants may have thrown some missiles and crackers from somewhere in the vicinity to create a mayhem as stated above."

The commission blames the BJP for having played active role in the riots. The BJP, RSS always maintain that they never participate in any riot. But many riot inquiries have confirmed their involvement, be it Madan Commission Report on Bhiwandi riots or Justice Jagmohan Reddy Report on Ahmedabad riot of 1969. The Bhagalpur Riot Inquiry Commission Report also pulls up BJP for its role. The report comments: 'Exhibit A also highlights the fact that it was BJP workers who indulged in the act of loot and arson and armed home guard jawans after abandoning the ASI. The occurrence was quite widespread.'

The report relates that the Muslims alleged violent mob of Hindus attacking the Sujaganj market where houses and shops of Muslims were ransacked and set on fire. According to the Muslims the whole thing was so meticulously planned that in a building that belonged to a Hindu but was tenanted by a Muslim only the shop was looted. The building was not set on fire. On the other hand, a shop belonging to a Muslim with a Hindu tenant was looted and the building was set on fire. Simultaneously mohalla adjacent to the Parwatti mohallah was also attacked. Houses were burnt, property looted and a large number of people were done to death. This occurred around 12 noon i.e. both these occurrences took place prior to the alleged bombing from the Muslim school. Thus, the thesis of bombs hurled from the Muslim school triggering the communal violence falls flat.

Administrative Negligence

The commission has passed strong strictures against the district administration for its handling of the situation. The police behaviour was completely partisan. The commission report remarks: 'The events that followed indicated the utterly irresponsible behaviour of the district administration, particularly the kotwali police led by the officer in-charge of the kotwali thana. The sub-inspector of the Tartarpur thana accompanied by a large force of police officials embarked upon a massive search of the houses of Muslim residents of Tartarpur mohalla ostensibly on the basis of the FIR lodged by the inspector, kotwali in P.S. Case No. 673 but in reality to avenge the alleged rainfall of bombs on the S.P. and in ostentatious bias against the Muslims. *The manner in which the search was conducted was reminiscent of the searches in occupied*

pared even though the cause of action for such searches in most of the cases was revengeful Highly responsible and respectable members of Muslim community who were neither involved in political nor in any ideological or religious fanaticism were subjected to the search and *fascist method of assault and torture was resorted to* We would like to cite three individuals namely Wasimul Haque Kalimur Rahman (Sahebganj) who had a clinic at Tartarpur and G Mustafa Bhagalpur University who were severely assaulted humiliated and maltreated and imprisoned They were intellectuals who enjoyed status of respectability in Bhagalpur society They like many others expected the police to extend their protection to them but were thoroughly disillusioned when their protectors became their destroyers Other Muslim residents large number of whom were also highly respectable, and not involved in any crime whatsoever were subjected to similar maltreatment (emphasis added)

The commission points out that the police behaviour was so partial that it did not arrest any Hindu on the day of the riot There is nothing on the record the commission points out to indicate whether any Hindu was arrested that day or between 24th night and 25th morning although at least inspector Dubey had admittedly seen the sack of Muslim business premises in Shujaganj and had also been informed about the attack arson loot and massacre in Parwatti chowk It may also be interesting to state here that no FIR was lodged either with regard to Shujaganj or Parwatti chowk incidents although a large number of FIRs were lodged by the police until 2nd FIR 674/89 was lodged by Brij Kishore about the incidents of Shujaganj in kotwali thana and by Sami Alam with regard to the incidents of Parwatti

Rumours and Reality

Another factor which contributed to the aggravation of communal violence was the rumour that large number of Hindu students living in nearby lodges or coming from examination halls were massacred by Muslims in and around Tartarpur This rumour spread throughout Bhagalpur and nearby villages like a wild fire and Hindu mobs set out to seek revenge It was rumoured that these Hindu students were killed and thrown into wells The commission felt that the district administration took no steps to squash these rumours and let them spread Thus, the commission observes, 'A rumour was sent floating through Bhagalpur's communally charged atmosphere that thousands of students have been massacred in various residential lodges owned by Muslims, on October 24, 1989 and immediately thereafter The district administration in utter display of administrative incapacity and propaganda allowed the rumours to float like a fog that covered the entire city and the villages of Bhagalpur district without making any attempt to scotch it even if it was true to prevent its fall out"

On thorough inquiry after about a fortnight (when all the damage was done) it was discovered that only 22 students were missing 11 of whom were Muslims and 11 were Hindus out of which, it was finally discovered that only two Muslim students had not reached their homes and were perhaps killed The commission observed that Ramanujan, who ordered inquiry into these rumours, failed to take any adequate steps in scotching this rumour to prevent the catastrophe that occurred The inquiry therefore, having taken up a couple of days was of no practical value in the context of highly tense situation prevailing in Bhagalpur and surrounding areas

It has often been seen in various communal riots that the police has close connection with the communal elements and is even guided by their opinions and acts in collusion with them Bhagalpur was no exception to this The report comments 'The significance of this unholy alliance between the police and the BJP was tragically devastating and it not only boosted the morale of the communal elements in the execution of the diabolical designs but also conveyed to them the message that *they have not only the support of the police but its active participation in their activities* (emphasis added)

There was another devastating rumour doing the rounds of Bhagalpur city that some Hindu students after being massacred by Muslims have been thrown in the well of the Sanskrit College under the kotwali thana Nothing was done to defuse these rumours and it was only when a news item appeared on November 1, 1989 that the well was searched and dead bodies were recovered belonging to men and women and children of Muslims that the truth was known to the people In fact such rumours are deliberately spread in a systematic manner by the vested interests in order to fan the communal fire And often, as in Bhagalpur the district administration takes no steps to counter these rumours as it has sympathies with the communal elements

In view of all this the Bhagalpur Inquiry Commission Report compares this communal massacre even with the massacre in Kalinga The report says,' the wholesale massacre of the innocents [in Bhagalpur], quite reminiscent of Kalinga by Ashok in ancient times, the sack of Delhi by Nadir Shah in the medieval period and the communal butchery that led to the end of Mahatma Gandhi's life in post independence era The tragedy was further compounded by the fact that those who were required to extend their protection abondoned their sense of duty became a part of the massacring and looting masses and even leading at some places"

It is well known that the rioting was not limited to Bhagalpur city alone but had spread to number of adjoining villages In villages also, the policemen were leading the mobs in attacking Muslims The report throws light on an incident in which an assistant inspector of police was leading the attack The report says that on October 27, 1989 at about 7 a m the village, Lugain, was attacked by about 4,000 Hindus from surrounding villages of Hemra Amhara, Mirnagar and eight others Some of the eyewitnesses to the occurrence alleged that the ASI of the police attached to Jagdishpur police station namely, Ram Chandra Singh personally directed the attack saying that no Muslim should be allowed to escape This attack went for nine hours

The report throwing further light on the incident says that some of the Muslims escaped and hid in the nearby paddy fields When darkness set in they fled away to the nearby Babura village Nearly 200 persons were killed and their bodies were first thrown in the pond Later they were dumped into two wells of the Muslim tola An effort was made to fill up the wells with mud but the stench of human bodies still exuded Hence the bodies were taken out of the two wells and surreptitiously buried in long rows in three paddy fields Cauliflowers were grown over one of them All this is believed to have been done under the direct supervision of the ASI Ram Chandra Singh of Jagdishpur thana

This is no ordinary indictment of the forces of law and order by a commission comprising high court judges These remarks are enough to hang our heads in shame that in a democratic and secular India such things could happen

The Bhagalpur riot inquiry report has been submitted after the lapse of five years The public memory being proverbially short, much of the events have already been forgotten. One can even wonder what purpose the report will serve now All riot reports are unfortunately submitted after a long time The Bombay riot inquiry even after three years since the violence broke, has not been completed The preparation of final report may also take a long time But these reports are legal documents and they enable us, albeit late, to know the truth The idea of submitting these reports is not to revive the memory of these riots and thus keep the cauldron boiling but to understand what happened and why and who was responsible so that we may avoid such violence in future Communal hatred and bloodshed has led us nowhere it has only brought disgrace to the fair name of our country The only lesson,' therefore, to be drawn is to avoid such bloodshed in future and promote secular and democratic forces No modern nation state can survive without it

Agricultural Situation on Eve of Monsoon

Joginder Singh
Ashok Bannerjee

With the forecast of another normal monsoon, the eighth successive one, and food demand continuing to be constrained by mass poverty the government's preoccupation on the eve of the monsoon is dealing with problems of 'plenty'

THE forecast for the 1995 monsoon, so eagerly awaited by the government and farmers was released by the Indian Meteorological Department (IMD) on May 25 According to the IMD s rainfall model another normal monsoon, the eighth consecutive one it that could be expected

In meteorological terms a normal monsoon means that there could be a deviation of only 10 per cent from the long term average of 88 cm for the country It was also predicted that unlike last year the rainfall this year would be slightly below the normal by about 3 per cent which would make it about 13 per cent less than last year s precipitation

The south west monsoon commenced over Kerala on June 1 this being the normal date of its arrival The rains rapidly advanced over Karnataka and parts of Tamil Nadu and Andhra Pradesh During 1994 the monsoon had set in over Kerala earlier on May 28, and the initial performance seemed to justify the predictions

Thereafter the monsoon unfortunately weakened This gave rise to a lot of anxiety for a time as to whether the requisite rainfall for the Kharif crops would be had It was feared that there was some damage to crops in Karnataka and Maharashtra This even led to dampening of the regional stock markets and firming up of grain prices in the commodity markets Later developments have been heartening as the monsoon has rapidly spread into the eastern and north western parts of the country pre-monsoon showers giving rise to hopes that kharif crops arriving in October November would be as in previous years

As of now it is too early to take a definite view on the matter A good rainfall year would further the production of foodgrains and this will now be considered

Following the expectation of normal rainfall and better availability of inputs, total foodgrain production is expected to be around 189 190 million tonnes in 1995-96, against the production of 186 million tonnes in 1994 95 The Planning Commission has projected production in 1995 96 at 192 million tonnes The cozy situation of rice and wheat is however not shared by pulses

On June 26 the government slashed the import duty on pulses by 50 per cent This meant a reduction of duty from 10 per cent to 5 per cent This was done to encourage the import of pulses so as to ease the price situation by increasing availability in the domestic market there being a gap of 3 million tonnes between demand and supply It was felt that import of one million tonnes of pulses had to be effected urgently for which NAFED and STC have been deputed A comparison of the domestic and international prices reveals that international prices are lower for arhar by 36 54 per cent for moong by 16 96 per cent and for urad by 18 76 per cent

Market arrivals as well as procurement of wheat until May 10 were lower by 21 per cent than a year ago in the same period Procurement was affected initially by diesel shortages particularly in Punjab and Haryana delaying market arrivals by about half a month The situation has however begun picking up and wheat procurement by the close of May had reached 10 92 million tonnes arrivals having been 11 11 million tonnes This is lower by only 18 lakh tonnes than the figure in the corresponding period last year

The government has set a procurement target of 13 million tonnes of wheat this season is against 11 95 million tonnes procured last year Wheat procurement in 1995 96 is expected to cross the previous year s figure but is expected to be below the target set for the year As a result of continued procurement, total foodgrain stocks in the central pool on May 15 was 26 14 million tonnes, slightly more than last year s level Stocks on July 1 are expected to be around 36 million tonnes - far in excess of the buffer stock norm of 22 3 million tonnes

on food had recommended a staggered procurement system with a gradual increase of the support price as the season progresses Since procurement will inflate foodgrain stock further, India is well placed to export and this aspect will be considered next

The world rice trade during 1995-96 is expected to touch 16 5 million tonnes, from 14 million tonnes in 1994 95 India according to the United Nations' *Food Outlook* report, is likely to increase its share in the world market this year to 1 4 million tonnes from the last year's figure of 6 lakh tonnes This increase would be possible because of a bumper rice crop and large accumulated stocks as well as increased demand from several countries

China last year's fourth largest exporter is likely to become the world's largest importer of rice in 1995 owing to a drop in its rice production Whether it would continue to import large quantities of rice would depend on the early rice crop still on the ground

Pakistan s exports are likely to come down due to poor output last year Indonesia is expected to import one million tonnes this year while Nepal is also expected to effect imports the output of rice showing a 15 per cent drop in 1994 According to reports Bangladesh, faced with high rice prices, is also contemplating import of rice North Korea, faced with a serious rice crisis had recently requested the Japanese for rice South Korea sent rice to their northern brethren in un marked bags and it is expected that substantial imports would be made by this country

The big question is whether India will be able to take advantage of this enhanced overseas demand The government has estimated rice export of around 2 86 lakh tonnes, valued at Rs 218 crore in 1994-95 against actuals of 1 95 lakh tonnes valued at Rs 140 crore in 1993-94 This indicates that exports from India have not been much, despite the country having bumper crops for the past many years

This is probably due to operational problems faced by the traders, who are not allowed by FCI to change lots FCI moreover gives preference to PSUs, some of whom are even alleged to collect a commission of 2 per cent for acting on behalf of private exporters in the open market sales scheme Furthermore, private exporters have to bear the brunt of shortages during transit There are also problems in obtaining wagons for the transit of cargo from warehouses to ports At Kandla the congestion frequently leads to delays and demurrages

The Food Corporation of India (FCI) has been authorised by the government to export 20 lakh tonnes of rice at international market prices with no subsidy element

In response to the above, the FCI has secured export orders for the supply of 7 lakh tonnes of rice to various parties It was realised that there were better prospects for exporting rice than wheat since rice prices were more competitive It was also realised that the stock of rice in FCI's godowns were not up to international requirements, the percentage of brokens being more Accordingly FCI preferred that other agencies do the exporting after having upgraded the rice

FCI is attempting to gear up for the export effort by moving the maximum quantity of best quality rice from Punjab straight to Kandla port for loading the ships dovetailing this movement into its regular monthly grain movement plan

The Lok Sabha standing committee on food, civil supplies and public distribution in its report has stated that the government should come out with incentives to stimulate the production and export of hard wheat, as most Indian wheat is soft i e non durum chappati variety which is considered inferior in the international markets Indian wheat has a gluten content of about 10 11 per cent as against international standards of 12 13 per cent Accordingly, the export prospects of Indian wheat are not favourable, Indian wheat being quoted at $ 100 a tonne as against hard wheat prices of $ 160 180 a tonne in the world market

Faced with mounting stocks, the government has authorised FCI to undertake wheat exports up to 25 lakh tonnes in 1995 96 at prices ruling in international markets and without any subsidy element FCI has also been authorised to sell 50,000 tonnes of wheat to STC for exporting to other countries Last year FCI had been allowed to export durum wheat up to 3 million tonnes from the open market subject to a minimum export price (MEP) of $ 160 per tonne, but this stipulation was removed in September last year

Indigenous production of nitrogenous and phosphate fertilisers was at an all-time high in 1994-95, viz, 141 43 lakh tonnes of urea and 28 23 lakh of di-ammonium phosphate (DAP) due to high capacity utilisation by practically all units Even with the prospect of an increase in indigenous production in 1995-96, import of about 3 million tonnes of urea and 6 lakh tonnes of DAP will have to be arranged for With larger sales and higher average price of imports the subsidies bill is likely to exceed the budget estimates by over Rs 1,000 crore in 1995-96

With the dark days of 1991 well behind, the nation's granaries are already overflowing With a good monsoon being predicted, the problem today is not one of shortage but of excess This is a peculiar situation which seems to have caught the government on the wrong foot With the monsoon arriving, the government has started preparations for stockpiling of this year's foodgrains The nation already had a huge stock of 36 million tonnes with the rabi procurement season coming to an end To meet this situation the government, though belatedly, is initiating certain measures

To begin with the government, in order to augment storage capacity, has amended the 1995-96 budget proposals to reduce the import duty on agricultural silos from 50 per cent to 25 per cent Thereby the government hopes to ensure the proper storage of foodgrains and reduce losses

The government has also decided to adopt a wait and-see attitude to procurement The parliamentary standing committee on food had recommended a staggered procurement system with a gradual increase of the support price as the season progresses The government has also attempted to improve the quality of procurement by stepping up the quality restrictions – broken rice would now be permitted to the extent of 20 per cent (instead of 30 per cent as before) This will raise the quality to international standards somewhat

Faced with the stagnation of foodgrains offtake under the public distribution system (PDS), the government is concentrating on the revamped public distribution system (RPDS) which has a higher offtake

The huge stock of foodgrains costs the exchequer heavily to maintain and the government is attempting exports on a large scale For this purpose the FCI has been roped in to augment the efforts by STC and MMTC

Although a number of steps have been initiated to meet the situation, these have not been comprehensive and much remains to be done Despite the government's attitude of taking complete control of the sugar, fertiliser and cotton sectors, it would perhaps be best if these were allowed to respond freely to the economic conditions to be able to face the globalisation trend

Journey through America's Backyard

Raghu Krishnan

What strike the traveller in Nicaragua is not only the poverty of the people which in truth has yet to reach 'Indian proportions' – but also the chaos and sense of social paralysis And Nicaragua is a country which is so very American in the proper sense of the term

RECENTLY returned to Mexico City from a two week trip overland from Managua Nicaragua It was more than tourism since I had been involved in solidarity efforts with the Nicaraguan Revolution and Salvadoran rebel movement in the late 1980s In retrospect I can see how the 1990 Sandinista electoral defeat in Nicaragua and the failure of the FMLN insurrection in El Salvador in late 1989 were personal defeats of a sort And it is safe to say that I was not alone in this feeling

For their part the men in power in Washington and other imperial capitals elated by the defeat of the revolutionary movement in these two countries drunk with their cold war victory and distracted by the economic mess they have created at home have conveniently forgotten the peoples of Central America For my part I went in the hopes of discovering what is and what might have been But as the days went by it became clear that I had not prepared myself adequately for the trip

It is not that poverty is something new for me I have been through India on a number of occasions and actually lived there for several months in recent years What strikes you in Nicaragua is not only the poverty of the people you see which is truth has yet to reach Indian proportions but also the sense of chaos and social paralysis Some 60 per cent of the active population is said to be unemployed Destroyed by the earthquake of 1972, Managua still does not really exist as a city we would recognise as such No downtown and garbage laden and weed filled empty fields and mini Bombay esque slums border what few buildings you may find Every social category from the smallest of children to the oldest and most fragile of men and women try to scrape out a living selling whatever they can from snacks to small consumer items There has been no let up in the rise of cholera cases in the country Everyday the papers are filled with grizzly and heart wrenching stories of suicides road accidents crimes of passion involving teenagers and murder And it is said that the situation is much worse in rural areas where the poor don't even have the luxury of others bearing witness to and sharing their misery Suffice it to say that this is not the land of milk and honey the US backed candidates promised would follow the defeat of the Sandinistas in the 1990 elections

And in truth this was not the Nicaragua I had imagined However much I knew about America's misdeeds in its backyard (at home and around the globe) I was simply shocked by how such a situation could exist so close to the US the wealthiest country in the history of human civilisation Look at your map and you will see that after all we in Canada are not so very far away either As the crow flies Managua is nearly as close to Toronto is it is to Los Angeles

And it is a country which is so very American in the proper sense of the term a product of European colonisation genocide destruction immigration, innovation inter mingling and anti colonial rejuvenation in the New World One sees white people various shades of brown tell tale Amerindian cheeks and eyes a few Blacks from the Atlantic Coast and everything in between And so very American in the more modern commercial sense of the term Take baseball for example To denounce Cuba in manoeuvres in Nicaragua the very right wing Oliver North once used satellite photos of baseball diamonds as proof declaring Nicaraguans don't play baseball Cubans do Yet baseball the American pastime is everywhere in Nicaragua from the Nicaraguan league playoffs that filled the papers and TV screens during my visit to the kids playing with a stick and the pit of an avocado in the street

What fate I wondered awaited those less American benighted and distant peoples of Asia and Africa?

Leon west from Managua towards the Honduran border is a traditional centre of radicalism in Nicaragua and remains a Sandinista stronghold Leon is a real city that preserves a Spanish colonial feel grand cathedral plaza and all It is bedecked with radical murals and graffiti and in spite of the crisis returns a sense of community cordiality and hope which I was able to sense in my meanderings and in conversations with people

This unfortunately didn't save me from an unpleasant dinner conversation with two students one from Granada, the other from Managua both decidedly unhappy with their radical student surroundings They told me that things were better under Somoza, and that the wily Sandinistas had managed to convince foreign opinion that they were the victims when in fact the very opposite was true One of the two had studied in Spain and spoke admiringly of the achievements of Franco and his regime If nothing else, I would be able to leave Nicaragua free of any romantic and ultimately illusions about how Nicaraguans were a race of idealists and revolutionaries

So there is disbelief that such a situation of poverty and insecurity could exist so close to the US But further on, there is anger that this same country did everything it could to prop up the hated Somoza dictatorship until its dying days in 1979 and to strangle this humble people's attempts to make something better of their country

The Gallery of Heroes and Martyrs in Leon is a reminder of the terrible human cost of US policy towards Nicaragua Photo after photo of young men and women who died often tortured to death in the fight against the US backed dictatorship, and afterwards in the US sponsored Contra war The elderly woman who tours you around the place herself lost two sons In keeping with these unhappy times the place in which the gallery is housed is currently the object of a property dispute with the former pro Somoza family that had mortgaged the house and fled the country before the Revolution now demanding its return

Invited by dockworker trade unionists, I went to the port city of Corinto on the Pacific coast This was the port Ronald Reagan mined in 1981 and then attacked with submarines in 1984 blowing up a few oil storage tanks in the process That such a sleepy dusty and hot oven of a town should be the object of manoeuvres by the US fleet says a lot about the cowardice and heaven help us all the madness, of the architects of the New World Order

It seemed all the more foolish because Corinto is no traditional boiling cauldron of radicalism As things go in a small impoverished nation, portworkers are a privileged lot and were treated relatively well under the Somoza regime I met some older ones who even said things were better then than under the Sandinistas to the rolled eyes of other more politicised and younger dockers In a way things were better under Somoza for dockers no American blockade, no war ongoing government efforts to nurture the allegiance of a privileged layer of the working class and the global economic crisis had not yet fully hit I was told that there was very little support for the Revolution in Corinto until 1978, when Somoza had his soldiers carry out 'Operacion Limpieza (Operation Clean-Up), in which, in a desperate bid to stem the revolutionary tide in the country every able-bodied young man was hunted down and killed This created widespread revulsion in the town, and sent those youth that could get away in flight to the protection of radical centres like Leon There's not much happening at the port these days given the economic crisis The workers' salaries have been frozen since the Sandinistas were defeated in 1990 On average a docker, still relatively privileged, makes about 1,000 cordobas, or about 150 US dollars every month I was told that

prostitution is bigger than it was under the Sandinistas, who had put programmes in place to help the young women in question find other lines of work

One gets to the highway to Tegucigalpa, Honduras after taking a series of packed and somewhat perilous buses through the hilly areas of Nicaragua surrounding Esteli The buses are often just yellow school buses from the US and Canada often with their markings and signs untouched I took one that had bilingual signs inside in English and French!

The thing that struck me most about Tegucigalpa was the strong Chinese presence I stayed at the Hotel Nankin' and ate a few plates of Chinese food at some of the dozens of Chinese restaurants sprinkled throughout the city Even the non Chinese places serve Chinese food or some facsimile thereof It warmed my Asian heart The city itself is pleasant enough surrounding as many in the region seem to be by hills and mountains Here as in Nicaragua and El Salvador a major social and political struggle is centred around the planned privatisation of the state owned telephone company which would undoubtedly lead to mass dismissals higher rates further concentration of wealth and power and a loss of sovereignty in the key telecommunications field

I happened to be in Tegucigalpa on the day that telephone workers went on strike for the first time in Honduran history a newspaper reported to my surprise and pass by their occupation of the Hondutel main office in the city's downtown When I went by another branch the following morning the workers had been ejected and a few bored but amply armed soldiers stood outside the entrance

The bus from Tegucigalpa to San Salvador El Salvador takes you through the area that was one of the main zones of conflict during the recently ended war between the FMLN rebels and the US backed government There are signs of construction on empty lots for wartime refugees returning to the area but the general feeling is one of terrible poverty and decrepitude amidst beautiful scenery a scene repeated in far too many parts of the third world Anyone familiar with the landscape and recent history of Sri Lanka for example would feel at home in El Salvador

If poverty at all has a humorous side, it is to be found in the music that you get to hear on buses going through Central America especially outside the major cities It seems that my K-Tel 'Pure Gold' LP from the mid-1970s, and a number of other people's 8 track cassettes did not meet such an unhappy end after all

When you leave the airport just north of Colombo, Sri Lanka, you enter the Katunayake free-trade zone (on the Canada Friendship Road!) crammed with export-oriented factories and workshops employing throngs of nimble-fingered young women from rural areas, slogging away for a pittance and without labour rights. And so it goes on, the approach to San Salvador where you can see the young women in the San Marcos Zona Franca who make about 100 US dollars per month in terrible conditions, and are forbidden to join unions San Salvador, the city itself definitely takes the 1995 award for black smoke and impossibly pointless horn-blowing It is a city that at times but only briefly and inconclusively made me rethink my longtime love for urban squalor and chaos

Further horrors awaited After a few minutes' ride on one of the city's murderous buses you find yourself in downtown Mississauga on a wide boulevard (Boulevard de los Heroes) surrounded by McDonalds, Burger King, Wendy's Pizza Hut Texaco, Esso and a miniature version of Square One called Metrocentro On the same strip is a super arcade (with video games, bumper cars fair rides and so on) called El Mundo Feliz, the Happy World Standing there basking in the glow of El Mundo Feliz's Honest Ed style flashing lights gazing across at the Burger King I meditated upon the years of brutal state sponsored violence torture and grinding poverty upon which this concentration of wealth stood I was told that even at the height of the war and killings by recently reactivated death squads the area was much as it is now

It was hard to believe that I was in the same country although when you see the figures on El Salvador's not insignificant wealth and the way it is distributed it all makes sense How such extremes could co exist at such close quarters also becomes apparent when you see the dozens of heavily armed security guards stationed at the entrance of every possible place of business and the truckloads of police doing their rounds of the neighbourhood After being in the city for awhile, you get used to a constant fear of violence I learned for example, that one night a few months before the place I was staying had been stormed by heavily-armed bandits Armed hold ups on public buses are a regular occurrence I waxed quite indignant on one occasion when, for the first time in my life, I got special attention from one of the Mexican immigration inspectors that boarded the bus on about 10 different occasions during the bus journey from the Guatemalan border to Mexico City

At the first inspection about a dozen undocumented aliens all young Central American men were removed from the bus, presumably to be expelled back to Guatemala and points beyond Another suspicion confirmed the more borders open up for capital and goods, the tighter they close to human beings especially where the free trade is between a 'first world' and a 'third world nation

At a later checkpoint, after performing the usual passport check and questioning, one smiling inspector asked me if I was a Hindu Yes, my parents are from India, I replied Oh I see he said it's just that everyone in the department seems to be very afraid of Hindus these days' But then I replied we are an innocent people And this Hindoo to paraphrase a poem I once read couldn't hurt a fly

Mississauga is a residential and commercial suburb of Metropolitan Toronto and has seen spectacular growth over the last 10 15 years Malton is a part of Mississauga and has a sizeable south Asian community

Essays in Indian History

Towards a Marxist Perception

by IRFAN HABIB

This volume brings together, for the first time, essays by Professor Irfan Habib (Centre for Advanced Study in History, Aligarh Muslim University), published in various academic journals over a span of some thirty years What gives the collection unity is the author's effort to interpret the main currents in Indian history from a standpoint that belongs to the Marxist tradition of historiography

Contents Problems of Marxist Historiography • Marx's Perception of India • Social Distribution of Landed Property in Pre-British India • Peasant in Indian History • Caste in Indian History • Potentialities of Capitalistic Development in the Economy of Mughal India • Forms of Class Struggle in Mughal India • Processes of Accumulation in Pre-Colonial and Colonial India • Colonialization of the Indian Economy • Studying a Colonial Economy without Perceiving Colonialism

400 pages *Hb* *Rs 450*

A Fuller View of the Emergency

Balraj Puri

As the Congress(I), the perpetrator of the Emergency, appears to be heading for its final end and as the victims of the Emergency are in ascendance, this is an occasion for going beyond condemnation and instead attempt a more dispassionate understanding of the phenomenon and its place in the evolution of the Indian polity

THE infamous Emergency is being recalled, two decades after its promulgation, with well deserved universal condemnation There is hardly a dissenting voice to justify it As the Congress(I), the perpetrator of the Emergency, appears to be heading towards its final end and as the victims of the Emergency are in ascendance, it should rather be an occasion for going beyond condemnation The distance of time should further be used to attempt a more dispas sionate understanding of the phenomenon

I belonged to the camp led by Jayaprakash Narayan when national politics was polarised between him and Indira Gandhi I cherish my life-long close association with the great man and the amount of affection he showered on me But I was not his uncritical admirer He respected me all the more for this reason

With these credentials I attempt below an objective assessment of the contribution of the two main characters to the collapse of the system in 1975

First, I recapitulate the traits of Indira Gandhi's insecure personality that made her seek security in an authoritarian set up Second, I would show how anarchist streaks in JP's philosophy led him to join his adversary in wrecking the system

'It was a proposal regarding committing suicide that we were just discussing" with these words, or in almost so many words Indira Gandhi prefaced, with a grin on her face, the announcement to hold general elections to parliament, before an assembly of chief ministers in the evening of January 18, 1977, after stepping out of a cabinet meeting which heard and approved the fateful decision in a manner to which it had by now been well used The chief ministers, who were in the capital to attend one of their periodic conferences had been invited to the prime minister's house to be the first to formally hear the cabinet decision

Evidently she was pretending to be humorous And the chief ministers too, did not read anything more than what met their eyes then But was it a Freudian slip, indicating her sub conscious sense of insecurity and fear?

Psychological Make Up

"What has happened is not surprising' Indira Gandhi said with a hindsight She was always warning about agencies, she told the post election session of the All India Congress Committee held in New Delhi on May 5 6, 1977 which would not let us function and would weaken if not destroy Congress She added fatalistically it was perhaps inevitable that they would succeed" [1]

Indeed she has warned times without number, before during and after the Emergency against internal and external threats to the stability, unity and very survival of the nation as also to her own life

In the Congress session held at Chandigarh in January 1976 where the party president Dev Kant Baroo ah summed up the ideology of his party as loyalty to Indira Gandhi , amidst deafening cheers, she gave vent to her sense of loneliness In her address, hitting hard all around she accused her colleagues of having remained silent spectators when she was being attacked and her character was being assassinated by the opposition She asserted that she had met the challenge alone and would do so in future also

Referring to her cabinet colleagues she said way back in 1972, in a press interview, what do you expect me to do? I am surrounded by a bunch of idiots' [2] Sasthi Brata finds three traits in this remark 'The first is frantic impatience with the frailties of other mortals born of a pathological conviction in something approaching one s own divinity The second is culpable contempt of one s countrymen And the third is an ominous pointer to the kind of actions such a personality might take if ever it was thwarted in any field by those it considered infinitely inferior [3]

Similar traits of her personality were manifested soon after being elected prime minister in 1966 Expressing her impatience and contempt for persons and institutions she had to work with, she said "Our party workers remain as backward and ignorant as ever The trouble is that Congress has never succeeded in evolving into a modern party Sometimes, I feel that our parliamentary system is moribund Everything is debated and debated and nothing gets done " [4]

Rise of Mediocrity

Such a person cannot suffer an institution where he or she has to face an equal or superior nor would an equal or superior person would be tolerated ' Soon after 1967, she became suspicious of people who had a standing in public life," [5] Janata Party president Chandra Shekhar observed

Men and women around Indira Gandhi, in the words of Janardhan Thakur, 'constituted so much mediocrity so much grossness and insignificance of character that would have been hard to find even in the minor courts of the Italian Renaissance ' According to M O Mathai special assistant to her father, unscrupulous, crude and small men and an immature boy took charge of her [6]

Are the fascist traits? According to Thakur, Feroze Gandhi called Indira Gandhi a fascist in 1959 when she was Congress president [7] Describing symptoms of fascism, Arun Shourie writes A regime of this sort filters a particular brand of persons to the top – mediocre weak men strutting around as strong quick to make deals with any adventurer, cynical devoid of all principles ' Quite apart from the filtering process of the regime s structure, he continues, the personal security of the usurper(dictator) re quires that only such persons reach the top [10]

That the psychological traits of her adult and public life discussed above had early beginnings is admitted by Indira Gandhi herself She says My own childhood was an abnormal one full of loneliness and insecurity [11] Her father Jawaharlal Nehru had in a letter to Vijayalakshmi Pandit dated June 2 1934 further remarked Indu revolves round herself self centred she hardly thinks of others – expecting everybody to minister to her comforts [12]

Authoritarian Personality?

At the same time having inherited the leadership from her father and grandfather she had convinced herself that she was destined to play a great role She in fact succeeded in creating the impression that she wanted to perpetuate a dynastic rule even after her Quite honestly' she believed in 1966, I was the only natural choice for the job [13] Since childhood she had fancied herself as Joan of Arc She is once reported to have said that she would like to go down in history as a strong personality, somewhat like Napolean or Hitler because they would always be remembered' [14]

In order to live up to the ambitious role she had aspired for she had to project the image of a brave leader Fear and Indira Gandhi do not go together , she told pressmen in Srinagar in October 1977 But if she was really fearless she need not have always tried to seek abnormal powers and safeguards, much more than required in a given situation When, for instance, her law minister H R Gokhale told her that he had ensured, through necessary legal and constitutional changes 99 per cent chances of getting the high court decision on her election reversed in the Supreme Court, she is reported to have insisted "make it cent per cent"

"She must be afraid, she does so many things out of fear"[15] was also the verdict of Jayaprakash Narayan However, a burning passion to be on top and urge for perfect security tended to make her a reckless gambler Mathai claims to have once told her father that having had no security right from childhood, "insecurity will shadow all her life and her actions will largely be governed by it" [16]

Does an ambitious person, who is basically lonely, insecure, suspicious self-centred and reckless answer the description of an "authoritarian personality"?[17]

While it is possible to explain much of the political behaviour of Indira Gandhi and its impact on political developments in the country in terms of her psychological make-up, an attempt to explain the entire phenomenon called the Emergency in terms of the role of a single person would also tantamount to a belief in a sort of 'personality cult' in reverse Psychology of a leader may be a necessary but in no case a sufficient, condition for his or her becoming a dictator

Anatomy of Authoritarianism

An authoritarian regime comes into being not merely due to psychological compulsions of the ruler but also in response to the psychological needs of the ruled When fear of external threat or internal chaos grips a people insecurity caused by economic or political factors haunts them gap between expectations and achievements widens and the democratic forces fail to channel the resultant frustration, cynicism and impatience of the people, and chauvinistic fervour atomises group and individual identities, a psychological atmosphere is created for the search of a 'strong leader' When democratic institutions prove inadequate to represent and express the power urge of the people – one of the basic and legitimate human urges – their accumulated urge gets identified with the supreme power of the leader

Also, 'people have a latent desire towards dependence and want the comfort of irresponsibility", says Einstein while discussing the causes of the origin of fascism which 'depends on the desire of many persons to submit and obey'[18] A D Gorwala "almost begins to suspect quite a number of Indians are not averse to tyranny and do not even feel very strongly about its worst excesses "[19]

While sadist-masochist psychology of the ruler and the ruled that drives them towards authoritarianism is difficult to read and measure, political, economic and social factors that create such a psychology and an authoritarian atmosphere can be objectively identified It is important to remember in this context that it was not an effective and efficient democracy that was demolished on June 26, 1975, it was an ailing system that collapsed on that day

The following description of the national scene in the year preceding the Emergency might not be off the mark. "Almost every aspect of the system is afflicted The value of money is vanishing with accelerating speed. Unemployment, scarcities and disparities are mounting in direct proportion to the explosion of expectations and promises of 'garibi hatao' The crisis in investment, production and distribution mocks at our professions of planning and socialism The political system is unable to contain or provide an adequate outlet to the popular discontent Votes do not accurately measure public opinion while legislative seats are not proportional to the votes polled by the parties Popularity alone does not enable a politician to share or get power Practically the whole society is corrupt No political leader can win an election or survive politically without resorting to corrupt means No businessman can remain in business unless he evades taxes and greases the palms of administrators for getting permits licences, allotments and thousand and one facilities from the government No government official can make both ends meet and live up to the standard his colleagues are maintaining without accepting gratifications

Apart from the state of economy recorded in official documents political situation reflected in legislatures and morality preached from the state, we have a parallel economy a parallel politics and a parallel morality "[20]

We have noted that Indira Gandhi had herself expressed dissatisfaction with the system Apart from blaming the 'backward and ignorant' workers of her party and the moribund' parliamentary system she said on top of all this the inertia of our civil servants is incredible Sometimes I wish we had a real revolution, like France or Russia, at the time of independence "[21]

Attack on the System

Talk of changing the system started in the ruling party itself A Congress MP, Shashi Bhushan, openly made out a case for a limited dictatorship' The then Congress president D K Barooah, thought "it irrelevant to look for foreign models to describe, justify or defend Indian democracy" The habit of being guided by foreign models, he said, often leads people to describe the absence of a viable opposition as a weakness of Indian democracy

The ideologues of the regime propounded alternative concepts of democracy and rationalised the decision to scrap the system, which was working till June 25, 1975, in the name of people and democracy D V Urs vice-chancellor of the University of Mysore, expressed the following view

"Times without number we quote the founders of English democracy, French and what not This has led to the creation of a universe of discourse which not even 3 per cent of our population understands The multitude, the bulk of the society lead a life that is delinked from the ruling thought of the country "[23]

'The national objective of socialism", observed K L Shrimali, then vice-chancellor of Banaras Hindu University, "cannot be achieved without a high degree of social discipline". Hence he argued, "everything that stands in the way of effecting basic changes should be removed "[24] 'Everything', we know, included opposition parties, free press, independent judiciary, fundamental rights and democracy itself

Indira Gandhi herself seemed to believe that opposition was unnecessary in the initial phase of building a country because "there were not many paths to choose from when they were doing the basic things' In an interview to the *New York Times* as late as in early February 1975, she explained, on this ground, "why so many countries have given up democracy" [25] In a biography of Indira Gandhi, Uma Vasudeva quotes another statement made by her as far back as in early 1950s in which she said "In order to make the country strong, remove poverty and eradicate illiteracy, it would be better not to have any opposition parties "[26]

Portents

The ground was thus prepared for tampering with the system and for "increasing identification of the government with the Congress Party especially since the armed victory over Pakistan, in public media as well as elsewhere" [27] Reading the portent in these contributions to Parliamentary democracy a sober journal like the *Economic and Political Weekly* suspected as early as in September 1972 May be somebody has already taken a decision that to promote faster economic growth in the country, a guided democracy is the most essential of prerequisites " [8]

Analysing political trends in the country, the socialist leader N G Goray came to a similar conclusion in an article in *Janata* dated July 22, 1973, significantly titled Getting Ready for a Dictation'

In the European Conference on Modern South Asian Studies held at Heidelberg in 1972, Devid Potter of Britain's Open University expressed the view that in the circumstances it is hard to see how the contradiction can be satisfactorily resolved within the existing framework of India's political democracy' Elaborating the contradiction, he said, the middle class will not provide the leadership required for her [Indira Gandhi's] survival since it is against their interest to do, and the bureaucracy cannot provide the administrative capacity because it lacks the power to make it effective The common man has waited for a long time, and won't wait much longer "[29]

Not everybody could read 'the writing on the wall" that clearly Some of the present staunchest critics of Indira Gandhi had gone farthest along with her It would be too presumptuous to condemn all of them as opportunists and short-sighted

Assessment of her role varied from person to person and time to time According to Asoka Mehta, the period from 1966 to 1967 was her 'finest hour" when she was "honourable and honest" [30] Chandra Shekhar believed, "intuitively, she has always been a liberal and for the poor man [31] He and

his other 'young turk' colleagues in Congress tried hard to sell the idea of joint Indira-JP leadership Even Abdul Ghafoor, who as Bihar chief minister put up a last ditch fight against JP's movement, concurred with the view that "only two leaders, Mrs Gandhi and Mr Narayan, could salvage the nation" [37] Minoo Masani, lifelong friend of JP would not call the prime minister and her government fascist For, if they really were, he asked not long before the Emergency, "Would Jayaprakash be alive and functioning, would the great march in Delhi of 6 March 1975 have passed off so peacefully and successfully?" He also believed, "Only an adjustment between prime minister and Jayaprakash may provide the way out" [33]

'Progressive' Congressmen, scared of 'right reaction and 'imperialist designs', had no option but to be on her side Men like Siddhartha Shankar Ray, of that tribe "almost worshipped her" [34] He supported the Emergency which he thought 'should be there for a short period and used for the purpose of bringing back sanity to the country" [35] And a wise man like Jagjiwan Ram waited for the 'right time for the right action" There were also those who were "shocked at the truth" when it began to come out after the Lok Sabha elections [36]

From 1966 to 1967 Indira Gandhi disillusioned many supporters and dropped many colleagues, though her bandwagon made good the loss in quality by gaining in quantity In her climb to power and then absolute power she drew upon the support of many, however passive or partial at various points of time who had no faith in authoritarianism or personality cult much less in dynastic rule

Apart from such collaborators a section of the opposition also supplemented her efforts, equally unwittingly, in creating an atmosphere for authoritarianism She, in fact, owned many political ideas popularised by the opposition She tried to appear more nationalist more socialist and more anti imperialist than her opponents

Supplementary Roles

The main planks of the Bharatiya Jana Sangh and other militant nationalists were for instance, hostility to Pakistan, demand for making an atomic bomb unitary form of government and so on Many leftists shared some of these short-cuts to popularity

With India's victory over Pakistan and its split in two parts in 1971, annexation of Sikkim, atomic explosion concentration of power at the centre and emasculation of the states, growing identification of India with the third world, with anti-west overtones, increasing expenditure on and strength of India's armed forces, emphasis on unity and stability of the country and warning against external threats in the official statements and finally with her emergence as a strong leader, Indira Gandhi was able to steal much of the chauvinistic thunder of her opponents Jana Sangh leader Atal Behari Vajpayee was so swept off his feet at Pakistan's defeat in 1971 that he called her goddess Durga

Projection of Jana Sangh as her main opponent in the north on the other hand had the additional advantage of enabling her to rally non-Hindu and non-Hindi speaking communities, besides genuinely secular elements, round her

As fascism is essentially a manifestation of aggressive nationalism, all those of right or left, who made it as their main plank of opposition to the ruling party tended to contribute to the process of erosion of Indian democracy

Even a man like Vinoba Bhave used a chauvinistic argument in advising JP not to wage a struggle against the government He said 'With the United States arming Pakistan and China also helping her, it was not advisable to weaken the government [37]

JP's most outstanding contribution to Indian politics lies in his courageous and frontal attack on chauvinism On issues like relations with Pakistan, border dispute with China, dialogue with Sheikh Abdullah on Kashmir issue, status of Nagaland and making an atomic bomb he swam against the popular current He espoused the cause of autonomy of the states which had been reduced to a condition of glorified municipalities under prime minister Indira Gandhi's government [38]

Indira Gandhi borrowed populist socialist rhetoric with similar ease She adopted some socialistic measures like bank nationalisation ending privileges of the former princes and the ICS and land ceiling legislation

It was JP again who warned against confusing statism with socialism The growing concentration of wealth and power and rampant corruption according to him went ill with his concept of socialism [39]

JP's Assault on the System

Notwithstanding JP's dissent, there were many issues raised by the opposition, the authoritarian implications of which were not adequately realised at that time But where most of the opposition including JP, collaborated most effectively with Indira Gandhi was in her efforts to demolish the system

True, the system as it existed before the Emergency was ailing and defective in many respects But the crucial question was whether it was to be mended or ended and if ended what was it to be replaced by The then union home minister Uma Shankar Dikshit, who claimed to have been a lifelong admirer of Mr Narayan and wanted the country to benefit from his mature and conscientious advice', must have been quite earnest when he pleaded that 'the system of parliamentary democracy had been tested and found adequate in this country and as such, nothing should be done to damage it until a better, well defined alternative with proved efficacy was available" [40]

Since his *Jeevandan*[41] in 1954, JP carried on a crusade against parliamentary democracy, the Constitution, the party system and pursuit of power. His latest movement, however, was a negation of this crusade in every respect For he led the struggle for power on behalf of the opposition parties, which, far from being discarded, were the main instruments of his movement Moreover, the issue on which he got popular mandate was restoration of parliamentary democracy and the original form of the Constitution

To be fair, he was realistic enough to modify his earlier utopian ideas in favour of a workable strategy He made it vehemently and repeatedly clear that the Bihar movement did not aim at establishing a partyless democracy, though that remained his ultimate aim [4]

But if this did not remove confusion from the minds of some people it was not entirely due to their ulterior motives Though he never disowned his earlier political ideas the references that follow relate to the period after the last month of 1973 when he resumed active public life after one year's silence and started the last phase of his career

Inaugurating the All India Radical Humanist Association conference at Calcutta he said, It would not be wrong to say that the differences between the performance as distinct from the manifestoes of the various parties in or out of government, has been no more than that between tweedledum and tweedledee [4] Referring to his criticism of parties and politicians Sachchidanand Sinha rightly observes, At this juncture to generalise the guilt of politicians tended to minimise the guilt of those who held power and who alone could use it for good or evil [44]

JP did not hide his distrust of parties If the movement in the rest of the states (outside Bihar) he said is started by political parties, it is bound to fail [45] He wanted students and non party people to come forward and political parties to form a part of it He, in fact believed that the students and people's struggle committees 'are developing their own identity [46] independent of and more important than parties, which later proved to be almost an illusion He did not visualise the people's movement as one of the united front of political parties" [4] In reality was it anything much more than that? How strongly JP wished to bypass political parties would be evident from a note he recorded in his *Prison Diary* on September 6, 1975 [48]

His distrust of democratic institutions, however, became infectious A good parliamentarian like Atal Behari Vajpayee announced on September 8, 1974 his decision to resign from the membership of the Lok Sabha (though his party did not allow him to do so) on the ground that "parliamentary democracy was no longer an effective instrument to serve the people in India and had become a good means to acquire power and prestige".[49] Similarly Minoo Masani

reproductive JP's point that "the lay neither through elections nor parliament"[50]

JP was not content with merely overthrowing the Congress rule He demanded that "whole system must go lock stock and barrel"[51]

Distrust of Western Democracy

He shared with Congress leaders and pro-Congress intellectuals their lack of faith in the 'western model' of democracy, quoted earlier He regretted the failure to understand what he was doing in Bihar by "Indian intellectuals cast in the mould of Western thought (in which I include also the Russian) and modes of action'[52] NJN had earlier advised him to grasp "the techniques of gaining power and using it by means of the party system"[53]

JP, on the other hand, cited Gandhi's example, who dominated the political scene and was the supreme commander of the nationalist forces, but declined even to be an ordinary member of the Indian National Congress "After independence, too, he did not seize supreme power as the Western pattern would have expected him to do"[54]

Obviously JP's ambitions far exceeded those of Indira Gandhi who was content to be merely prime minister, however powerful, of the country He however, overlooked the fact that at that time Gandhi was effective mainly because he had a powerful instrument like the Congress Party and a personality like Jawaharlal Nehru to mobilise people and to wield government power JP's own movement acquired political effectiveness only after a viable and credible alternative to Congress and Indira Gandhi emerged in the form of Janata Party and Morarji Desai respectively

Nobody can deny JP's monumental contribution to creating these alternatives But till they were created NJN had a point in arguing that his "saintly virtues were politically meaningless" NJN may be a little harsh in his comments but they indicate the extent of confusion about potentialities of JP's movement among those who were not hostile to him He wrote "From the Congress point of view if Mr Jayaprakash Narayan did not exist, it would be necessary to invent him Any establishment under the pressure of increasing discontent attempts, as a matter of expediency, to create a diversion And this is what JP has obligingly, it also unwittingly, done "[55]

Authoritarian Backlash

The real danger was not that JP was providing the safety valve to Congress, but that under the pressure of his movement "if besides Congress, the system also collapsed, we are not sure what would replace it". In fact, "in the ensuing confusion and instability, the danger of an authoritarian backlash cannot be ruled out". An authoritarian trend in Indian politics was also visualised, "if the movement gets exhausted on account of organisational and ideological inadequacies or superior strength and tactics of the establishment"[56]

The fateful judgment of justice Jag Mohan Lal Sinha of Allahabad High Court, which set aside the election of the prime minister, on June 12, 1975, precipitated the backlash The battle lines were clearly drawn and its last to-the-finish phase began The parable about a cat which when cornered became desperate, with which Uma Vasudeva starts her book *Two Faces of Mrs Gandhi* applied to both the sides None had heeded its moral, viz, "If you want to hit the enemy, you must leave a way out for him Otherwise his despair can make him a killer"[57]

In a mammoth rally at Delhi on June 25, the opposition led by JP gave an ultimatum to Indira Gandhi to resign, or face a countrywide agitation from June 29 JP also gave a call to the police and military not to obey any 'illegal orders of the government"

If the issue was to be settled merely by the size of the demonstrations, Indira Gandhi had already won it On June 20, a bigger rally was held near the boat club of New Delhi, to express solidarity with the prime minister Described by her as "the biggest in the world",[58] it was mobilised with the help of the government machinery of the neighbouring states, as was admitted by their ministers and officials of that time before the Shah Commission She left nobody in doubt about her determination to stay on as prime minister

Around the midnight of June 25-26, the president signed the proclamation of internal Emergency The cabinet came to know of it and gave *ex post facto* approval to it at a hurriedly called meeting at six in the morning The external emergency was already in operation since the Indo-Pak war of 1971 But the double emergency created the desired psychological effect

Collapse of Resistance

The Emergency operation was remarkably neat "Not a dog barked", the then defence minister Bansi Lal is reported to have boasted Quoting Cromwell, who had made the same comment when he dissolved the British parliament, Ivor Jennings said. "The dogs bark in parliament if there were no parliament they might bite"[59] 'Even I was astonished," observed Indira Gandhi, "as far the public reaction to the declaration of Emergency" She said "When the Emergency was declared there was not a murmur at all There was not a case where the police had to be used"[60]

These are no empty boasts. Almost all the chronicles on the Emergency, despite their critical attitude to it, attest to this fact According to the authors of *Decline and Fall of Indira Gandhi*, "the first impact on the Indian people of the Emergency regime was favourable For the first six months everything went off swimmingly"[61]

Sachchidanand Sinha records, "The arrest of all top leaders of the political parties including Jayaprakash Narayan left the nation cool. There were no spontaneous strikes, no demonstrations, no uprooting of rails".[62] CGK Reddy went round the streets of Delhi to find "at least a few of the lakhs of people, who had gathered only the previous evening to hear JP, determined to bring down the prime minister and would now organise themselves to resist what was virtually a dictatorship" His "expectations and hopes were belied"[63]

Acharya Kripalani, the seniormost public man of India, chided the people for their role during the Emergency Addressing a big public rally at Lucknow after the Emergency he said "You are the people who were shouting slogans in favour of Mrs Gandhi and today are raising slogans against her' He asked, "Is it not shameful?"[64]

The journalists, as the minister of information and broadcasting, L K Advani observed, crawled when asked to bend According to Arun Shourie, "the intellectuals lacked even the most elementary courage They collapsed without struggle They were almost ineffective"[65] Phaneswarnath Renu, the lone Hindi writer in JP's movement, despaired that "the famous and established writers, who should have lent expression to the suffering of the millions, were silent"[66]

JP begins his *Prison Diary* (on July 21, 1975) with the following words of despair "My world lies in shambles all round me Here was I trying to widen the horizons of our democracy And here am I ending with the death of democracy I wonder what all those ladies and gentlemen are saying now who used to tell me that I was the only 'hope' for the country "[67]

Miscalculations?

"Where have my calculations gone wrong?" The earnestness with which JP asks the question deserves equally serious response To say (as JP records in the *Diary* on the following day) that Indira Gandhi was by "inclination and conviction a dictator"[68] is not an adequate answer

Jack Anderson and Les Whitten wrote in *Oklahoma Journal* (July 4, 1975) "Under similar circumstances Richard Nixon, whatever the sins on his head, never attempted what the sanctimonious Indira has stooped to "[69] But why? Was it simply because Nixon was more virtuous? They hasten to add "Had he done so, no one of significance would have obeyed his orders "

JP admits his mistake in presuming that people and the Congress Party would not allow Indira Gandhi to do what she did[70] But the crucial question remains Why did people, the Congress and all men of any significance succumb to what Arun Shourie characterises as "the mildest possible dictatorship, compared to what a Djilas or a Solzhenitsyn and had to put up with"[71]

There are quite a few pointers towards a fuller explanation of the phenomenon in the foregoing account of facts and events, which preceded the long night that dawned on June 26, 1975 and lasted for 572 days.

Some of the factors touched upon in this context include the psychological make-up of the leader and the people, state of the economy, political climate, decline of ethical standards, organisational and ideological inadequacies of the opposition parties, conformism of the intellectuals and shortcomings of the system as a whole and JP's assault on it without offering a viable alternative. Had not the same type of stuff – leaders, intellectuals and people – shown a better mettle during the British Raj?

Why Regimentation Succeeded

According to Sasthi Brata, the British Goliath had an Achilles' heel in the form of "Principles" whereas "the leonine lady who was in all but name the dictator of India, had no such weak spot".[72] But an important difference between the two regimes, let us admit, was that the Indira government was not as much hated as the alien British government was. It was, therefore, easier for the former to regiment national life.

In a developing independent country agencies of promotion of art, culture and literature, institutions of education, most of the media of publicity are run by the state. The intellectual, therefore, depended growingly, and during the Emergency almost exclusively, on the state for his survival, recognition and affluence. The cost of not collaborating and reward of collaboration increased rapidly.

In India stakes in political power are also very high. "The difference between successful and unsuccessful politics is the difference between prosperity, social status, power and a meaningful life on the one hand, and poverty, oblivion, sense of impotency and existential meaninglessness on the other."[73] In order to cling to power and retain the confidence of the leader a politician was thus willing to pay much more price in terms of principles and self-respect than he would in a normal democratic set-up. For the same reason, the ruling party, in general, and its leader in particular, became desperate and ruthless for retaining power.

In order to increase its acceptability, the Emergency regime adopted many slogans and programmes popularised by the opposition. Anti-smuggling drive, income tax raids and anti-inflationary and price control measures were part of this policy and must have earned it some popular goodwill also.

The declared objectives of the regime were not merely confined to administrative efficiency, social discipline and economic amelioration but also extended to "a comprehensive transformation of society", a phrase often used by the prime minister and her son and the nearest equivalent to "total revolution". The tasks of the new revolution ranged from making India a world power to eradication of social evils like dowry, from economic reform to ecology (tree plantation), from [illegible] renaissance to family planning and so on.

Donning JP's Apparel

Indira Gandhi quoted profusely from the scriptures written by JP, of course, without acknowledgement. Instead of quoting chapter and verse, a few samples might suffice.

> Democracy does not mean voting once in five years or whatever it is. We want to make democracy more meaningful to all the people.
>
> I am only continuing the revolution which was begun by Mahatma Gandhi, because the aim of that was a change in the structure of society, fight against the system..
>
> The aim . is not only a better material standard of living for the people, but a much wider concept of what is a better human being.
>
> The very concept of democracy is not the same in every country.
>
> Our concept of democracy is a much wider and deeper than the Western or the Eastern bloc's
>
> If they [people] get a feeling that this system... is not serving the purpose of the larger number of the poor people, why should those people tolerate it?[74]

It is hardly necessary to quote corresponding statements of JP to prove that he had said similar things in almost similar words. Sanjay Gandhi's emphasis on the role of "youth power", debunking of 'isms' and ideologies, talk of all-round social change and condemnation of communism and the CPI, too, were not entirely alien to the thought-frame of JP.

That people were more important than institutions was implied in the popular movement for the dissolution of the state assemblies. Indira Gandhi extended the logic to pronounce supremacy of people even over judiciary and the Constitution. She sought legitimacy of her leadership from crowds of people. The technique of collecting such crowds was, however, by then well known.

She was also not far wrong in saying that "the whole talk of changing the Constitution emanated from the opposition".[75] The very idea of amending the Constitution to restore "parliament's sovereignty", which had been abridged by a Supreme Court judgment, was first mooted by the late socialist MP, Nath Pai. The opposition had made no mean contribution to generating the populist wave which Indira Gandhi tried to ride.

The fate that Indian democracy eventually met on June 26, 1975 – which JP called its death and Indira Gandhi described as its derailment – was not merely due to a miracle brought about single-handedly by a superhuman dictator. If the opposition got [illegible] phenomenon exceeded the group of intellectuals, if many leaders, claiming to be democrats, connived or remained passive, if people did not offer effective resistance, if the entire system succumbed to the will of the supreme leader and if she imposed an authoritarian regime on the country without any glaring violation of the letter of the Constitution and without large-scale deployment of police or army, there are enough cogent reasons. A further and thorough study of these reasons should be more rewarding than merely loading the entire nation with a sense of guilt.

Moral Judgment

However, an explanation of how Indira Gandhi outmanoeuvred her adversaries, at any rate in the first round, is no justification of her actions. Those who were tactless in defence of democracy or whose ideas were twisted and exploited cannot be equated with those who deliberately usurped and misused power. The tyrants cannot be equated with the victims of tyranny. The corrupt-sadist caucus cannot be equated with revolutionary and idealistic youth who rotted in jails. The oriental despotic sultana cannot be equated with the saint who has renounced all wordly goods.[76] In no case can the excesses and crimes of the Emergency be condoned.

Hitler became a dictator by a similar combination of factors; through a decree of emergency; innocently provided for in the otherwise democratic Weimer constitution, subsequently amending but without suspending it, and due to appeasement policy of governments of democratic countries, in particular the one led by Chamberlain in Great Britain, and confusion and miscalculations on the part of liberals, socialists and communists. While appropriate lessons must be learnt from the follies of the founding fathers of the Weimer constitution, Chamberlains, liberals, socialists and communists, they cannot, in fairness, be treated on par with Hitler and his barbaric tribe in a moral judgment. In comparison, opposition in India fought valiantly and indeed won the final round of the battle: notwithstanding its strategic and ideological deficiencies discussed earlier, and unwitting contribution in pushing the country towards authoritarianism.

While in the interest of rigorous analysis and terminological exactitude, neither the Indian Emergency can be described as Nazism nor Indira Gandhi as a Hitler, what happened during the Emergency was quite unusual judging by the standards of administration India was used to, not only since independence but perhaps also during most part of British rule. Was S Nihal Singh exaggerating when he said, "She [Indira Gandhi] subjected the country to the most tyrannical regime it has had for two centuries"?[77] Indira Gandhi's minister for information and broadcasting, V C Shukla,

of India editor Girilal Jain tried to argue in a meeting that even during the British regime such restrictions were not imposed on the press as were being done during the Emergency, Shukla cut him short with: "This is not the British regime. This is national Emergency."[78]

Ban on 26 parties and detention of a total of 1,40,000 political prisoners during the period of the Emergency might also be an all-time record.

Again, the state machinery under the prime ministership of Indira Gandhi acquired unprecedented power, without adequate checks and balances. At the centre, she had roughly 7,00,000 policemen, belonging to the Border Security Force, the Central Reserve Police, the Central Industrial Security Force and the Home Guards; asides 80,000 police in the states and armed forces totalling one million.[79] In addition to numerous intelligence agencies, she specially relied on Research and Analysis Wing (RAW) for political intelligence and operations. Starting with a budget of Rs 5 crore, it reached Rs 100 crore.[80] The publicity media, with censorship on the press and state ownership of TV and wide network of radio, gave complete monopoly to the government over sources of information to the people. The growth of communications also helped to improve the efficiency of the instruments of repression. Not content with these powers, Indira Gandhi added many legal and constitutional weapons to her armoury, to transfer power from judiciary to parliament, from parliament to president, from president to executive and finally to herself. Again, not content with arbitrary powers thus acquired, she created an extra constitutional authority headed by her son, with extra constitutional agencies and unlimited resources, which necessitated her connivance at growing corruption.

It is, therefore, not surprising that justice J C Shah, heading the one-member commission inquiring into excesses during the Emergency, was "shocked" by the revelations made during just 12 days of hearings. It appears, he said, "that there was no safety of anyone. Persons could be whisked away, houses could be searched, any amount of indignities could be inflicted on the people with no redress". He was amazed that "all this happended in a civilised nation".[81] The people bailed out by the courts were re-arrested at the jail gate in a large number of cases.[82]

Total Counter-Revolution

These sordid happenings need hardly be catalogued or detailed here, as they are by now well known and are being exposed by authoritative agencies. But it is worth noting that no new repressive machinery was created during the Emergency. By and large the same system – political and administrative – which was supposed to have served the [illegible] democratic regime became subservient to the new authoritarian regime. Some of the stalwarts of the freedom movement, senior IAS and ICS officers, inheriting British tradition of bureaucratic autonomy, members of the prestigious professions and the best intellectual talent of the country were willing tools of Indira Gandhi. Most of them conformed to the new regime in a manner which in political parlance is called opportunism.

The same persons are capable of behaving differently in different situations and under different systems. The role of a cog is determined more by the machine of which it is a part than by itself. Hannah Arendt has argued that Adolf Eichmann, who sent millions of European Jews to their death, was not the sadistic killer he is made out to be, but was a run-of-the-mill bureaucrat of the Third Reich. Evil, she in effect says, is rarely ever the work of evil persons, but of ordinary law-abiding citizens like you and me...Most people operate at a level of morality where the sanction of an authority magically turns evil deeds into good and good deeds into evil. This magical transformation is facilitated by the tendency of authoritarian and repressive regimes to concentrate decision-making in a few hands."[83]

Rarely had the Indian nation in its long history undergone such a comprehensive transformation in such a brief period. The impact of the Emergency was all-pervasive, on the psychological and moral behaviour of the people, politics, economy, culture, administration, academic and educational institutions and social life.

This was the nearest ever approximation to a total revolution albeit in the counter direction. "We find today," laments JP in his *Prison Diary* on August 7, "the dark clouds of total counter-revolution encircling us".[84]

The Dialogue

The leadership of the opposition was inevitably overtaken by feelings of helplessness and despair. Acharya Kripalani conceded: "Humanly speaking, there seems to be no remedy."[85] JP was afraid he would not see his world (in `shambles' at that time) put together again in his lifetime. "Maybe," he despaired, "my nephews and nieces will see that . Maybe".[86]

Many scholars, western and Indian, :cast in the Western mould" (to use JP's phrase) found confirmation of the theory that the western democracy did not suit the developing world. 'India got a system suited to her genius', was the verdict of this tribe.

Indeed, Indira Gandhi's finance minister Y B Chavan claimed: "Democracy has not only not suffered a demise in India, but is more living and throbbing than ever."[87] And much after the Emergency was over, she herself had the temerity to say: "If you look back you will agree that there has never been more democracy in the country before I became prime minister, Never, Never".[88] We seemed to be approaching the Orwellian world of 1984.

Most of the opposition, on the basis of its assessment of the situation, not entirely unrealistic at that time, sought a negotiated settlement with the government, which according to C G K Reddy, "exhibited in a most flagrant form in mid-December 1976 when the representatives of Congress(O), BLD, Jana Sangh and Socialist Party discussed and tacitly approved of a document. They chose to call it a working paper". He describes it as pure and simple a surrender document.[89]

On December 14, 1976, George Fernandes, the then chairman of the Socialist Party, in a letter to JP strongly disapproved the move of the opposition parties. He wrote: "The opposition leaders lack not only perspective but also in nerve... This is not the stuff that can oppose and overthrow a dictatorship; if anything, this is the stuff that breeds and nourishes dictators... I am aware of your own frustration with the opposition leaders."[90]

Asoka Mehta, on the other hand, reported to the Working Committee of Congress (O) that the meeting of the opposition leaders "approved" the approach (note of the BLD) and "welcomed a dialogue" (with the government).[91]

Leftist Take-over?

Did Indira Gandhi suddenly turn hostile to the Communist Party of India and the leftist lobby within her party towards the close of 1976 in order to accommodate the non-communist opposition? Or were her overtures to the non-communist opposition due to a fear of a leftist take-over? Her fears on this score are discussed by Uma Vasudeva in one full chapter of her book, comprising for one-fourth of it.

JP also suspected that the CPI, communists in disguise within Congress and Soviet Union had planned to take over the country. He gives even a benefit of doubt to Indira Gandhi who "has become a stooge". But he warned, "A time may come when, having squeezed the juice out of Mrs Gandhi, the Russians through the CPI and Trojan horses within the Congress will dump her on the garbage heap of history and instal in her place their own man". "This plan," according to JP "is not known to Indiraji though she might have some private suspicions."[92]

Who was using whom? Or were both trying to use each other for their respective ends? But it appears each was preparing to get rid of the other. According to Bihar Congress leader Sitaram Kesri, "it was to neutralise this [the Communist] threat that Sanjay was built up".[93]

However Sanjay Gandhi, who was compared by the then Congress president Dev Kant Barooah to Maharaja Ranjit Singh, Shankaracharya, Vivekanand and Akbar,[94] grew into an important autonomous

phenomenon and more than anybody else shaped the eventual form and content of the Emergency He liked dictatorship, as he told a West German paper once though "not of the Hitler type" [5]

As far back as August 6, 1975, he lashed out at the CPI the principal political ally of her mother In an interview to Uma Vasudeva, the editor of the *Surge* he said, "If you take all the people in the Communist Party, the big wigs, even the not so big wigs – I don't think you would find a richer or more corrupt people anywhere "[96]

Though Sanjay Gandhi appeared to be building a political force in particular through mobilisation of the youth independent of and in opposition to the communists within and outside Congress and even parallel to the Congress Indira Gandhi herself openly owned and intensified the anti communist campaign when dialogue' with the opposition began in December 1976 The Guwahati session of the Congress marked a turning point in its ideological direction The communist sympathisers within the party started falling from grace and position since then

Decision on Elections

Apart from a possible Freudian death wish, which cannot be verified, and a rational expectation that the room vacated by the communists and their fellow travellers in the positions of importance would cause a vacuum which might irresistibly attract anti communist leaders and parties towards her Indira Gandhi's motive in ordering elections in March 1977 was also to raise "a constitutional scaffolding to the power structure that she thought belonged to herself and her family" [97] The state of the national economy and politics including that of the opposition parties must have encouraged her in assuming that the time chosen by her for seeking constitutional legitimacy of her regime was most opportune The elections in neighbouring Pakistan a little earlier which projected it as a more democratic country than India, hurt Indian pride and prestige and might have precipitated Indira Gandhi's decision to follow suit Her confidence in mastery over tricks and tactics of the election game and manoeuvring capacity in normal political process, too was not misplaced

Had Indira Gandhi not decided to hold the parliament poll a year ahead of the schedule, it is generally agreed there was no imminent threat to her regime In fact the opposition leaders were as surprised at the popular response they got and their eventual victory in elections as at the collapse of their movement in June 1975

Miscalculations

Where did Indira Gandhi's calculations go wrong' It is as vital a question as the similar question JP had asked himself after the Emergency was clamped down on the country. They provide clues not only to the fortunes of the two most prominent personalities of the time but also to the political behaviour of the people and political developments in the country

What are the factors that hurled Indira Gandhi down almost grotesquely from the affections of her people and her place in history?[98] How was democracy resurrected in the country after its unceremonial burial barely 19 months ago?

Our present knowledge of the causes of rebirth is as woefully inadequate as that of the causes of the death The democratic revolution however, was as bloodless and peaceful as the earlier authoritarian 'coup'

Is that a reflection on the character of Indians on their capacity to suffer, their passivity their resilience and their potentiality of revolt? Is the Indian mind schizophrenic half democratic and half-authoritarian? Or were the dictator and the dictatorial regime imperfect?

Some scholars have made generalisations regarding ambivalence and lack of sharp commitments of the Indian mind, perhaps on account of the Hindu tradition of simultaneous belief in many mutually contradictory gods and scriptures If this were true it would answer Acharya Kripalani's rebuke to the people for shouting slogans for Indira Gandhi on one occasion and against her on another

To some extent these generalisations about the psychology of people hold good everywhere People do tend to reconcile to the *fait accompli* An authoritarian system develops cracks not when the terror and suppression are at their height but when the system to which people get used shows signs of relaxation and modification For, with sudden changes in the pattern and direction of a system reflexes of the people get deconditioned

People Deconditioned

Thus when anti-west pro communist ideology of Congress was suddenly reversed, dialogue started with yesterday's 'traitors parliament's life was cut short and people who had taken their rulers for granted, were given an opportunity to choose and change their rulers, the conditioning process was rudely shaken As a consequence, new forces were released that neither the ruling party and its intelligence agencies nor the opposition could anticipate

This does not, anyway, imply that the dictatorship could have lasted forever, if the elections had not been held when they were It is possible, though hardly necessary for our present purpose, to speculate on the form the urge for freedom and dissent might have taken, the way resistance might have been organised, the type of contradiction that might have developed within the authoritarian system and other factors, internal and external, that might have deconditioned the conformist part of the population in that case.

The prospects of deconditioning itself depend on the extent and manner reflexes of the people have been conditioned by the system Inadequacy of and incoherence in the ideology of the Emergency, organisational shortcomings of the ruling party and inefficency of the administrative apparatus are some of the factors that are responsible for the inability of the system and its leaders to win emotional and intellectual allegiance of the people in sufficient measure The concept of dynastic rule, which is the popular image that the Emergency eventually acquired, was in no way inspiring Moreover whatever her achievements before and during the Emergency, "in grabbing absolute power, Indira Gandhi let herself in for absolute corruption and, on balance, when the balance sheet came to be drawn, the gains to the country for which she sought credit were like dust in the scale against the degradation into which she had dragged India' [99]

Even Indira Gandhi and her apologists do not deny that excesses were committed by overzealous bureaucrats in implementation of official policies Family planning and slum clearance drives, in particular, hit poor and backward communities which had been traditionally loyal to the ruling party Shift in their loyalty was a crucial factor in turning the electoral tables against it

The greatest handicap of the authors of the Emergency was their inability to disown Gandhi and Nehru for obvious reasons That they were a source of inspiration to the opposition and embarrassment to the ruling party would be obvious from the statement made by the former minister of information and broadcasting, V C Shukla, before the Shah Commission He said "quotations from national leaders were censored because thay had faded in the pages of history and most of them were relevant to the days of the Raj Their reproduction would have created misunderstanding "[100] Jawaharlal Nehru's own paper, *National Herald*, stopped publishing his famous quotation on its masthead which read "Freedom is in peril, defend it with all your might"

It is not a mere coincidence that October 2, 1975, the first Gandhi birthday anniversary after the declaration of the Emergency, was marked by arrests of prominent public men including octogenarian Acharya J B Kripalani, a veteran parliamentarian, H V Kamath, and *Sadhana* editor Mihir Thatte for organising or participating in celebrations of the birthday of the father of the nation, which were banned at several places

The urge for freedom, a basic human urge, further inspired and institutionalised by the illustrious leaders of India could not be easily banished from the minds of the people. When the opportunity came to choose between freedom and bondage, their choice was obvious and unmistakable. The common man demonstrated, what the intellectual had

not appreciate that he valued freedom for less than bread.

Finally, it was JP's personality that made all the difference in the outcome of the titanic battle between the rival forces India's high commissioner in the UK, N G Goray, was not indulging in undue flattery or exaggeration when he said If Jayaprakash Narayan had not led the 1975 movement Mrs Gandhi's dictatorial rule would have continued indefinitely and a nation of 600 million would have lived in chains [101]

India was fortunate to have a Mahatma to lead her liberation struggle She was again fortunate that a saint returned from 'jaws of death' to be available for leading what is called the second liberation struggle, barely three decades after the independence of the country Did not Lord Krishna himself declare in the holy *Gita* that he would incarnate to rescue India whenever dharma declined?

But should the basis of a modern secular India be built on a theological belief? Should not the guarantees of democracy be rather secured in the consciousness of the people avenues of articulation of their democratic urges and effective institutions of democracy including a system of checks and balances a well balanced party system free press, free judiciary and other constitutional agencies and provisions?

Total Revolution

JP himself was not content with what is called the Janata revolution He rather felt that the people s movement has suffered to some extent when the people engaged in spreading his message were voted to power What we lack today ' he said, "is a well-knit revolutionary organisation that can plan and work out programmes of action ' He wanted all those groups that profess total revolution to merge into a united organisation [10]

JP s distrust in effectiveness of political power, political parties, constitution and institutions does not seem to have declined appreciably despite the contrast in their use and misuse after and during the Emergency respectively

The two words of Total Revolution' are today as hollowed as they were dreaded during the Emergency In either case no justice has been done to the concept which deserves a more analytical and thorough examination

According to JP, it is a combination of seven revolutions - social, economic, political, cultural, ideological or intellectual educational and spiritual While it is conceivable that a group of persons might agree on an integrated view of a new society, the implications of forming "a united organisation" to bring it about are rather ominous For no single institution, party or organisation can represent the diverse aspirations of a whole man, without emasculating some of them Such experiments have been tried only in totalitarian societies and were approximated in those old societies in which state and church were merged

Indeed pluralistic institutions of democracy alone differentiate it from totalitarianism Thus a person may simultaneously belong to a political party, a religion, a culture an economic class a nation, a region and an ideology Loyalties to various institutions cut across one another People with different economic and political views might have a common spiritual or social philosophy In fact a number of permutations and combinations in terms of beliefs in diverse fields do and must exist, excepting in a totally regimented society

While a case can surely be made for radical changes in the seven fields mentioned by JP complete agreement on quantity and quality of changes in all fields must not be a precondition for action in a particular field Despite inevitable inter-connections between various walks of life, each one must be ensured a degree of autonomy in a free society

As observed by Bertran D Wolfe 'the essence of the total state and the totalitarian party does not lie in tyranny or terror although these are necessary in varying doses and at varying stages to atomise and subjugate society But the essence of totalitarianism is painfully simple and lies in its very root the word total '[103]

Acharya J B Kripalani did not elaborate his point but similar apprehensions must have weighed with him when he criticised the concept of total revolution as alien to Gandhism [104]

This is not as such intended to be a critique of JP's thought Those who are interested in the subject are referred to a thorough though a little irreverent study of it in an article by the present writer in *Conspectus* (India International Centre, New Delhi No 3, 1966) and a chapter in *Democracy and Non Violence*(Gandhi Peace Fondation 1968)

In view of the fact that JP became the rallying point and a symbol of popular revolt against authoritarianism, his ideas have a vital bearing on the prospects of democracy in India and hence deserve deeper analysis and dispassionate criticism Present uncritical adulation would do him as much injustice as past sweeping condemnation used to do

Prospects of Democracy

The overthrow of an authoritarian regime within so short a span of time and dismantling of its structure so effectively and thoroughly have undoubtedly inspired democrats within as well as beyond India In view of the experiences which they have gone through and the lessons they could not have failed to learn therefrom politicians, parties, intellectuals, bureaucrats and people of the country are unlikely to be as pliant and servile to a would-be aspirant to dictatorship as they were the last time.

However, while the great March revolution answered many vital political questions decisively, it left quite a few unanswered and posed some fresh ones also

How can, for instance we discuss the prospects of democracy in a country where there is not even a broad consensus on what is its essence? What is more important popular participation or freedom?[105] Is a multi party system an essential prerequisite of democracy or only a transitional necessary evil? Would major parties of the country survive their internal convulsions? Would viable alternatives – or coalitions of them – remain available to the people from which they could freely choose their rulers periodically?

JP did not strike a very optimistic note when he said "Disintegration of Janata Party or fall of its government at the centre will lead to dictatorship" [106] For as long as the fate of democracy is linked with that of a party or a leader, it cannot be considered secure But how enduring is the federation of the Proudhian Kropotkin (utopian anarchist) line of s arvodya social democracy and militant nationalism?[107] Why was the base of the Janata Party essentially confined to Hindi speaking Hindus? What conventions and institutions are proposed to reconcile and accommodate the diverse identities of people based on, say caste religion, language, region class and ideology instead of wishful and utopian ideas about eliminating them

Acharya Kripalani was equally concerned over the future of democracy in India If people do not submit themselves to voluntary discipline, ' he warns they cannot escape the consequent imposition of totalitarian discipline "[108] How can what Gunnar Myrdal called a soft democracy or functional anarchy be made a disciplined, dynamic and efficient system capable of delivering the goods the common man has come to expect of it? How can the system be made to function even by and for human beings as they are – and are likely to remain – and not as they should be?

The following remarks about the prospects of democracy in Indian by the present writer in 1959 may not be entirely irrelevant

The addition of new adherents to the cause of secularism and democracy – as the extreme right and left were forced to move towards the centre – has rather diluted their original content For the influence of the new converts, who could not outgrow or reject their past thought and behaviour patterns, is tending to modify these concepts The debate about the futility of parliamentary democracy within the democratic camp has added to the confusion The crisis of democracy is mainly due to a crisis of confidence in the democratic ranks The Indian democrat is now not very sure of his own mind [109]

The triumph of democracy over authoritarianism in 1977 seemed to have

convert the whole nation to it in principle. But to the extent the concept of democracy is diluted and loses its precision in the process, its gain was offset to that extent. The triumph had also almost ensured it against threats from avowed outside enemies. Confusion within what claims to be the democratic camp about what really constitutes democracy and what are its constitutional, institutional and economic concomitants may pose a greater threat to it. Moreover, elements entrenched within the system, in its economy, politics and administration, interested in and capable of manipulating it to their group or personal ends, can still thwart the process of stabilisation of democracy in India.

Finally, democracy "is seriously threatened from within by perfectionists".[110] Totalitarianism, after all "was evolved into a pattern of coercion and centralisation not because it rejected the values of 18th century liberal individualism but because it had originally a too perfectionist attitude towords them".[111]

A fuller discussion on prospects of democracy in India would be beyond the scope of the present study. But perhaps having been forewarned, Indian democrats could forearm themselves. If the intelligentsia could turn its back on "the shabby trivialisation of the causes, the incidence and the consequences of the Emergency, in the form of most books available so far on the period"[112] and undertakes a more rigorous scrutiny of them – with sharper analytical tools – it might enable the democratic forces to take the situation by the forelock.

Technology, Strategy and Competitiveness

Chiranjib Sen

Liberalisation and Industrial Development in the Third World: A Comparison of the Indian and South Korean Engineering Industries by Staffan Jacobsson and Ghayur Alam; Sage Publications, New Delhi, 1994; pp 256, Rs 275.

LIBERALISATION has changed the rules of the game for Indian industry, but it would be impossible to claim that the 'caged tiger' (the *Economist*'s graphic image for the pre-liberalised Indian economy), now free at last, has leapt into the competitive jungles of the global market economy. The 45 years plus industrial infant is still a cuddly cub. Meaner animals are prowling nearby, and threatening to invade the cage itself by taking advantage of the open door. Economic reformers believe and hope that the increased competition resulting from liberalisation will spur Indian industry to graduate from chronic infancy towards maturity. This book seriously questions the validity of this complacent line of thinking. Competition does not necessarily lead to competitiveness, much else is involved. This is the central message of this book. It argues that graduating from the so-called infant industry stage is far more complex than is implied in the simplistic view which puts the entire burden of inefficiency on protectionism. The global industry is itself changing rapidly It is a 'moving target'

For successful entry, the acquisition of technological competence is absolutely crucial, and so is the strategic positioning of these third world firms in the global industry that they seek to enter. And hence the continuing importance of appropriate policy. Alice Amsden, author of an influential book on South Korea (surprisingly not cited), noted the basic dilemma of industrial policy in developing countries. The technology gap between globally competitive Northern firms and those in the South has become so wide in recent decades that many developing countries face an uneasy choice between having inefficient domestic oligopolies propped up by protection, or having their domestic industries eliminated by global competition. The South Korean answer to this difficult dilemma was to seek a third alternative. They attempted to develop globally competitive industries even in the technology-intensive sectors. How successful have the Koreans been? How could they achieve what they have? What are the prospects of the Indian liberalisation? These are the questions on which this book tries to shed some light. It will interest those who believe that there is a need for national economic strategies even under liberalisation, and that building up national industrial capability through policy intervention is important even as developing countries globalise. This book will certainly go against the grain of those who argue that unshackling market forces is all that is needed, or that in the globalised economy the national identity of firms is irrelevant.

The distinguishing features of the book are two-fold. First, it distances itself from traditional economic approaches to trade and industrial policy, particularly with respect to the concept of infant industry protection so common in inward-looking industrial strategies. The theoretical stance adopted by the authors, is a so-called 'management perspective on the entry process', strongly influenced by Michael Porter and associates. This allows them to take a more nuanced multidimensional view of what 'infancy' of industry means, and to assess the transition process of firms more satisfactorily The key idea is that within an industry, and in particular a global industry, firm behaviour is not homogeneous. Industries are characterised by clusters of similarly behaved firms cutting across national borders ('strategic groups'), whose behaviour pattern is classified by Porter into four generic types The similarity of strategic behaviour is based on the acquisition of comparable levels of resources and capacities. Strategic group members compete along similar lines in such areas as sale volume, product diversification, R and D, marketing channels. In such a situation, when developing country firms enter a global industry, the authors argue, their maturation must be judged in relation to the capacities required to compete in the strategic group they seek to enter. To achieve a mature status, a firm must have comparable competitive strength with other members of their strategic group. Moving from one group to another is possible but involves a major shift in orientation and high costs. To flounder in between is not a viable proposition.

The second distinguishing feature of the book is a set of four comparative case studies of engineering industries in South Korea and India to which this framework is applied. The industries, examined are: hydraulic excavators, machining centres, integrated circuits, and plate heat exchangers The choice of industries is justified by the authors as follows: "Each of them is to some extent a core product. Excavators constitute the core of the construction machinery industry; machining centres are one of the most important machine tools; integrated circuits make up the backbone of the whole electronics industry; and plate heat exchangers are a critical component in a range of process industries."

A fair amount of information on these industries is compiled, and an attempt is made to analyse the entry and maturation process in the two countries. In each case, there is a broad review of the global features of the industry – which are the major international firms, what are the patterns of strategic clustering and behaviour in the global industry. The infant industry in the two countries is then compared against the relevant global group to get an assessment of their progress and prospects. There is a comparison of Indian and Korean efforts for each industry. Incidentally, there is really no contest at all between the two countries, the study shows. Patriotic Indians (who may be secretly hoping that in at least one engineering industry in the sample, India may have done better than Korea) will need to seek solace elsewhere.

Thus, the book sets itself an ambitious task. The main conclusions that it reaches are reasonable and point the way to sounder policy It is quite emphatic that the length of the maturity period is longer than generally believed, and even in the Korean case it cannot be said that the firms have managed to enter the strategic group which has been targeted. It is better for policy-makers to have a clear perception of what strategic group is targeted for entry, as entry barriers and the learning process involved is different between them. Otherwise, wrong choices in technology procurement, for example may be made.

Another unequivocal conclusion of the book is that with the growing importance of scale economies in global engineering industries, it is virtually impossible to attain world class efficiency levels without an export market. And further, this necessarily

ntails also a refocusing of R and D efforts It means that some degree of global sourcing is essential, together with a focus on some areas for product development It means also that a view of competition which is measured by the number of competing firms in an industry is mistaken and clearly *passe* They point out the contrast between India and South Korea in this regard In India, prior to liberalisation there was a strong demand for foreign technology collaborations as a source of new product technology At the same time a very large proportion of industrial R and D design engineers were tied up in achieving higher local content ratio in the succeeding stages This emphasis on readapting the wheel if not reinventing it however, came at the cost of in house product development With liberalisation beginning in the 1980s while technology flowed more freely into the economy the overall effect on R and D has been highly negative The possibility of marketing mainly assembled imported kits led to cutbacks in R and D activities, as design activities became irrelevant The share of private industry in total industrial R and D fell Meanwhile the lowered entry barriers succeeded in creating a fragmented' industrial structure, characterised by relatively small firms This may have benefited the Indian consumers by suddenly permitting access to a wider range of sophisticated imported products assembled domestically But this is detrimental to the long term positioning of Indian firms in the global industry For what is involved is 'not mere production skills which are required but a range of skills, such as R and D, design and production engineering skills With an accumulation of these skills a company can respond adequately not only to internal problems of a technical nature, but also to the constantly changing environment

Their gloomy conclusion In our interpretation the new Indian policy framework is so far, associated with the generation of a set of firms and industries which stand very little chance of progressing from an infant to a mature stage in terms of both unit costs and technological change capabilities

Because this conclusion has such serious implications for Indian industry, and supports a view quite prevalent in Indian scientific and R and D circles, the book must be read by those interested in the prospects of Indian industry It cannot be ignored because it has made its arguments based on painstaking micro level case studies, and not on ideological or nationalistic appeals Its conclusions will not please any particular interest group for it does not argue for blanket protectionism. It does not say that liberalisation is bad *per se* in fact quite the contrary What its findings call for is a strategic restructuring of industry, in a manner so as to build up competitive capacity via technological competence It calls for greater specialisation by Indian firms, and their exposure to international competition particularly in export markets The book maintains a distance from the burning issue of privatisation and makes no particular case for the public or the private sector Nor does it advocate an explicit stance on foreign direct investment

What about Korea? In this case the liberalisation phase began in the 1980s Prior to that the chief aim of policy was to establish production facilities and fast growth under protective conditions, though export orientation of some key engineering industries was always there The liberalisation phase laid great emphasis on the development of an adequate technology base Policies directed to this end included a national R and D programme R and D subsidies tax deductions for manpower development and preferential capital for investment in new technology These policies were crucial and the book argues that they have been successful Korean firms in the industries studied, while not yet full members of the relevant strategic groups, are well on the way Korean technology efforts during the liberalisation phase were reflected in dramatic increases in such as parameters as the share of R and D expenditure in GNP (which more than trebled between 1980 and 1990), in the share of private sector in total R and D spending (which rose to as high as 84 per cent from 48 per cent in the same period) and in the total number of researchers which almost quadrupled) Small wonder then that there was a decline in the propensity to use foreign licences, and foreign technology payments rose slower than R and D The authors conclude

It is thus clear that the Korean industry has taken some very large steps towards improving its technological base Judging from the micro studies and the aggregate statistics the reorientation of policy in Korea seems to have been successful (although the change in firm behaviour is not only due to liberalisation)' The contrast with India is quite obvious where the erosion of R and D capability particularly for product development and the growing dominance of foreign technology collaboration is the pattern

What made the Korean effort successful? The authors point to several factors They emphasise that the Korean firms in spite of protection were always compelled to have an international mindset perceiving themselves as part of the global industry The ambitious ones wished to become exporters and laid emphasis on in house product designing They also were able to

concentrate their engineering skills on fewer products, using the international trade route more effectively to balance domestic demands and cost effectiveness, without compromising on technological capacity building They also characterise the Korean policy intervention as 'enabling', in contrast to the Indian 'restrictive' policy framework This refers to the creation of resources to support firms, steps to improve their risk taking ability, and helping shape their vision as international competitors There was also greater selectivity in Korean intervention with respect to protection When the Koreans shifted their policy stance towards greater competition from imports the resulting competitive pressure had a salutary effect on their willingness and ability to export

Why is it that competition from imports had the desired effect (unlike India) of moving Korean firms in the direction of acquiring greater international competitive capacity? Here Jacobsson and Alam make the following important observation which succinctly sums up the key argument of their book it needs to be emphasised that import liberalisation can only have a positive effect if there has been a prior building up of firms with resources of the type and character which make the entry into a chosen strategic group in the international industry seem to be within reach of the firms That is the response capacity of the firms and industries to a trade liberalisation depends on their previous learning experience A trade liberalisation must be preceded by policies which are designed to support the learning process

The major lesson which can be learned from East Asia Japan and South Korea in particular relates precisely to this aspect of learning in their industrialisation Their remarkable performance has stimulated a vibrant literature Some authors have placed this particular feature of 'learning' at the very core of their interpretation of Korean growth as the foundation of their success For example in Alice Amsden's well known book (*Asia's Next Giant South Korea and Late Industrialisation*) the first chapter is entitled Industrialising through Learning and the last chapter 'From Learner to Teacher At the same time there has been much discussion of why India has failed to impress A critical failure of the Indian model of industrialisation (according to Sukhamoy Chakravarty's *Development Planning The Indian Experience*) was India's failure to learn It is important to understand why this disparity has occurred in the two countries which appeared on the surface to share a similar mix of state intervention and market processes Thus this book addresses a very central and relevant issue It is a welcome addition to that stream of the literature, which argues for a pragmatic and non ideological approach to liberalisation According to Jacobsson and Alam, "trade liberalisation is but one step in a long process of fostering infant industries" And to conceive and carry through these policies there has to be adequate administrative capacity

We have dealt at length with the relevance of the themes dealt with in this book, and the significance of its findings for India We shall conclude this review with an assessment of the book's main strengths and weaknesses The major strength of the book lies in the micro-level case comparative studies of similar industries in India and Korea In each case, the authors analyse by turn the salient features of the global industrial structure and its strategies groups followed by an analysis of the structure strategic orientation, and relevant policies affecting that industry in the two countries This is a very painstaking and time consuming task, but it is essential to give this type of empirical grounding to the liberalisation debate It certainly deepens the reader's understanding of the divergent industrial and technological trajectories of the two countries in a concrete way This constitutes the main reason why the book ought to be read

There are however certain weaknesses to which attention should be drawn The book comprises of 10 chapters grouped into four parts The first two parts are devoted to the Introduction and a general discussion of government policy for the Korean and Indian engineering industries Part 3 is the heart of the book consisting of a mirco level analysis of four infant industries in Korea and India The concluding Part 4 is made up of generalisations synthesis and policy conclusions. Stylistically, the book reads like a penultimate draft It conveys an uneasy impression that some 'overview chapters' have been grafted on to the core micro-case studies The theory and the empirical treatment are not fully integrated, and as a result the empirical discussion sometimes ends up seeming descriptive For example, the assignment of different firms to the different strategic groups sometimes appears to be based on anecdotal evidence The reader might feel more convinced if there were some rigorous testing of the conformity of firm behaviour with the generic strategic type Part 2 is the weakest segment of the book Here the authors try to provide readers a broad overview of the evolution of Korean and Indian industrial policies This discussion is very sketchy, and not too illuminating Another weakness (in Part 1) is the book's inability to take adequate note of the more recent literature on the role of the state in east Asian industrialisation, of which lately there has been quite a spurt It therefore fails to situate its findings in the literature of which it forms a part namely the literature on the institutional approach to comparative advantage Finally in relation to relevance of the empirical material for the current debate on Indian liberalisation, it should be mentioned that the case studies refer to the 1980s Given the fast changing policy structures in the 1990s this is a drawback for a book published in 1994 on such a topical subject This may give an excuse (to those who would disagree with its main premises) to disregard the book's recommendations

To sum up, this is a book worth reading for readers who are interested in industrial and technological policy and who do not believe that liberalisation should stop at decontrol It should stimulate researchers to undertake similar in depth micro studies of industries situating them in the global strategic context

ADMINISTRATIVE OFFICER

Negotiating Within Patriarchy

Susan Visvanathan

Women as Subjects edited by Nita Kumar, Stree and Book Review Literary Trust, New Delhi 1994, Rs 150

WOMEN AS SUBJECTS is a non controversial book on the question of gender analyses in Indian ethnography The lack of polemic makes for safe almost familial reading Nothing in it could ruffle functionalist sociologists with pre conceived notions about the biases of feminism and its impact on value neutral sociology Women's Studies clearly is here to stay This book is about the stability and order of patriarchal systems and how women have been able to negotiate within it find positions of power and privilege complementary to masculine structures The first essay by Ann Gold and the last essay by Nita Kumar are somewhat different however from the other essays

Gold's essay shows how women's power is expressed through shakti but constantly controlled by men It shows that in some contexts women have been able to subvert masculine discourse by being sword wielding themselves The section Hadi Rani Beheads Herself' expresses the finality of women's protest When her husband defers going to war till the morning out of his desire for her Hadi Rani chastises him He asks her for a remembrance of her fidelity, she sends him her head Yet what is it for but to support masculine concepts of valour and war?

Progeneity and aggression the archetypical symbols of feminism making their entry into the classroom in India! By beginning with the strong and violent myths of Hindu sexuality the radical tones of feminist theory seem to be asserted Not just heads but genitals fly about and yes the conclusion remains that of male domination male-power male assertion The last essay by Nita Kumar is also in this mode although quieter It looks at the way in which Agarwal education for women in Benares establishes the non existence of women's voices in pedagogic records Both Gold and Kumar's essays are reminders that Women's Studies must continue looking at wounds if the journey is to continue It is not going to be easy after all one must have a vocation to delve into pain or what someone called a preoccupation with menstrual blood, sweat and tears Neutrality and dissection are extremely ambiguous terms in social science Both essays one by being flagrantly exotic erotic and the other by going into the most mundane notes on women's education make this point very clearly They are not activist, but in the Weberian sense their biases are clearly stated

The other essays in the volume assert the contribution gender studies make to a holistic sociology After all there is no doubt that whether it was caste or village studies, whether it was about hierarchy or landownership, masculinist terms of discourse operated Since women were invisible anyway, it contributed to the seeming objectivity of analyses It is only very slowly that some inroads have been made into breaking down the conventional conceptual hierarchies of sociology in and about India

It is this subjecthood of women that the essays in the book attempt to upset Gloria Raheja analyses the language of proverbs, songs and laughter of women in two villages in Uttar Pradesh She shows how patriarchal structures dominate, but women express the consciousness of subjugation through songs and proverbs of derision It is not subversion It is a finely tuned form of self consciousness and feminine awareness It takes away the violence of passivity or unthinking acceptance To say that 'we know and you know that what you do is about hierarchy and power' is to express an opinion That's what women have as a minimum option, and anthropologists have shown how often women find the space in which to articulate their experience of truth and emotion

Gail Minault has an essay on the swear words used between and amongst women in a 19th century Zenana The recorder of these insults are two Maulvis who take upon themselves to reform 'begamati zuban' Women, it would seem are the keepers of language and customs that the Maulanas feel are detrimental to purist interest Yet what Minault contributes is the sense of the laughter under situations of domination Separatist feminists may see a grave problem here but if feminism is not to be the mirror opposite of masculinism then Minault's essay and that of Patricia Jeffrey and Roger Jeffrey are of great significance

Jeffreys essay focuses on the Jats of Bijnor and considers the problems of literacy, autonomy and reproductive choices, including marriage and contraception They come up with the interesting comment that literacy doesn't always give women the advantage that reformers believe it must They cite their informants in some detail, and most of them say that whether a woman is educated or not, she is still relegated to the kitchen In an agrarian society, these women express their bondage to male kin fathers, husbands sons, and it seems as if they have no freedom at all To kill one's desires or thoughts seems to be the recurring theme here and the mode by which women survive in the complex situations of patriarchal joint family life The authors of the essay do provide alternative glimpses of women who've lost out on education and autonomy but believe their daughters will have a different destiny

William Sax shows how the songs of Garhwal represent Nandadevi in her many drunken, naked, warrior. Sax analyses this multiformity as corresponding to different points of the female life-cycle, where sexuality and danger become conjoined, and energies must be bound through sacred rituals and social conventions He handles the ambiguities of erotic and childless 'mother' goddesses with great ease and shows how myths and proverbs coalesce, and become the way in which men handle the complexity of their relationship with women William Sax represents the encounter between the two sexes as continually shifting, transitory and transformative This theme of the actual relationship between men and women certainly needs more careful handling and more detailed analysis by anthropologists Sax's contribution is significant because it shows how important a man's perspective on issue's concerning women is It is this dialogicity that will allow us the possibility of realising Marcel Mauss' dream of a total social fact'

Leslie Fleming handles the problem of women's liminality in some detail The essay looks at Cornelia Sorabji, an elite Indian Christian of Parsi origin She never married, but represented princely and high caste widows and orphans in litigation She did not challenge masculinist order outright 'but challenged men's abuse of women's rights within those structures thus achieving incremental changes for these women' Kripabai Sathianadan and Pandita Ramabai are also analysed by Fleming as two women who stood on the borders of the British and Indian worlds and negotiated carefully in the narrow passages that society allowed them

This book is useful because it has a certain theoretical tranquility about it No one needs to shout here to be heard – the point is made very correctly all the time It reminded me of Virginia Woolf's characters, many of whom describe their own lives with propriety and in pain while Woolf's political tracts and biography stand apart from the people she created Yet each of her characters is a symbol of the time, and makes sense of her life in the cabin spaces society provides Nita Kumar and her colleagues seem to be doing just this

The steadfastness of their position thus projects a certain quality of anthropological objectivity Women's perspectives, they seem to argue, is as valid a stance to look at reality from as Marxism or Functionalism Methodologically, then, women are not subjects in a disprivileged sense, they can become the definers of discourse More scholars, who are sure of their gender identity like William Sax and the novelist Peter Hoeg are necessary in the field, so that the discourse retains the multifacetedness which is the characteristic of sociology Gender studies cannot remain in a women's closet, and all theoreticians of inequality need to understand why a singer called Aurora on Music Television said "How is it women tend towards demographic majority all over the world but are treated under minority issues?"

Economic Reform and Ecological Refurbishment

A Strategy for India

J Mohan Rao

In a previous article the degraded state of India's environment was documented but the view that growth per se is the culprit was rejected. This article presents the case for an alternative economic strategy to SAP—needs oriented economic and ecological development or NFED which directs economic reforms to the fulfilment of basic needs, employment expansion and to a measure of environmental restoration and protection. Decentralisation and debureaucratisation of the public domain are advocated but class and regional inequalities are recognised as formidable obstacles.

IN an article published in a previous issue of this journal [1] we documented the broad contours of the degraded state of India's environment. Although degradation is doubtless related to the growth of economic activity and of population we rejected the view that growth *per se* is the culprit and its implication that growth must be halted. The flaw of the development model adopted in India arises not from its alleged thralldom to the so called western model but from its failure to produce economic growth suited to fulfilling the needs of the vast majority of Indians. The reckless resource intensity of growth and the social conflicts it has engendered are also ultimately related to this failure.

In this sequel we employ the analysis and results of the earlier article as the groundwork for examining alternative economic strategies. Since the crisis of 1991 the structural adjustment programme (SAP) adopted by the government has ushered in major changes in business as usual though none of these is explicitly aimed at environmental concerns. The first part of the following section the following is devoted to a brief consideration of these changes and their portents for India's ecology. The rest of the section constructs a case for an alternative to SAP - needs-oriented economic and ecological development or NEED – which directs economic reforms explicitly to the fulfilment of basic needs, employment expansion and to a measure of environmental restoration and protection. In addition to providing theoretical reasons for large areas of complementarity among economic growth (properly reckoned), equity and ecological refurbishment, we list priorities for environmental action for the coming two decades. The list is offered not as a blueprint but as a complement to the macroscopic and strategic focus of the paper.

Section II addresses critical opportunities and problems in the implementation of NEED. In joining the growing chorus of voices for effective decentralisation and debureaucratisation of the public domain (both politically and economically) we point out how NEED can exploit synergy in implementing programmes of employment creation, basic needs fulfilment and ecological reconstruction. At the same time it is noted that class and regional inequalities pose formidable obstacles to actually doing so. All the same, substantial devolution of powers to the people is advocated together with some elements of joint management, in terms of both authority and responsibility between decentralised institutions and state organs. Finally we briefly touch on the use that NEED can make of markets and prices. Market based instruments may be effectively used to finance redistributive transfers that NEED will require. In some important areas these can also be designed to cut down environmental degradation 'from above'. In yet others however such interventions if they are not outright counter productive to the goals of NFED may nonetheless produce difficult tradeoffs between social equity and efficient environmental restoration (or equity and growth).

Section III is a preliminary sketch of the macro-economic requirements and implications of NEED. Using a functional classification of economic activities into infrastructure, environment, non market basic needs, safety nets and a residual sector, we use the government's Eighth Plan document, in conjunction with assumptions that are more or less justified, to provide a rough estimate of currently planned outlays in both private and public domains for each of these sectors. This is followed by a reallocation of outlays to reflect (in very aggregative terms) the priorities of NEED. This allocation is also cross-classified organisationally into private, public and people's sectors to incorporate the proposed decentralisation of decisions and actions under NEED. We then draw out the main macro implications of NEED – for public finance, budgetary transfers, overall resource mobilisation and the external balance.

I
Needs-Oriented Economic and Ecological Development

In response to mounting internal and external debts and a massive payments crisis in 1991 the government of India initiated the structural adjustment programme (SAP). Although the reforms and even the crisis itself eventually came to be rationalised in terms of the growth constraint located in a dirigiste policy regime, this is hardly compatible with a decade of piecemeal reforms that preceded the crisis. At the very least, SAP implicitly acknowledges the unsustainability of growth achieved in the 1980s – unsustainable not in ecological but in fiscal and foreign exchange terms. The next section is devoted to an environment-oriented prognosis of the likely effects of SAP. The rest of the section constructs and defends NEED as an alternative strategy and considers institutional issues connected with its implementation.

SAP

Economic policy changes since 1991 undoubtedly mark a major attempt at redirecting India's economic fortunes. However, nothing in SAP suggests any explicit changes in environmental policies or regulations, many of which were instituted in the second half of the 1980s under pressure from the environmental movement. This does not imply, however, that it will remain business as usual so far as the environment is concerned. The impact on the environment is not invariant across policy regimes, nor will growth performance be independent of the environmental state. Trade and exchange liberalisation is the key driving force behind SAP. Since renewables are underpriced in the *status quo*, renewables-intensive production – forest products, some food and cash crops and many polluting industries – will gain from the hidden subsidies and likely show up as exports [Lele 1991] [2].

In meeting the export imperative much hope is reposed in liberalisation of

agricultural prices, trade and agro-exports including cereals, processed products of horticulture, and fish. If fulfilled, this is likely to produce a conflict with domestic needs for food, fibre and fish. Many states are in the process of reversing land ceiling laws to pave the way for the development of corporate farms, fisheries and plantations. Unless strict environmental regulations are adhered to and the growth confined to limited areas consistent with land use plans that place basic domestic requirements and people's livelihoods at the top, agri-business is likely to increase the strain on land- and water based rural production.

There is another object of trade reform – to induce efficiency in many moribund industries via competitive pressures. If successful then India may be able to export high technology and manufactured goods. This is not the place to evaluate the merits of this case.[3] But we can be certain that the pressures on many Indian industries to restructure will leave them with little patience for environmental niceties. Problems of non-compliance with standards will grow and the pollution control boards may find their limited enforcement capabilities sorely tested. As Taylor (1992) argues, there are serious conflicts between liberalised trade and environmental standards. India together with many other poor countries of the world may find dirty industries being added to its list of sectors (such as sweatshop manufactories) with 'comparative advantage'.

Timber is one area where liberalisation may swing things the other way. Import liberalisation produced a four fold rise in imports including pulpwood between 1986-87 and 1991 [World Bank 1993]. But we have already noted that with the right conservation and afforestation policies, India's forest yields could be raised. The more general point is that trade liberalisation must limit the possibilities of using trade policy as a pro-environment tool. It is one thing for an LDC to use trade to optimise its own environmental objective but quite another for it to accept the environmental implications of liberalised trade. SAP obliges planners to forego the one and to be resigned to the other.[4]

A second major thrust of SAP is deregulation, privatisation, knocking subsidies off and generally getting the state out of the economy. On the one hand, given the compulsions of India's political economy, much of this is as yet pious hope and, on the other, indistinguishable from mere fiscal belt tightening. On the third hand, for two do not suffice even if they should come to fruition and do wonders for growth, they do not bode well for the environment. First, it is most unlikely that pollution control and environmental restoration expenditures will rise above their present measly levels given a strategy wedded to trickle-down and maximising the profit incentive. Second, with the (much-needed) dismantling of licensing, the responsibility for pollution monitoring and control has been shifted largely to the wholly inadequate mechanisms of state and city governments as part of their physical planning mandate [Sivaramakrishnan 1993 volume 1]. Third, the unscrambling of subsidies is unlikely to release funds in ways that will hurt the rich and the powerful rather than the poor. Environmental deterioration from below may then get exacerbated.

The point just made brings us to the prospect for employment and basic needs fulfilment. Labour force growth, which slowed in the 1980s, will accelerate in the next decade or two. Although the withdrawal of children and young persons will continue, the share of the working-age population will rise and women's labour force participation will also rise [Government of India 1992a volume 1]. Even if formal sector growth should accelerate, the decade ahead will probably replicate the 'jobless growth' pattern (within the formal sector) of the 1980s on account of a shrinking public sector and a private sector undergoing restructuring. Employment will have to be generated essentially in the unorganised sector. With respect to this sector, the liberalising 1980s have seen two contrary trends. One is a quickened pace of employment growth in the small scale and informal sectors, partly aided by continuing labour market barriers in the formal sector and attendant sub-contracting. While this trend can be expected to continue, recent moves to dismantle directed credit with subsidies may well hurt the employment intensive small sector. Should the structure of industrial output shift on balance away from informal to formal enterprises, this would present an unpleasant tradeoff between employment and the environment.

In all, the environmental pluses of SAP appear dwarfed by the minuses. Even if growth expectations are realised, the employment picture looks murky at best. The subsistence and resource based economy of the poor will be left to its own devices (or worse). Any growth that manages to trickle down with customary state help is all there will be to lessen the backlog of unsatisfied basic needs. The growth optimists promise in the next couple of decades what might have been realised in the past four – raising the masses of India's poor at least to the level where their basic needs would be fulfilled. But in the familiar bargain favouring growth 'over development', both human welfare and environmental health have been sacrificed (and, some would say, growth itself has been lower than it might have been). Alternatives must be found that do not, once again, gamble at the expense of the poor. That way also lies the best hope for restoring the withering environment.

NEED

> The rich seem to be getting richer, the poor more marginalised. Development priorities appear to have been reversed. The philosophy of first things first or antyodaya – the principle of addressing the last person first – appears to be standing on its head. This is the ultimate negation of Gandhi and all that he symbolises [Jain 1987 21].

Whatever view one may take of Gandhi's moral philosophy concerning the limited standing that material consumption ought to have in human well being, at the present juncture in India a powerful case can be made for an economic strategy that is Gandhian in spirit without necessarily affirming 'Gandhi and all that he symbolises'. The strategy will accord the highest priority to (a) the fulfilment of basic needs, (b) the creation of employment that will be virtually guaranteed as an individual right, and (c) the enlistment of people's efforts in refurbishing the environment. Such a strategy, we wish to argue, makes good economic and environmental sense over and above its ethical appeal. We may call this 'instrumental Gandhism' and choose to distinguish it from 'philosophical Gandhism'. But given the multifarious connotations[5] that Gandhi's name evokes, it is simpler to call it 'NEED' (needs oriented economic and ecological development).[6]

NEED is centred on the inter-related goals of basic needs (BN), employment and environmental restoration. Its ethical justification may be founded on 'antyodaya' or equivalently on Rawls' *maximin* principle. Whereas achieving a significant measure of social equity will be a *sine qua non* of NEED, economic growth may be its fallout, not its prime mover.[7] Nevertheless, NEED envisages institutional and policy changes in favour of equity and environmental restoration, not just as marginal correctives of market inefficiencies but as critical inputs for growth itself. Its economic justification is based on the belief that combining BN and environmental restoration rather than pushing economic growth is the low cost route to both – costs reckoned not only in terms of investment and foreign exchange but also in terms of uncertainty, irreversibilities and uncertainties attached to economy-environment interactions favour prudence. Operationally, this means minimising the time required for the demographic transition on the one hand and for meeting basic human needs on the other.[8]

BN may be classified in terms of the mode of production and/or distribution of the relevant goods and services – market, individual subsistence activities and public/collective provision. A somewhat different categorisation, the one adopted here, is in terms of private goods (food, fuel, clothing, housing), quasi-public goods (drinking water, sanitation, health, education, land for

housing) and public goods (clean air) Quasi-public goods, though not public goods in the Samuelsonian sense, are subject to significant scale economies, externalities and transaction costs that typically require, especially in a poor economy, that their provision and management are in the public domain We should note in passing that BN standards – certainly for housing but even for nutrition - are not easily defined ' This is not, however, an insuperable obstacle

Though we treat employment and environment together with BN as the goals many would argue that only BN constitutes human welfare, employment and environment being merely instruments for furthering welfare This is of course debatable but that is not the tack we wish to take Rather, we believe (i) that employment is critical more so in a poor capitalist economy where a social wage is all but absent than in a rich one to the acquisition of purchasing power for meeting BN satisfied by private goods and (ii) there is a high degree of complementarity in both policy design and implementation between BN provision and environmental restoration Choices and actions under NEED must be governed by minimising costs for set standards By far the most difficult part in elaborating these is the setting of environmental standards – a task that we address in this paper in only the broadest terms

Complementarity

We begin by noting the direct links of complementarity and then address the indirect ones Some BN are also defining elements of the environment Improved access to drinking water and sanitation constitute environmental improvements The satisfaction of these needs removes some of the most pernicious negative externalities on health and productivity Better land use planning in rural and especially urban areas designed to meet the land requirements of housing can similarly promote a healthy living environment and reduce slums Secure and low cost availability of fuels that are safe for health can similarly restrict encroachments on forests and commons

While some BN are best satisfied in the public domain an unemployed or underemployed person lacking sufficient income will soon find herself unable to satisfy some of her most pressing needs including food Even BN services rendered in the public domain such as schooling and health care require complementary private expenditures of time and money But the converse is also true, i e, a person whose BN are satisfied will be more employable and more productive as a worker healthy and educated people also generate health and knowledge externalities for others

NEED also offers about the best chance for the steady and rapid expansion of employment opportunities This is especially so at the present juncture when industrial and trade reforms otherwise necessary for efficiency and fiscal savings are likely to diminish job growth Massive employment could be created through activities aimed at the restoration of the ecological infrastructure, including forests land, and water resources, through employment guarantee schemes [10] This will have multiplier effects on employment and incomes particularly if the poor have the right to use the assets created [van der Hoeven 1992] [1]

Reduced population growth is an important vehicle for complementarity within NEED Following the discussion in the previous paper we assume that it is desirable to limit the growth of numbers chiefly for ecological reasons This will also ease the required rate of growth of job creation As per the Eighth Plan's long-term projections [11] population is expected to be about 1208 million in 2 013 or 1 38 times its present size of 876 million at an annual growth rate of 1 62 per cent (Table 1) The plan also anticipates the economy to grow under an SAP initiated trajectory at about 5 62 per cent per annum to about 2 98 times its present size

The Eighth Plan projections are already premised on the assumption of unprecedented future success in achieving population control In fact comparison shows that India is projected to enjoy the same growth rate that Kerala had during the past two decades Kerala's annual rate of population growth was 1 92 per cent in the 1970s and 1 28 per cent in the 1980s or an average rate of 1 60 per cent for the 20 year period only slightly lower than the projected rate for India as a whole

We do not doubt that Kerala's population trajectory could be replicated by the rest of India over the next two decades What we find implausible is that it could be done with business as usual Kerala spends over half its budget on education and health Elsewhere the dysfunctional devotion to the family planning component has had a catastrophic effect on healthcare [Antia 1992 44] Unless expenditure priorities in the problem states and at the centre are changed substantially, the replication of Kerala's experience must remain out of reach An increased total and altered composition of expenditures in the social sectors will be needed because infant mortality, female literacy and job opportunities for women are the crucial determinants of birth rates The fact that the effective demand for reproductive control is significantly lower among the rural and below poverty groups also points in the same direction Thus the aforementioned population projections could/would be supported by the reorientation of policies and expenditures envisaged under NEED

With business as usual and population growing at, say 2 0 per cent annually, the 2013 population will be 1302 million or nearly a 100 million larger than the NEED-based' projection This is not a small difference from the viewpoint of reducing pressures on the environment especially as much of the difference will be concentrated in the states which are presently suffering from low human development indicators as well as severe ecological problems

Pro-environment and pro equity (including BN) policies are often feared to

detract from economic growth. This issue needs to be considered at two levels. The first concerns proper accounting. Conventional national income accounting counts pollution abatement expenditures as part of GNP and makes no allowance for the depreciation of unpriced natural capital or the cost of unmitigated pollution. Likewise, it weighs each rupee equally regardless of who receives it or what it is spent on. Even supposing that NLLD will reduce growth as conventionally measured, this need not imply a reduction in welfare as measured by income properly adjusted.

At the second level we must confront the growth implications (as conventionally measured) of NEED. Other things (equity, BN, natural capital) remaining the same, we argued earlier that income growth is broadly desirable both for raising consumption and to improve the environment. It is time now to look at the growth environment links more closely.

Traditionally the optimal growth problem with a labour surplus has been analysed on the twin premises that employed workers must be paid an institutionally set wage and that wages are wholly consumed. Under these conditions the saving rate cannot be directly optimised (through fiscal policy for example) and the capital labour ratio emerges as the control instrument [Marglin 1976]. Given the stock of (physical) capital, increased current employment or labour intensity reduces saving and growth. Depending on the discount rate, the social optimum requires current employment and output to be raised above the market level (to favour the present) and reduced below the unconstrained level (to favour the future).

A parallel formulation of the debate over sustainable development is possible. First assume that output is determined by labour and stocks of physical and (renewable) natural capital. Second suppose that difficulties in directly policing the environment preclude the first best optimum. Then restraining current output may be necessary to limit the resource intensity of production, i.e. to let natural capital renew itself. The lower the social discount rate, the lower must current output be, at the constrained optimum.

Neither formulation is adequate to the present discussion. The first one ignores natural and human capital formation while the second ignores unemployment and human capital. Observe first that the addition of human capital (or BN broadly) that is undersupplied by the market effectively places a premium in the first model, on current consumption as conventionally measured in national accounts (provided it is of the right sort and in the right hands). Even without the complications of natural capital, this is the basis for promoting BN. Second, if such human capital is complementary to natural capital, a similar premium arises in the second model as well. Third, the premium on human capital (or current output) in the second model is raised further if there is unemployment, and additional employment adds to the fulfilment of BN. Fourth, if increased BN fulfilment reduces unemployment by reducing the growth of population, this raises the premium still further. In short the unified model with the stated assumptions favours the promotion of basic needs and employment in order to (1) directly increase productive capacity and (2) indirectly protect natural capital from inadequate regeneration. On these grounds, it may be argued that NEED is the valid policy even if growth is the goal.

That the market undersupplies (certain kinds of) human capital and that reduced unemployment augments human capital are not assumptions open to doubt in poor countries. In a previous section we have argued also that increased BN fulfilment reduces population growth. But why should human capital and natural capital be assumed to be complementary? The main justification is as follows. When people (the poor or unemployed) have little access to the capital available in the organised or market economy, they meet their most basic needs as best they can through (more or less unpoliced) subsistence activities.

> The poor live within a biomass based subsistence economy all their fundamental needs (food, fodder, fuel, firewood, cowdung, crop wastes, fertilisers – dung/manure, leaf litter, building materials, timber, thatch and herbal medicines) are collected (*often freely*) from the immediate environment. To these may be added water which though not a biomass itself is biomass related and crucial for survival. (CSE 1985, emphasis added)

To be sure, this need not, in and of itself, destroy natural regeneration. We have seen how the growth of population, the enclosure and expropriation of the resources of the poor under the combined onslaught of technology and the organised market economy, and the breakdown of traditional community – in brief, the marginalisation of the poor – renders their self-provisioning activities destructive of natural capital. So long as these conditions continue to marginalise them, natural capital must degenerate. Conversely, when their needs are met by the organised economy so that physical capital substitutes for (at least some) natural capital, the degeneration is reduced if not halted.

Our argument is not that meeting BN through the organised economy is not destructive of natural capital. This may or may not be the case as argued earlier much depends on institutions, policies and the wealth distribution whose influence is only visible when 'natural capital' is disaggregated. Our argument is simply that under certain institutional conditions subsistence becomes differentially more destructive (or less constructive) of the natural environment than the organised economy. The differential is to be explained not only by differences in production technologies (higher intensity of physical capital and scale economies in the use of natural capital in the organised sector) between the two modes but also by differences in policing technologies.[13] Nor should our argument be construed to imply a purely technology based solution. The rehabilitation of marginalised people will have to confront the very institutions and property relations that have marginalised them.

*PC GNP is taken to be $300

Source: Based on data in World Bank (1992) and Jayawardena (1991).

Finally, we must explain why we consider equity to be a sine *qua non* of NEED For one thing, NEED will require additional fiscal or other ways of using the income of the rich to pay for redistributive tfansfers and to finance the public domain For another, our analysis is consistent with understanding degradation 'from below', in Myrdallian terms as the 'backwash' effects of inequitable growth whose spread is narrowly limited Equitable growth will be necessary to establish a more efficient margin between forced degradation from below and wanton degradation from above by arresting these backwash effects Furthering equity in the present is critical to fostering equity between the present and the future In the medium term, equitable growth is green growth, in the long term, this can also mean a higher rate of sustained growth

Priorities

Taking our preceding analyses of both environmental experience and strategic alternatives as a basis, this section suggests a list of priority environmental actions for the coming two decades The list is, for the most part, qualitative in character Available evidence on the investment and operating costs of various actions, their employment potentials and efficacy in terms of environmental indicators is skeletal and fragmentary Nor are there extensive studies of the health and productivity benefits of various pollution abatement and resource regeneration options While effluent and emission standards for various industries or sources are around they do not add up to standards for water or air quality Natural resource accounting has barely made a beginning in India [see IGIDR 1992]

The list of environmental priorities that follows, supplemented by BN priorities, is offered not as a blueprint but as a complement to the central analysis of the paper which is strategic and macroscopic It is fairly close to the itemisation in a statement prepared for UNCED [Government of India 1992b]

Employment + Basic Needs	food, clothing, housing, health, education, land for housing fuel drinking water, sanitation clean air
Environment	population biomass and forest regeneration soil-water conservation and agriculture irrigation and flood control urban habitats energy options

Environmental priorities listed above merit more detail which is provided in the rest of this section leaving the discussion of investment allocations for a later section

(i) *Population*

Although listed as a 'high priority', population control will be a fallout of NEED rather than a major area for public expenditure, at any rate, nowhere on the scale proposed by the World Bank (1992) or by WIDER [see Jayawardena 1991] [14]

(ii) *Biomas and Forest Regeneration*

A realistic target for the forest area in 2013 as a share of total area would be 30 per cent or 100 mh, which implies afforestation of 36 mh over a 20 year period Of this 26 mh can come from wastelands already recorded as forest areas, the remaining 10 mh could come from afforesting a quarter of all presently unproductive non-forest areas Forest growth at about 2 2 per cent per annum will not be much above the expected growth rate of population after allowance is made for conservation forestry While non fuelwood demand is bound to grow faster than this, this should still leave enough room to meet most demands including fuelwood needs Nonetheless with technical inputs and better management, there is considerable potential for raising forest yields With such efforts, it would become possible for India to have a stable forest cover and yet have a surplus of timber for export

Provided the growth of the cattle population can be kept at or (ideally) below past rates the growth of agricultural residues can be made to bear an even larger share of the burden of fodder demands than they presently do With local efforts at rehabilitating grazing commons, it would appear that the fodder requirements of the country can be adequately met while, at the same time, containing grazing pressures on forest areas

In one sense, the arithmetic above is misleading Fodder fuelwood and biomass generally are not notably tradeable goods Hence, the key difficulty will be growing biotic pressure in the more backward agro-climatic regions Great migrations are probably not on the cards Hence land-based production in these regions are going to need substantial public expenditures and subsidies to support the required growth

(iii) *Soil Water Conservation and Agriculture*

The immense problem of soil erosion and land degradation must be attacked with both curative and preventive measures If all of the degraded agricultural land (85 mh) is targeted for refurbishment the annual recovery rate works out to about four mh a year On grounds of efficiency, it would be proper to first target the water logged (six mh) and saline lands (seven mh) in irrigated areas where the returns to reclamation will be highest

On the preventive side, protective and productive combinations of soil and water conservation efforts are called for Micro watersheds for the more fragile and water stressed soils of the semi arid regions will have to be a top priority Watersheds in flood prone areas and soil conservation in upper catchments are also needed to reduce damage by floods and the silt load in rivers Afforestation everywhere will be a necessary part of these efforts

There is no viable alternative if food needs are to be met, to the current model of high input agriculture But Indian land yields remain very low by world standards relative to non land inputs Efficiency in the use of water and other inputs will become increasingly necessary to ensure sustained growth in the irrigated regions such gains

SCIENCE, TECHNOLOGY AND SOCIETY

An International Journal Devoted to the Developing World

Edited by **V V Krishna** *National Institute of Science, Technology and Development* and **Roland Waast** *ORSTOM, Paris*

The study of the interface between science technology and society is a broad, multidisciplinary field of enquiry which enhances our understanding of the way in which advances in science and technology influence society and vice versa *Science Technology and Society* will be the first truly international journal devoted to the developing world and published from the region

The Journal

- will eschew a partisan approach whether of an academic or political nature while not fighting shy of controversy
- will publish analytical and empirical articles from a variety of disciplines and relating to all developing countries
- will cover areas including • History • Sociology • Philosophy • Economics • Political Science • Psychology • Technological Forecasting • Science Policy • R&D Management • Health and Nutrition • Ecology and Environment • Agriculture • Quantitative Studies
- will promote interdisciplinary perspectives drawing upon a number of hard core science disciplines
- will be particularly relevant for understanding the interface between science technology and development policies as applied to developing nations

Problem of Muslim Women in India

Rs 250 00 HB

Asghar Ali Engineer (Ed)

This book provides a critical survey of the status of Muslim women and the problems affecting them It is a compilation of articles, attempting to cover the entire gamut of problems -- child marriage, polygamy, divorce, inheritance, illiteracy and socio-economic status The contributors many of whom are social activists and academicians, have systematically analysed the issues and tried to identify the stumbling blocks in the way of progress *The Hindu*

Lifting the veil

Communal Violence and Communal Harmony in Contemporary India
Asghar Ali Engineer

Publishers **Sangam Books (India) Ltd**
Distributors **Orient Longman Ltd.**

This book attacks the growing spectra of fundamentalism in modern Indian and its manifestation in communal reaction and violence

Engineer concedes theocratic and political differences between the Hindus and Muslims but feels that religious issues are embittered by economic competition

The first part of the book places Indian communalism in its historical perspective and probes the link between violent ethnic conflict and development its second part elaborates on the Ramjanmabhoomi-Babri masjid issue and the communalisation of the Indian Polity *The Telegraph*

Orient Longman

Orient Longman Limited, 3 6 272 Himayatnagar, Hyderabad 500 029

will also help reduce the harmful (soil erosion, water pollution) effects of modern monocropping Research will have to particularly focus on ways of raising the low yields in the rainfed regions Shifting over to a less water-intensive production mix (away from rice and wheat and towards coarse cereals and pulses) can conserve water and enhance nutrition substantially Biotechnology research for Indian conditions must assume a high priority in national research programmes – for example, genes resistant to water-stress will produce far higher returns (besides generating employment) than genes that will be weed resistant (which will reduce employment)

(iv) *Irrigation and Flood Control*

The non engineering elements of large dam projects can no longer be ignored or under funded Procedures and criteria in rehabilitation and resettlement programmes as well as all other planning aspects should be open to public scrutiny Soil conservation in the catchments is essential to stem the decline in the useful life of reservoirs Similarly command area development must be fully funded to ensure efficient use of soil and water Soil water conservation investments may actually raise the benefit/cost ratio of water projects [Khoshoo 1987] contrary to the fears of engineers

All things considered a tilt in favour of minor irrigation would best serve the country's interests with large dams being confined over the next decade or so to those areas where no other alternative exists A related reorientation of priorities would be in favour of micro watershed development projects and smaller hydel projects These should help postpone the day when large dams will once again become necessary Since nearly two thirds of groundwater resources are yet to be exploited, there is urgent need for major reforms in the management regime

(v) *Urban Habitats*

The country will have to make use of cost saving technologies in responding to the basic problems of drinking water supply and sanitation – deepwell handpumps rather than piped water supply [Srivastava 1990] pour flush toilets rather than conventional sewerage in smaller urban centres [Sivaramakrishnan 1993], common toilets and pit latrines in rural areas [Carr Harris 1992]

Control of water pollution, particularly in urban areas, will require major efforts Sewerage is by far the major pollutant of water But by 2000, a third of urban waste water will be industrial with a much higher load of BOD [Khoshoo 1987 115] Besides enforcing the minimum national standards, special water treatment efforts will be needed for thermal plants, distilleries, paper mills and hazardous chemicals industries A parallel set of efforts is needed in respect of air pollution The urban transport mix must be shifted steadily in favour of public modes both to save fuel and cut down pollution and congestion At least for the major cities overall air quality standards must be set and implemented

(vi) *Energy Options*

On the energy front, a battery of options to save energy, substitute more polluting with less polluting fuels, and end-use technologies that help on both counts are available Ways and means will have to be found to implement them in a phased manner so as to achieve energy efficiency and pollution abatement

Alternatives to biomass fuels will remain infeasible for some time to come, particularly in rural India The key here is to accommodate biomass fuel demands in ways that will reduce the terrible costs of both on-site (indoor pollution) and off site (deforestation, soil erosion etc) damage Wherever feasible in terms of input availability, biogas and high efficiency fuelwood stoves appear to be desirable on both economic and ecological grounds Households must be encouraged to shift from kerosene to electricity for lighting, which will then pave the way to induce a shift of freight composition from road to rail For urban areas LPG electricity, piped sewage gas and soft coke/coal are options that can help save fuelwood [Goldemberg et al 1988] A shift to methanol (which may be produced with the fuelwood saved) as fuel for trucks and buses would also help cut down total diesel demand Finally decentralised energy sources (small hydel biogas and producer gas) cost less than centralised sources (nuclear, thermal and hydel), and conservation options are cheaper than generation options [Reddy et al 1990]

II
NEED: Implementation

NEED will be the cost-minimising route to its chosen objectives only if the modes of implementation are appropriately chosen In particular, NEED must be based on exploiting the complementarity among instruments of implementation, i e, communities, states and markets This will require recasting property relations, changing governance mechanisms, devolving public finance and implementation responsibility to lower levels in the public domain, and a creative use of market-based instruments (MBI) There is already a growing demand in the country for effective decentralisation and debureaucratisation of the state machinery (both politically and economically). This presents both opportunities for NEED and some challenges It is to these that we now turn

Communities

By excluding people from the mainstream of the development process, the environment must inevitably get marginalised This process which has been underway for a long time will require people's involvement to be reversed This can only be accomplished with decentralisation of the public domain and its de-bureaucratisation Creating self-management structures at the community level (primarily the villages but also users' groups and citizens' councils especially on a locality basis in urban centres) will be the key to the first and breaking down various aspects of state monopoly (in ownership of forests, in regulation of farmers trading timber, in delivery of education or health services) to the second

Several considerations argue powerfully in favour of decentralised decision-making, not just implementation First, some of the more important problems relating to the environment in India such as land, biomass, water and even forests are localised Therefore, relevant knowledge is often local Second, preferences over basic needs, natural resources and infrastructure also tend to be quite varied locally [15] Third, though environmental services, employment provision and BN goods/services all have a significant public goods or quasi-public goods character to them, self-management can harness people's own incentives to meeting them efficiently Finally, decentralisation can promote participation activating local democracy and public spiritedness

Biomass undergirds the basic needs of the rural poor – food, fuel, agricultural inputs (manure and fodder), building materials and artisanal inputs To these must be added water which is crucial for raising agricultural crops Agarwal and Narain (1989) argue that water provides the best starting point in the restoration of the village eco-system Water harvesting systems not only help agricultural production, but their protection can be expected to generate participant enthusiasm 'Slowly one thing will lead to another and the village community will start managing its entire village ecosystem" (1989 vi)

The revival and rejuvenation of commons must be oriented to meeting primarily the above-mentioned subsistence needs A fundamental case for this option rather than pure privatisation is that the latter will not serve the goal of equity or of providing a minimum safety net in terms of biomass requirements It makes no sense to privatise village commons which, especially in the regions excluded by India's agricultural development strategy, have supported the

poor and the marginalised. In addition, there are no assurances at all that the market no less than the state will take care of biomass-driven poverty. As Agarwal and Narain point out, "it would be criminal to privatise the commons" (1989 vi). This is but an extreme example of the folly of pursuing neoclassical formalism while ignoring the substantive outcomes that markets produce.

Preserving CPRs as such will also ensure that scale economies in their use are not lost through privatisation. In practice too privatisation has led to underutilisation and low yields. There are huge amounts of wasteland in private hands particularly of big farmers which themselves need rejuvenation. Part of the crisis of biomass is traceable in fact to the privatisation of village commons through encroachment and state programmes [Nadkarni 1989].

Forest property is presently predominantly in the forest department's hands. The problem of forest resource management may be posed as a property reform which provides the best resolution of issues relating to knowledge, incentives and enforcement within the framework of NEED. The key here is that without local co-operation the difficulty of policing forests cannot be handled.

Conservation forestry must remain with the state both because it requires specialised knowledge and because there will be heavy costs attached to irreversible damage. The main thrust area will have to be social forestry once again to meet basic biomass needs while preserving the environmental functions of forests. The problem with government afforestation efforts has been the low returns due to low survival rates or planting of non-browseable plants such as eucalyptus and casuarina. Community forestry can address forest management problems more effectively by creating *quid pro quo* for the community.

The forest department's monopoly over forest lands (other than conservation land) must go. That is to say, social forestry's domain will extend beyond 'people's lands' to include state forest areas. But this still leaves open a critical question: should communities share forest management and output with the forest department (the Arabari model) or should they have absolute control over village forests (the Sukhomajri model) including the case where they pay a fixed fee to the state? The latter offers a greater stake to the people but it may be vulnerable to commercialisation. The Arabari model offers output sharing in exchange for protection and a constraint on over-exploitation through countervailing checks and balances. Moreover the forest departments can be expected to have an interest in providing much-needed technical services in forest management. The model lends itself equally well to afforestation proper as to natural regeneration [Bajaj 1992].

As far as industrial needs are concerned, options usually considered include imports, corporate plantations and farm forestry. There are problems with each of these. The first is not conducive to raising yields, the second will be iniquitous. Farm forestry also, as we have seen, has certain obstacles that it must overcome for its market to be viable, but there is no rationale for restrictive regulations by the state. However there is the distinct possibility of using joint (state-community) management not only for subsistence production of basic needs, as just discussed, but also industrial needs. This can produce cash income for the communities and regularise rather than ineffectually exclude the commercial element in 'subsistence' forestry.[16]

Decentralisation is not an idea to be confined to rural areas though admittedly the latter have a ready frame for such action. There is scope for expanding urban community development programmes both to take the load off of municipal boards and to provide intermediaries between citizens and the boards [Mohan 1992 293].

Persuasive as arguments for decentralisation are, there are two main objections to be dealt with. The first is localism or NIMBY (not in my-backyard) and the second pertains to inequality, local and inter-regional. Local diversity can be easily exaggerated at the expense of dealing with problems that require co-ordinated solutions beyond the local level. Examples include treatment of river basins and their catchments, habitat cleanup in larger urban agglomerations, mining, power plants, large irrigation projects. They can neither be planned at the purely local level nor delivered at that level. But even closer to home village level management of ecology must confront disputes with neighbouring villages. The poor state of land records makes this matter worse.

A troubling aspect of 'communities' has to do with their scale, heterogeneity and conflict. Conflict is endemic and co-operation exceptional. Working examples of community self management range from reviving an irrigation tank (Sukhomajri) to protecting adjacent forest lands (Chipko movement) to equitable distribution of harvested water (pani panchayats). But village settlements are often divided into caste hamlets. Panchayats (village governing bodies) are riven with factionalism and arouse the suspicion of poor villagers due to the dominance of the better off. On average, a panchayat covers 2.8 villages and 2,306 people [Agarwal and Narain 1989 20]. These problems of excessive size, inequities and factionalism limit the capabilities of communities. In fact, "in areas where levels of inequality are high, voluntary agencies have tried to form institutions which bring together only the poor households" (1989:24). All such efforts (organised by NGOs), in fact, have had to work outside the existing village panchayats.

Many examples have been analysed in this paper linking the failure of local co-operation with inequality. In the rural context, agricultural land remains the fundamental source of production, incomes and inequality of wealth. Land also provides privileged access to groundwater, surface water, credit and state power. These are all sources of major externalities in production and consumption.[17] Can local communities function in ways that will help internalise these? How is effective soil and water conservation to be arranged within the current property regime, bureaucratic programmes having failed? If neither the visible hand of the state regulating groundwater use nor a regulated invisible hand of price signals offers much by way of resolving problems of water exploitation, can communities offer a third way? Can communities whose CPR management systems eroded for reasons of socio-economic dynamics within them as much as external forces impinging from without – the law, state power, greedy contractors, new technologies – be now called upon to rebuild those systems?

These concerns and questions are real and cannot be evaded by paying mere lip-service to land reform. The call for decentralisation must be coupled with a demand for land reforms. Many, probably most, among the rural poor are marginalised because they own little or no land and have little or no access to credit. Without land reforms that provide much wider access to the basic means of production than prevails, reforming the commons alone will not rescue them from this marginalisation but merely shore up their precarious living with sops of biomass.

Optimists might argue that even if community self management is not a balanced solution, the imbalance will produce creative pressures that can be utilised. There is a case to be made that such decentralisation will itself set up such a dynamic. "Slowly one thing will lead to another" from coming together to solve one specific common problem to greater democratisation of village affairs and then on to more egalitarian property relations.

States

Environmental regeneration without state involvement is like Hamlet without the Prince of Denmark. The authority of the state is critical for financing investments in the public domain, for resolving disputes across communities or between polluters and pollutees, for devising and implementing MBI where these are appropriate and for promoting certain types of technology. Hence, getting the state out, which is the common refrain in virtually all other areas

of economic policy under SAP simply will not do But the issue in the Indian case is not whether the state needs to play a key role, the issue is whether this should conform to business as usual or undergo thorough-going reforms to improve performance

The state is needed to solve the problems of NIMBY – it may turn out that no village left to its own devices, would be willing to spare its commons or woodlands for biodiversity preservation, to plan for indivisible resources that cut across several villages or even states and to plan for infrastructure that is intimately connected to the environment (the power grid, national and state highways research and the like) Mere indicative planning cannot address these issues Taking care of the parts will not necessarily translate into a holistic solution Some actions or at least their enforcement, have to be global

Village level decentralisation will require clear demarcation of village boundaries to delimit separate village commons Specifically pinning down the legal status of various land areas will be the first order of business

The decentralisation of BN employment and ecology programmes will require a corresponding devolution of fiscal resources from the centre and states down to the village level While this in itself is a simple almost mechanical task inter village inequalities pose formidable obstacles to politically successful decentralisation Given large inequalities both within and among states adequate sharing formulae will have to be found and these resolutions will continue to take place in the state domain The funding process can also be used to establish some connections between the national or state level plan and the village plans through a system of matching funds for areas of priority set at the higher levels

In the past rural development and employment programmes as well as afforestation or soil conservation efforts have been hobbled by bureaucratic centralisation insufficient resources inability to diffuse over wide areas and incapacity to deliver quickly Only local involvement of communities can counter each of these failures Decentralisation is supposed to help resolve these problems But panchayati raj must be implemented in the 'two-tier and not the three-tier [model] based at the district level [Antia 1992 50] – gram panchayats and panchayat samitis yes, but zilla parishads no For example, Antia notes that 98 per cent of all curative, promotive and preventive health care is best undertaken at these two levels Personalised and humanised relations, health workers becoming part of or coming from the community itself increase in the budget share for medicines and supplies, administrative and financial control in the hands of the villagers themselves these prescriptions for health care suggest just how much the quality of 'state' involvement must improve and how much of it will have to be appropriated by the people themselves

Markets

Finally we briefly touch on the use that NEED can make of markets and prices Market-based instruments may be effectively used to finance redistributive transfers, e g in favour of village communities, that NEED will require In some important areas these can also be designed to cut down environmental degradation 'from above', e g differential taxes on transport modes In yet others however, such interventions if they are not outright counter-productive to the goals of NEED, may nonetheless produce difficult trade offs between social equity and efficient environmental restoration (or equity and growth)

The key constraint on the market is not that it cannot be made to adequately reflect social costs of resource use The greater difficulty lies in ensuring the equity of the resultant outcomes The poor should not and cannot be asked to pay for the full costs of schooling or health care, for example Similarly, equitable environmental policy is best achieved by making rich polluters pay and by subsidising poor polluters to refrain from their respective counter productive activities The latter sort of policy cannot be operationalised via market prices since the activities in question are outside the market arena (or at least well beyond the practicable reach of price interventions) one may say that the relevant environmental response elasticities to prices are zero Hence, institutional design and direct state interventions (as set out above) are the relevant choice variables

The typical neoclassical view is that complementary policies i e those that raise current economic welfare and reduce environmental degradation, are almost exclusively confined to pricing reforms and privatisation of resources [Repetto 1988 3] Apart from correcting anti-conservation misuse of resources such policies also have potentially large fiscal payoffs For reasons analysed in the preceding sections, we believe that such policies are for the most part, confined to what we have called 'degradation from above' However there is another distinct set of policy reforms that can exploit similar complementarity at the other end of the income hierarchy These will require added public expenditure and/or fiscal subsidies rather than getting the prices right A blanket call for the abolition of subsidies for all natural resources is mistakenly based on the supposition that all of the benefits of such subsidies are received by the wealthy and all of their costs paid for by the poor The distributive dimension is surely central to the issue of subsidies but it does not divide neatly along the wealth hierarchy

The World Bank (1992) argues that adoption of cost-reflecting prices would reduce economic costs by reducing resource wastes But the cost-based pricing of basic needs may be quite 'uneconomic' not only for conventional reasons, e g, educational or health externalities, but also because of the environmental externalities of leaving the poor out from a social safety net that includes minimum assurance of basic needs

With forests, grazing lands, fisheries and most water resources remaining in the public domain the tasks of the market are accordingly circumscribed Infrastructural services have long suffered from excess demand and financing constraints Both are traceable, in large measure, to low administered prices In such areas as power, transport and minerals, subsidies must be done away with but there still exists a strong case for differential pricing

(i) Differential taxes favouring public over private transport are both eco-friendly and equitable

(ii) Stiff urban land taxes (backed by an effective collection machinery) should be designed to make private developers pay for social overheads and for hidden externalities The measure is both market-friendly and eco friendly Receipts can finance habitat clean up, subsidised or zero-cost amenities, particularly for the urban poor and for more rational urban development

(iii) Subsidies given to fertilisers rural power and other inputs also need to be eliminated But this will create problems of regional equity (with late arriving states not having the benefit of the subsidies) which will have to be made up say, via differential investment subsidies

(iv) The rationalisation of diesel/kerosene pricing pre supposes supporting non-market or market actions to ensure that the poor do not suffer as a result, e g a one-time connection subsidy for home electrification

(v) In the case of irrigation, there are good reasons for the inability or inadvisability of pursuing marginal cost pricing producer-consumer equity the high variability of the productive value of water across space, seasons and crops, administrative of pricing and of varying supplies to match demands, small efficiency gains due to low elasticities and the need to minimise conflict and avoid free-ridership [Sampath 1992] Where water cannot be fairly and efficiently' priced a powerful case for taxing beneficiaries by means of taxes on their lands or on their market sales (through the existing procurment systems) exists This line of argument complements the long-standing but unimplemented proposal to tax agricultural holdings

III
NEED: Macro-Dimensions

With a focus on investment allocations suitable to NEED this section provides a sketch of the macroeconomic requirements and implications of NEED. Our purpose is not so much to specify an alternative plan or work out its macroeconomic consistency, as to provide broad indications and comparisons in relation to the Eighth Plan document which serves as a benchmark.

Framework

Specifically we identify the magnitude of investment reallocations across sectors that will be necessary to carry out NEED. To this end, sectors are cross classified by ownership/control into state, community and market sectors and by function into infrastructure, environment, non market BN, safety nets and a residual (all other) sector. This classification follows analytical requirement as much as data availability for the quick comparisons undertaken here.

The main comparison is between the proposed allocation under NEED and that under SAP (as contained in the government's Eighth Plan document). We also compare environment expenditure under SAP and under proposals made by the World Bank and by the World Institute for Development Economic Research (WIDER). The functional classification of outlays is based on the items listed in the Plan document.[18] Table 2 provides a consolidated picture based on the following.

(1) State outlays include both investment proper and current outlays of a recurring and non investment nature which is needed to initiate the accrual of benefits from the investment [Government of India 1992a: 43]. The recurring component is about a sixth of total state outlays and concentrated in the social sectors. Its inclusion may be rationalised on the ground that recurring social sector expenditures capture some portion at least of the 'investment' element in human capital expenditures that is ignored in conventional national income accounting.

(2) Infrastructure includes irrigation, energy, transport, communication and research. This list is complete for the state sector whereas for the private or market sector it is probably nearly so (omitting, for example, research and irrigation).

(3) Environment here includes expenditure under the head 'Ecology and Environment' in the plan. To this, we have added the following items: soil and water conservation, flood control and drainage, non-conventional energy, forestry and wildlife, family welfare and water supply and sanitation.

(4) Non market basic needs includes state sector outlays on rural development, nutrition, services, education, health, housing and urban development. Corresponding outlays in the market sector appear as part of the item 'all other'. Observe also that this list excludes key items of BN such as food and clothing.

(5) Safety Nets includes state sector outlays on rural employment, special area programmes, village and small industries and miscellaneous welfare services.[19]

(6) All other outlays include items not classified under the above four heads.

The above classification understates the planned investment expenditures on the environment to be undertaken in both private and public sectors. It certainly includes all state sector ear marked investments on environmental resources. But it excludes environmental expenditures undertaken as part of investment in other sectors such as infrastructure, industry, agriculture and mining, e.g. pollution abatement equipment, private soil conservation investment and the like. Rather than ignore these outlays altogether, we have made purely *ad hoc* allowances out of total reported investments in both state and market sectors on the following basis: transport (1 per cent), agriculture, mining and manufacturing (2 per cent), utilities (3 per cent) and irrigation (4 per cent).

Even these probably generous allowances amount to only about 16 per cent of the total outlay on the environment (Rs 6 393 crore out of Rs 39 906 crore) in the state sector. Of course these arbitrary assignments which amount to Rs 5 776 crore constitute the whole of environmental investment in the market sector. The grand total of these *ad hoc* assignments is only 26 6 per cent of the total consolidated expenditure on the environment. It would therefore seem that significant adjustments in the above allowances will not move the environmental total by very much.

Table 2 shows that environment outlays constitute 5 2 per cent of the total outlays, of which 87 per cent are in the state sector. As much as 31 7 per cent of all outlays are for infrastructure reflecting the infra structure intensive phase of growth in which the economy presently is. Only 11 3 per cent of outlays are for non-market basic needs and for safety nets. The total outlay divides evenly between the state and market sectors.

Allocation

With the cumulative GDP generated during the Eighth Plan period (1992-97) being placed at Rs 3 439,053 crore, the above noted estimate for environment-related investment expenditure during the plan period (Table 2) amounts to 1 33 per cent of GDP. By way of comparison, we may consider India's estimated share of environmental expenditures proposed by WIDER and the World Bank for all LDCs in the year 2000. Table 3 provides the details.

India's share of total LDC expenditures may be alternatively based on population, land area or GNP shares. We consider two schemes: the first, in which each of these bases is given equal weight, gives a 10 67 per cent share for India. If population alone is taken to be the relevant base, the share works out to 20 5 per cent. We believe that the normative share ought to be between these two numbers as neither land area as such nor GNP are exclusively relevant bases for such large environmental items as population control, water and sanitation or even agriculture and forestry. Table 3 shows that India will need to spend between 1 71 and 3 30 per cent of its GNP (in 2000 AD) on the environment under the Bank proposal, and between 2 and 3 86 per cent under the WIDER proposal.

Thus the government's proposed level of environmental outlays for the Eighth Plan is between 34 and 78 per cent of what it might be under the international proposals. Even allowing for some growth within the plan period (1992-97) and beyond (1997-2000) the government's outlay falls considerably short of the international norms. This is so despite our estimate of environmental expenditure under the plan being rather more comprehensive than either of the two international estimates.

Table 4 provides an alternative comparison of the Eighth Plan outlays (listed under the SAP row heads) against the proposed allocation under NEED with all figures being expressed relative to GDP. The proposals take the following factors into account.

Infrastructure: Food among the basic needs requires considerable investment in infrastructure such as irrigation, transport and power. Particularly for the rainfed regions, this will imply an increase in infrastructure investment above the SAP levels. In addition, habitat improvement in urban areas will also need additional infrastructural services. But the substantial reduction in all other outlays being proposed (see below) should more than compensate for these increments, the urban and middle class oriented weight of these expenditures makes them particularly demanding of energy and other investments. On balance the total allocation is left unchanged and so is its composition (which, under SAP, already allows for significant private sector participation). Any slack this leaves seems to be necessary to meet the backlog of pent-up infrastructural demands.

Environment: Basically, we propose a near-doubling of total environmental outlays from an estimated 1 3 per cent of GDP to 2 5 per cent. Of the additional 1 2 per cent, a sixth will be in the market sector and the remainder in the new communities sector. The state

sector outlay is left unchanged but given that several of the environmental programmes presently in that sector are to be decentralised to communities under the proposal, this does imply an increase in outlays for the higher-level programmes such as conservation forestry, pollution abatement in public sector industry and infrastructure, river basin clean up programmes etc

The desirable priorities and associated levels of expenditures will always remain difficult to work out, but this is especially so at the current juncture when studies of valuations of natural resource services are in their infancy Consider one case the valuation of forests An early estimate [Das 1980] of the value of environmental services rendered by a medium sized tree over 50 years amounted to Rs 1 57 million or assuming 100 such trees per hectare, Rs 157 million per hectare Maudgal (nd) reports a figure of Rs 7 7 million per hectare of forests submerged by the Narmada project Lal (1992) places the net present value (all services included) of a hectare of forests at Rs 2 12 million Finally Chaturvedi (1992) calculated the opportunity costs of 1 hectare of forests displaced in one particular location at Rs 0 032 million Be that as it may the SPWD (1991) has argued that at the funding rate of 1990 91 afforestation covers no more than 1 6 per cent of the degraded forest area This in turn, is only a quarter of the target we have suggested earlier in this paper which provides some perspective on the proposed doubling of the environment budget

The matter may also be viewed from the energy sector perspective The total outlay on non conventional energy plus forestry (including wildlife) is less than 5 per cent of the outlay on the commercial energy sector even though biomass accounts for 34 per cent of the total primary energy supply in the country

Basic Needs Here too the NEED allocation is twice as large as the SAP level Enlarged expenditures on health primary education nutrition and immunisation programmes for the young together with investments in employment creating CPRs and other rural development programmes are envisaged All of this increase plus a third of the SAP allocation currently in the state sector will be assigned to communities

In nutrition, India needs to move beyond 'phase I' of the transition (eradication of famines, reduced incidence of florid nutritional deficiency diseases and better child survival) to phase II requiring the optimal nutrition and growth of 'survivors' [Gopalan 1992] Some of the nutritional problems, such as zinc deficiency in rice areas, are directly related to environmental problems caused by prevalent production practices Current levels of health sector spending in India at 5 24 per cent of GDP is considered better than average for its income level However, India "gets a poor return in terms of health improvement" [Berman and Dave 1992 341] because much of the spending is misdirected in favour of curative rather than preventive measures two-thirds of the total being in the private sector and 54 per cent of state spending being in the urban areas

Safety Nets With the above measures to raise levels of spending and their composition in the areas of environment and basic needs in place there will have been created considerable room for the consolidation and rationalisation of existing employment and special areas/needs programmes under those heads The proposals taken together will allow the integration of various employment and anti poverty programmes with the sectoral programmes specific to various areas This will serve to exploit the synergy in implementation of efforts to generate employment build infrastructure and rejuvenate environmental assets It is therefore proposed to prune state outlays on safety nets by as much as a half Overall outlays however will fall only by a seventh as much of the saving is proposed to be channelled as human capital investment and employment generation programmes (training technical services credit subsidies) for the small scale and informal sectors which are listed under the market economy

All Other State investments in this category will be cut by 20 per cent This is also consistent with SAP proposals to privatise some state industries and retrench in many others A proportionate cut is proposed under this heading for the market sector as well which incidentally provides the largest balancing item to support the overall thrust of NEED It also defines the key role of equity in the NEED package

Implications

Our proposals add up to the following functionally a doubling of investments for employment oriented basic needs fulfilment and environmental restoration balanced by a 20 per cent cut in investments that by and large meet the wants of the top few deciles of the income hierarchy sectorally a redirection of 12 per cent of total investment outlays to decentralised communities compensated by a 13 per cent scaling back of the state sector and an 11 per cent shrinkage of the market sector

Macroeconomically our proposals for NEED hinge on three things first overall resource mobilisation for investment must remain unchanged from the scenario contemplated by the present government (as incorporated in the Eighth Plan), second, public finance available for investment (in communities, not the state sector as such) must rise by 1 4 per cent of GDP, finally, NEED must make no additional demands of foreign saving

These requirements have major implications for economic policy The most important one is the necessity to get the government s fiscal house in order to generate the needed fiscal surplus This alone will scarcely be adequate hence, there will be need to raise additional resources from taxation of incomes and wealth, land taxes, higher user prices and elimination of subsidies for the better-off segments (several such proposals are listed in the previous section

Given the redirection of incomes called for overall saving can be maintained only if growth does not fall below the SAP scenario SAP purports to produce growth driven by middle class consumption and foreign investment This is a recipe that runs the risk sooner or later of hitting another payments bottleneck NEED on the other hand, will have growth driven by the expansion of employment mass consumption and human capital accumulation It will be less prone to payments constraints and more able to contain fissiparous political conflicts Although the environmental and BN components of NEED no doubt require inputs of labour, capital and resources a good deal of the investments can be designed to be labouresque With higher priority given to food and informal production wage goods bottlenecks can also be avoided Hence, it seems improbable that NEED entails any additional risk of either inflation or lowered growth compared to SAP What is more, much of this activity can be organised with relatively few inputs of imports On the whole therefore NEED will be more stable than SAP while its growth trajectory need not be below SAP s

This order of changes in investment allocation and macro balances may seem infeasible But SAP contemplates a similar magnitude of changes from what was business as usual before the 1991 crisis To be sure NEED demands changes that go against the present tide in some respects But this reorientation commends itself as being most conducive to the future well being of the mass of Indians And it would be positively counter productive for India to wait for another crisis to make things happen

IV
Conclusion

It is easy enough to correlate environmental degradation In India with the expanding scale of population and per capita incomes Malthusian pessimists see environmental distress as signalling the exhaustion of the economy s carrying capacity' and call for slowing down or halting the wheels of growth, especially the growth of population This conclusion is belied by the potential

for economic growth based on existing technologies: growth can not only serve to raise living standards (which in turn is a prerequisite for reducing population growth) but also provide the means for redressing environmental ills. But we hope to have provided sufficient grounds in this paper for not supposing that realisation of this potential is automatic. The transition to a sustainable scale of economic activity, at which population is stabilised and incomes are sufficient to meet at least the basic needs of the whole population, is very far from being assured.

The fundamental obstacle to be overcome in accomplishing this transition is rooted in inequality of wealth and power. We have argued at length that, (a) inequality is inseparably linked with both suboptimal returns to private inputs and the inefficient and damaging extraction or use of natural resources. Damage ensues both from above and below: the perverse incentives of the rich and the marginalisation of the poor cause existing technologies to be inefficiently utilised and constrain the adoption of more efficient ones; (b) the failure of local co-ordination which underlies both economic inefficiency and environmental degradation is strongly related to wealth inequality; (c) improper public policy is itself the result of collusion between private and bureaucratic interests.

Economy-environment interactions thus add an important dimension to the adverse consequences for growth flowing from unequal wealth distribution. We have illustrated this with a number of important examples. While it needs to be acknowledged that harmful feedbacks from environmental losses to growth are not widely documented, neither their reality nor their potential can be assumed to be negligible. The reality is concealed in output aggregates and average yields; the potential is clouded by the uncertainty of our knowledge of the relevant processes. Soil erosion, waterlogging and salinisation, deforestation and declining commons have doubtless reduced primary sector output and yields. The past few decades have not only seen a sharp rise in the visible fiscal subsidies, but also increases in marginal capital-output ratios in critical sectors such as irrigation and power. Besides, many forms of resource subsidy and falling returns remain invisible. Health and productivity losses are even harder to document, especially for the marginalised populations.

The growth strategy currently in place is built on faith in trickle down and what may be termed long-run Malthusian optimism. It does little to address the problems of transition to a sustainable economy. While the prospect of accelerated growth under the strategy is, to say the least, uncertain, it is all but certain that both inequality and environmental degradation will worsen over the medium term. If the latter effects prove sufficiently large, the strategy will fail even on its own terms. It is in this sense that SAP is a gamble against the majority of Indians.

The alternative we have proposed is explicitly geared to solving the problems of the transition. Major policy thrusts and institutional restructuring under NEED are designed to promote equitable outcomes and to exploit complementarity between income gains, employment growth and environmental refurbishment. In the medium term, equitable growth is green growth; this can also enable a faster and less uncertain transition to a sustainable economy. To be sure, there are formidable problems mainly of a political nature that need to be overcome to put NEED in place. Uncertainty also attaches to the success with which its goals can be attained. But if the proposed alternative is a gamble, it is nonetheless a gamble for the majority of Indians. NEED, rather than trickle-down growth, can assure realistic hope for the majority of Indians who are poor, insure against costly social conflict and attendant economic instability, and provide the pause that seems needed to keep environmental degradation from getting out of hand. At least in this sense, we believe that NEED is not merely the path of prudence but also the alternative with a better prospect of success.

Notes

1 'Whither India's Environment?' Vol XXX, pp 677-86, April 1, 1995.

2 Observe that many renewables - including air, water, land and the environmental services of forests *in situ* - are non-tradable, so are some pollution-intensive sectors such as most power generation and transportation. But many of the products of land, water and forests, though subject to significant transport costs, are eminently tradable.

3 Suffice it to note that (a) liberalisation may hurt even healthy industries by unleashing unfair import competition (the former is exemplified by brand-name consumer products and the latter by public sector capital goods industries hobbled by unequal tariff schedules and political controls); (b) building up technological capabilities is a function of many weighty but largely domestic considerations that the simple-minded Darwinian logic ignores.

4 The problem is one of having policy instruments adequate to national goals. Trade taxation has long been justified (at least partly) in terms of the paucity of income-elastic or easily administered domestic fiscal instruments. Similarly, trade policy can (at least partly) redress the inadequacies of domestic instruments in regulating environmental externalities.

5 Few today would accept as realistic Gandhi's concept of trusteeship, the wealthy holding property for the benefit of all, or of voluntary abdications of wealth.

6 To be distinguished from 'get-rich exploitative and expropriative development' or GREED.

7 The socially necessary growth rate is to be determined by BN requirements rather than vice versa. The scenario in which forced degradation sets in is defined by the extent of BN unfulfiled, not a minimum growth rate. 'Sustainable development' is *not* "the pattern of structural change in natural and man-made capital stock ... which ensures the feasibility of at least a *minimum socially desired rate of growth* in the long run [Karshenas 1992: 9].

8 NEED complements previous attempts to adumbrate environmentally-oriented policies for India. Goldemberg et al (1988) took the energy sector as their focal point. Agarwal and Narain (1989) elaborated a blueprint for village-centred ecosystems, and Gadgil and Guha (1993) cover wider territory including political, sociological and ideological dimensions. Our own focus here is on the economic and institutional choices to be made and their economy-wide implications. Some of these elements were also championed in the approach to the Eighth Five-Year Plan put

CENTRE FOR DEVELOPMENT STUDIES AND ACTIVITIES

POONA

INVITES FACULTY POSITIONS

(a) One **READER** in Development Studies with a background in Development Finance. The applicants should have a Doctoral qualification with a minimum 8 years teaching and managerial experience in a reputed organization.

(b) One **LECTURER** in Development Studies with Doctoral Qualification in a selected social science field with a minimum of three years teaching and or research experience.

Those selected will be placed as per the U.G.C. Scales.

Interested candidates may send their application with Curriculum Vitae and names of two referees to the Executive Director, **CDSA**, P B. 843, Deccan Gymkhana, Pune 411 004 within two weeks appearance of this advertisement.

out by the National Front coalition [Government of India 1990]

9 See Streeten et al (1981) for a detailed discussion of this issue

10 Afforestation and wastelands development can be a handsome complement to agricultural employment A hectare of planted eucalyptus provides 600 700 person days of employment a year Farm forestry generates even more employment Such employment can be arranged to coincide with agricultural slack and thus be of considerable help to the underemployed including women [YCP 1993]

11 The controversy over the right to work' proposal has obscured the case for employment oriented infrastructural and environmental programmes While formally a justiciable right to employment may well be expensive or difficult to implement the substance of such a right can be secured with the sort of programmes envisaged by the Approach to the Eighth Plan or under the Maharashtra government s employment guarantee scheme Decentralisation (of which more later) will also help to counter infirmities of bureaucratic centralisation

12 The plan projections which cover a 15 year span from 1992 have been extrapolated to cover the period through 2013

13 We hasten to reiterate that the organised mode has not become more fit to survive than the subsistence mode by fair means (technology) alone foul means (enclosure etc) have indeed been employed and served also to strengthen its technological prowess

14 The current plan proposes an annual expenditure of $ 0 42 billion on family planning By contrast under the Bank s proposal such expenditure will amount to $ 1 58 billion in the year 2000 and under WIDER s proposal this will be $6 72 billion' The latter figures are computed by applying India s population share among LDCs to the WDR and WIDER allocations

15 Based on village survey evidence presented in Gadgil and Guha (1993 281) the following is the *mean* of lists of priorities roads irrigation drinking water education health care afforestation electricity veterinary services milk marketing and housing in that order But the variance around the mean is far from negligible

16 By contrast Gadgil and Guha (1993) argue for a neat separation of ownership by function state forestry for conservation farm forestry for industrial needs and joint state community management for subsistence and basic needs

17 See Chopra Kadekodi and Murty (1990) for an analytical and empirical investigation of the possibilities of participatory development in the context of local externalities and commons

18 All amounts are at 1991 92 prices A crore is 10 million and the current exchange rate is about Rs 31 per US dollar

19 Expenditures on basic needs and safety nets in the private sector but outside the market economy may well be non negligible and imperfectly captured in the SNA

20 According to Bowonder Arvind and Rao (1990) the annualised cost of existing (1988 89) environmental investments (stacks cooling towers FSPs of 99 per cent efficiency) in the thermal power sector was 4 51 per cent of sales Pollution measures suggested (flue gas desulphurisation, coal beneficiation and reclamation of mined land) involve five times the existing expenditure For large paper mills the cost of current effluent treatment investment was 1 per cent of total cost, the additional costs for colour removal was put at 5 per cent That is to say existing provisions cover only one sixth the required expenditures in these two major polluting sectors

STANDARD CHARTERED BANK — INDIAN BRANCHES
(INCORPORATED IN THE UNITED KINGDOM WITH LIMITED LIABILITY)

NOTES TO THE FINANCIAL STATEMENTS FOR THE YEAR ENDED MARCH 31, 1995

(Amounts in thousands of Indian Rupees)

1. SIGNIFICANT ACCOUNTING POLICIES

(a) General

The accompanying financial statements of Standard Chartered Bank — Indian Branches (the Bank) are prepared under the historical cost convention (as modified by Note 1 (e) below) on the accrual basis of accounting and conform with the statutory provisions and practices prevailing within the banking industry in the country

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities in foreign currencies are translated at rates of exchange notified by the Foreign Exchange Dealers' Association of India (the FEDAI) at the year end except in the case of deposits accepted under the Reserve Bank of India's (RBI) Foreign Currency Non Resident Accounts scheme which are valued at the relevant rates notified by the RBI and deposits accepted under the RBI s Foreign Currency Non Resident Banks scheme (FCNR B), which are swapped into rupees at the spot rate prevailing on the date of acceptance The profits/losses on the swaps arising out of the difference in the exchange rate between contract date and maturity date are reported under Other liabilities and pro rated over the tenor of such FCNR B deposits All profits/losses resulting on year end revaluations are included in the profit and loss account

(ii) Income and expenditure items are translated at the exchange rates prevalent on the date of the transaction

(iii) Outstanding forward exchange contracts and spot exchange contracts are revalued at the rates of exchange notified by the FEDAI prevailing at the year end and the resulting profits or losses are included in the profit and loss account

(c) Investments

(i) Permanent investments

Permanent investments are carried at cost adjusted for amortisation of premium over the period to maturity

(ii) Current investments

Investments in Government and other approved securities and other quoted investments are valued at the lower of cost or market value Market value is determined on the basis of the market yield curve specified by the RBI Unquoted investments, including investments in subsidiary companies, are valued at cost Treasury bills, commercial paper and other similar securities are valued at their carrying cost

(d) Advances

Doubtful advances are identified by periodic appraisals of the portfolio by management, and appropriate provisions are made The related interest on such doubtful advances is credited to an interest in suspense account and not included in profits until received Advances are stated after deduction of provisions and interest in suspense All provisions against doubtful advances are made on a gross basis with tax relief being accounted for only in the year of write off

(e) Fixed assets and depreciation

(i) Fixed assets are stated at historical cost less accumulated depreciation, except premises which were revalued at March 31, 1993 and stated at market values as at that date, determined by a Government registered valuer The surplus arising on revaluation has been credited to a revaluation reserve

(ii) All assets are depreciated on a straight-line method at the rates specified in Schedule XIV to the Companies Act, 1956 This represents a change from the practice followed in the prior years wherein assets acquired from 1984 and onwards were depreciated on a straight-line method and all other assets were depreciated on the diminishing balance method Had the Bank not revised its method of depreciation, fixed assets and the net profit for the year would have been higher by Rs 1 million In respect of revalued assets, depreciation is provided on the revalued amount and charged to the profit and loss account An amount equivalent to the depreciation arising out of the revaluation is transferred from the revaluation reserve to the profit and loss account

(f) Income recognition

Interest income is recognised on an accrual basis, except in the case of non-performing advances where it is recognised on receipt

(g) Staff benefits

The Bank has created separate recognised funds for pension and gratuity benefits for its employees Provisions for pension and gratuity benefits are based on actuarial valuations. However, retiring allowances paid voluntarily to pre-scheme retirees (ie employees retiring prior to January 1, 1978) are accounted for on a payment due basis

In respect of its Voluntary Retirement Schemes ('VRS'), the Bank pro-rates the aggregate cost over the pay back period of the VRS The amounts to be paid are determined on the basis of actuarial computations

Standard Chartered

STANDARD CHARTERED BANK — INDIAN BRANCHES
(INCORPORATED IN THE UNITED KINGDOM WITH LIMITED LIABILITY)

Net profit

The net profit disclosed in the profit and loss account is after accounting for, inter alia, provisions for income-tax, doubtful advances and other necessary provisions

INVESTMENTS AND CLAIMS

The developments during the current year in respect of various claims of the Bank on account of deficiencies in its assets, and claims against it, arising from its earlier transactions in the securities markets, are described below

(i) Subsequent to the year end, the Central Bureau of Investigation ('CBI') filed criminal charges against certain individuals named in the Bank's First Information Report consequent to its investigations into the Bank's criminal complaint in respect of the reported deficiencies

(ii) Civil action against several banks financial institutions and individuals to recover amounts, some of which are also the subject matter of the CBI investigations, continue to be pursued At March 31, 1995, the assets in question, after recovery of Rs 445 million during the year (1994 Rs Nil), amounted to Rs 1,268 million (1994 Rs 2,066 million), net of cumulative provisions and write offs aggregating Rs 10,989 million (1994 Rs 10,636 million), are included as claims under 'Other assets'

(iii) In addition, subsequent to the year end, the Bank has secured a favourable judgement and a settlement aggregating Rs 1,188 million in respect of certain claims which were fully written off or partly provided for, in an earlier year These recoveries and attendant losses, if any, pending final disposition, are to be recognised in the following years

(iv) The Bank continues to have claims against it aggregating Rs 2,087 million (1994 Rs 2,204 million), which are included in Contingent liabilities Of these, claims amounting to Rs 708 million (1994 Rs 1,060 million), if successful against the Bank, would result in the Bank itself having claims on other parties The Special Court constituted under the Special Court (Trial of Offences Relating to Transactions in Securities) Act 1992 has based on its judgement which declares "ready forward" transactions to be illegal, ordered the Bank to deliver securities or provide guarantees amounting to Rs 713 million (1994 Rs 216 million) in respect of certain of the above claims The Bank, along with other banks and the Indian Banks' Association, has appealed to the Supreme Court against the Special Court's judgement Based on legal opinions obtained, the Bank believes that it has a reasonable chance of reversing the Special Court s judgement

Because of the legal and other complexities surrounding the above matters, it is not possible to determine their eventual outcome In view of the above management considers that appropriate provisions and write-offs have been made in these financial statements and no further provisions are required

As part of the civil actions referred to in notes (ii) and (iv) above, certain of the Bank's investments continue to be affected as follows

(i) Bankers Receipts ('BRs') and Subsidiary General Ledger forms ('SGLs') issued amounted to Rs 322 million (1994 Rs 322 million), net of assets on account of BRs held Rs 480 million (1994 Rs 481 million) and SGLs held Rs 2,330 million (1994 Rs 2,328 million) at March 31, 1995 The securities underlying the BRs and SGLs are valued at the lower of the cost or market value Although these BRs and SGLs held, issued by nationalised banks and other institutions, have not been settled on their due dates, the Bank is confident of their settlement without any significant loss

(ii) Certain securities aggregating Rs 542 million (face value Rs 665 million) (1994 Rs 309 million, face value Rs 380 million) are still to be registered in the Bank's name by the issuers The Bank continues to pursue the registration of such securities and is confident of resolving related disputes without any significant loss

Following the completion of assessment proceedings in respect of assessment year ('AY') 1991-92, the income-tax authorities have raised demands aggregating Rs 161 million, after adjusting for a refund of Rs 665 million arising from a summary assessment for the AY 1992-93 This amount of Rs 665 million along with other amounts of tax paid in advance amounting to Rs 1,234 million are included in 'Other assets' Further, the assessment proceedings for the subsequent assessment years are yet to be completed The Bank considers the demands for AY 1991-92 and any other similar demands which may be raised for subsequent assessment years, to be largely unsustainable and believes the demands, if any, would eventually be set aside Accordingly, no provisions for the impact thereof has been made in these financial statements

3. INQUIRY PROCEEDINGS

Certain inquiry proceedings by regulators, also including the conduct of the Bank's past securities transactions and its vostro accounts, continue The outcome of such proceedings is uncertain Accordingly, no provision has been made in these financial statements to reflect the impact, if any of the outcome of such inquiries

Interest on deposits	1,264,641	1,476,780
Interest on Reserve Bank of India/ inter-bank borrowings	449,153	1,190,333
Interest refund and related payments to Reserve Bank of India	361,655	-
Others	21,089	8,285
	2,096,538	2,675,398

The amount against 'Interest refund and related payments to Reserve Bank of India ('the RBI')' above, relates to the show cause notice served on the Bank by the RBI during the year in respect of maintenance of inadequate cash reserves. The amount includes a refund of interest of Rs163 11 million relating to interest earned by the Bank on its deposits with the RBI in previous years

	1995	1994
19. OPERATING EXPENSES		
Payments to and provisions for employees	613,338	554,712
Rent, taxes and lighting	79,390	64,411
Printing and stationery	46,843	28,749
Advertisement and publicity	109,362	44,120
Depreciation on the Bank's property	49,392	41,648
Directors' fees, allowances and expenses	89	97
Auditors' fees and expenses	1,200	1,600
Legal charges	84,818	35,058
Postage, telegrams, telephones, etc	86,511	60,684
Repairs and maintenance	71,215	43,975
Insurance	9,739	15,558
Other expenditure	177,812	181,067
	1,329,709	1,071,679
Other expenditure includes		
Travelling	75,458	96,246

Included in 'Payments to and provisions for employees' is an amount of Rs15 9 million relating to gratuity which is management's estimate of the charge for the year after considering an actuarial valuation at May 31, 1994

20. VOLUNTARY RETIREMENT SCHEME

During the year, following a decision to rationalise its operations, the Bank introduced a Voluntary Retirement Scheme ('VRS') for certain employees The aggregate costs of the VRS, determined on the basis of actuarial computations, amounted to Rs 450 million This cost has been pro-rated over a pay-back period of five years The charge for the year amounting to Rs 90 million (1994 Nil) is included in 'Payments to and provisions for employees' and the balance is included under 'Other assets'

	1995	1994
21. PRIOR PERIOD ITEMS		
Adjustment to Head Office account	4,461	-

22. PRIOR YEAR COMPARATIVE AMOUNTS

Prior year amounts have been reclassified, wherever necessary, to conform with the current year's presentation

Standard Chartered

Standard Chartered Bank — Indian Branches
(Incorporated in the United Kingdom with limited liability)

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the accompanying balance sheet of Standard Chartered Bank — Indian Branches ('the Bank') as at March 31, 1995 and the related profit and loss account for the year then ended. Our audit was conducted in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not, drawn up in accordance with Schedule VI to the Companies Act, 1956. The financial statements are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of Standard Chartered Bank– Indian Branches as at March 31, 1995 and of its profit for the year then ended.

As explained in Note 2 to the financial statements, it is not possible to ascertain the outcome of various matters in respect of the Bank's past securities transactions because of the legal and other complexities surrounding these matters. The Bank believes that appropriate provisions and write-offs have been made in respect of such matters. Accordingly, no further provision to reflect the impact, if any, arising from these matters, has been made in these financial statements.

Also, as explained in Note 2 to the financial statements, certain demands made by the income-tax authorities are considered by the Bank to be unsustainable. Accordingly, no provision for the impact, if any, arising from this matter, has been made in these financial statements.

Further, as explained in Note 3 to the financial statements, certain inquiry proceedings against the Bank continue, the outcome of which is uncertain. Accordingly, no provision to reflect the impact, if any, arising from these matters, has been made in these financial statements.

Furthermore in our opinion,

(a) the transactions of the Indian Branches which have come to our notice have been within the powers of the Bank;
(b) the balance sheet and the profit and loss account are in agreement with the books of account, and give the information required by the Companies Act, 1956 in the manner so required for banking companies; and
(c) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books.

One Hundred Years of Brahminitude

Arrival of Annie Besant

V Geetha
S V Rajadurai

Annie Besant's arrival in 1893 lent prestige to a brahminical version of nationalism based on caste exclusivity and aryan superiority. The Justice Party and the Self Respect League countered this political brahminism through a cultural resistance centred around Tamil Dravidian fraternity.

ANNIE BESANT arrived at the southern port of Tuticorin in Tamil Nadu on November 23, 1893. Did she imagine then that her work and life in Madras would serve to catalyse into action a historical process that had long been unfolding and now merely waiting its 'appointed hour in these modern times'? A moot question, certainly but it is clear Annie Besant was not entirely unaware of the import of the political choices she made during her time as the editor of *New India* and an active participant in the activities of the Home Rule League in the Madras presidency. She saw herself as an inspired political muse who could quicken into energetic political action colonial south India's native elites.

In this 100th year of her arrival in the Tamil country, it seems important to assess her political mission in Madras since it proved extremely far-reaching in its effects. The Home Rule Movement in Madras which she galvanised into fitful action caused political opinion to crystallise into brahmin and non brahmin political formations. More importantly, the cultural vehemence she brought to her practice of nationalism resulted in the gradual emergence of a complete and total counter ideology. The non-brahmin resistance of political brahminism in the Madras presidency came to attack and challenge the social practices, cultural pride and philosophical worldview which, together, sustained brahmin hegemony in the related spheres of politics and culture. This resistance evolved into a full fledged ideology of Tamil nationalism in the 1930s, engendering thus a dramatic break in the progress of 'Indian' nationalism in the Tamil country.

In this article we attempt to indicate the significance of Annie Besant's political role and examine the nature and content of the Tamil nationalist response which arose as a spirited counter to the political brahminism she espoused and promoted.

I

Writing of the delegates to the first session of the Indian National Congress the *Indian Mirror* noted that the men from Madras seemed particularly impressive. It seemed benighted Madras was likely to outrun not only Bengal but every other province in the race for progress though preserving its national characteristics than any other province' [Suntharalingam 1974: 247-48]. *The Tribune* likewise was taken up with the Madras delegates 'all of good education and standing':

> Clad in conservative Hindu garments with their shining foreheads rubbed with sandal after the orthodox Hindu fashion and speaking in eloquent English about the various ways in which India should improve her political status they exhibited a spectacle at once charming and instructive charming inasmuch as it was a glorious sight to behold genuine Hindus (preserving intact ancient customs of their great race) holding the most radical views about politics instructive inasmuch as it was capable of infusing a belief that India could improve to the highest extent desirable its political status without being anglicised [Suntharalingam 1974: 247-48].

The delegates to the first session of Congress from Madras may be taken to represent the 'constituency' which attracted Annie Besant. Almost entirely brahmins there were exceptions – whether orthodox reformist or liberal these men of western learning were self conscious in their newly discovered political self-worth and acutely aware of the immense social and cultural distance that separated them from the rest of society in the Tamil country. They sought rather jealously to guard those privileges tradition, caste power and now colonial rule had conferred on them. This caste class of men desired like their counterparts elsewhere, to share government with their rulers and not oust them. They were often annoyed by the racism which marked the provincial bureaucracy but were not averse to the idea of empire. They were proud of their nationalist imaginings yet pragmatic enough to not flaunt it in a manner that would incur the wrath of colonial authority. Annie Besant with her studied opposition to the local bureaucracy, her reverence for 'God Crown and Country' (as was evident from the *New India* masthead that bore these words), her interest in Hindu belief, custom and creed, her qualified support for reform in the 'national interest' and finally with a decided penchant for agitational politics appealed to the deepest desires and fears, aspirations and apprehensions of the upper caste and self consciously brahmin congressman and his non political peers. Her predecessor colonel Olcott had merely vowed to reconstruct the 'ruined garden' of Hindu Sanskritic civilisation and to found an "Oriental Library – a second Alexandria" at Madras to further the cause of the Hindu faith [Suntharalingam 1974: 303]. But Annie Besant was willing to go further. She was prepared to transform the notion of caste exclusivity to represent a brave new political philosophy. She was convinced of the 'natural' superiority of brahmins over others as far as intellectual prowess was concerned:

> The caste system assigned learning to the brahmana and splendour to the kshatriya wealth to the vaishya. It has been the glory of the brahmana to be poor. Millennia of studious poverty have built up a body of fine nervous development refined sensitive and admirably adapted for its functions and have chiselled out an incomparable brain that has not its peers as a class in the whole world. The brain of the average brahmana compared with the average of any other class in the world is superior. Individual brains may be found anywhere of the finest value but taking as a class, the average brahmana brain is unrivalled and it has a quality a timbre if we may borrow an untranslatable word which is unique. Natural law has been utilised and the result is there before us [*New India* June 25 1915].

Annie Besant desired to 'restore' the lost pride and glory of the brahmins and thereby give back to them their 'rightful place as leaders of their country', in an appeal to the brahmana castes in 1913, she entreated that community to realise its destiny:

> There are two ways of change two ways in which privileges disappear when the people who no longer respect the privilege holders are angry with these privileges which outrage their sense of justice and if it goes too far you get a giant uprising like the French Revolution and the privileged perish by violence or you may have the wonderful

action of the privileged class in Japan, as privileged as any of the brahmana caste here who called on for their country's sake, stripped off every privilege they held and threw them at the feet of the Motherland in order that they may become free and great I have a vision which I hope is not only a dream of this mighty (brahmana) caste which in the past has given to India all that was greatest in her literature and arts and of you the natural leaders of the people by your high education by your brilliant intelligence by your powers of speech – I have had a vision of your mighty caste going forward to the feet of India the mother taking off the coronet of privilege from your own heads and laying it down in sacrifice at her feet I have dreamt that the great act of national sacrifice once accomplished splendidly performed India the Mother would stretch out her hands in blessing and say to her children who made the sacrifice Go back to your people and take your rightful place again as leaders still in India Give to them your splendid intellect, give to them your wonderful eloquence give to them the power of your past and the influence of your names crowned no longer with the crown of privilege but with the deathless crown of self sacrifice This is the vision I have seen Then the brahmans having stepped down will be raised up by the love of a grateful people who will follow leaders who are leaders of quality and not merely by accident of birth [*New India* November 27 1918]

This appeal shot through with pseudo millennial fervour, not only yoked together caste pride and patriotic sentiment but lent the politics of nationalism as it obtained in the Madras presidency a distinctive cultural weight and resonance Annie Besant's superb rhetoric of nation caste and culture helped to represent brahmin ritual and sacral authority as necessarily secular given these modern times She managed to endow brahminism with a new political and civilisational mission one that would confirm brahmins in their pride of place in the Aryan brotherhood' that colonel Olcott wished to constitute, 'regardless of race, creed or colour"

That Annie Besant's exhortations to the brahmins of Madras were taken to heart by a substantial section of that community is clear from even a cursory reading of her *New India*, especially its 'Voice of the People' columns Here are to be found debates on matters of social reform in the brahmin community, on the desirability (or not) of doing away with sectarian divisions among brahmins in the interests of a cohesive and unified 'national' brahmin community, on the Aryan (and therefore, brahmin predilection for liberty on the 'rightful' attitude to be observed by brahmins towards the depressed classes, as would be proper for men convinced of 'elevating' them into, at least, 'sudrahood' ! Common to these discussions was a romantic nostalgia for a lost aryan arcadia, often expressed as a will to recover that arcadia in the political here and now For instance, S Setlur, a regular columnist for *New India* in the period 1914-23 in a two-part essay, The Nature of Freedom enquired into the innate aryan love of liberty Arguing that the Western Aryan applied it (love of liberty) to the outer environment and the Eastern Aryan applied it to his inner nature', Setlur contended that the Manusmriti 'the old Aryan code common to all Aryans, whether European or Indian is better than anything that can be composed by the *New India* staff to express the main contention of the Home Ruler" Quoting Manu, he insisted that the "driving force of both Western and Eastern Aryans has been "their love of freedom the freedom which as Manu says the Aryan always regards as the sole test of pleasure and pain happiness and misery" Hence,

> the proverbially mild Hindu is so clamorous for self government while the brahmanas and the like whether English educated or not – who are known to have Aryan blood in them are in the frontline in the constitutional fight which is now raging while others are lagging behind and backsliding

Setlur however did not want non-Aryan Indians to turn away from the promises held out by the Aryan love of liberty They too have a right to freedom and self-government since they

> though not Aryan in blood have been nurtured in Aryanism for scores of years and have been saturated through and through with the Aryan love of liberty [*New India* September 1 1917]

It is not to be wondered then that Annie Besant's blueprint for a free, self governing India provoked an angry response amongst a section of the non-brahmin intelligentsia in Madras Chiefly professionals and publicists these men were keenly sensitive to the play of caste power in modern political life Colonial economic, political practices colonial knowledge systems and the missionary discovery of a perfidous brahminical Hinduism on the one hand and a received 'native wisdom which revered the idea of a seamless and ever-abiding 'Tamilness' on the other had produced in them a sense of being non-brahmin and, simultaneously, 'dravidian' and/or 'Tamil' Hence it irked their sense of self-respect that liberty should be associated with a caste known for its exclusivity and self-government be sought by a group of men who were distinguished by their resistance to equality amongst men and castes Thus, it was not before long non-brahmin publicists, professionals and the wealthy and powerful amongst them came to oppose political brahminism, both for its hegemonic intent as well as for its Aryan pretensions

II

Non-brahmin criticisms of Home Rule Nationalism represented two of the non-brahmin movement's early concerns the first had to do with coming to terms in a political sense with a community known for its 'powers of combination" and will for 'mutual advancement" [Naidu 1991 75] Non-brahmins could not abide by the good faith evinced by the brahmins in the national interest, since this was, itself, suspect To them the ideology of nationalism as it was advanced by Home Rulers and their denizen Annie Besant, seemed a sophisticated and elaborate attempt to re-interpret the ancient principle of brahminism M Venkatratnam Naidu, a prominent leader of the South Indian Liberal Federation (SILF) or the Justice Party as it was commonly known, argued that a genuine nationalism as opposed to and different from the extant one could be constructed only on the basis of common sympathies and a spirit of co operation between groups that felt bound to each other Do our present relations between caste and caste give rise to such sympathies? The answer should be a 'Decidedly not!' In some villages the lower castes are looked down by the upper castes The parariahs are given no place in the human category " Venkatratnam Naidu observed with considerable acerbity that the orthodox and exclusive minded, the doyens of varnashramadharma were ever averse to the forging of broader sympathies

> Some time ago there was an attempt to blend these different (caste) communities into one whole so as to generate that broad sympathy th it is characteristic of nationality Our orthodox friends have moved heaven and earth to oppose it and see it dropped The attempt made was the introduction of a bill to legalise the marriages between members of different castes and subcastes and legitimise their offspring What is it that influenced our friends to oppose it? Is it anything other than self interest? Is it not from a feeling that it would be a death blow to the caste? Is it not from a desire to keep their caste and birthright of supremacy intact? [Naidu 1991 36]

T M Nair, one of the founders of the SILF, also saw the Indian nationalist movement as having 'revivified the doctrines of varnashrama dharma" and deplored the phenomenon of a small, literate class "speaking for the other classes although (its) acquaintance with the (latter's) condition is of the remotest possible description"[*New India* October 23, 1918] K Subba Reddi, a youthful Justicite, likewise, doubted the nationalist intentions of a brahmin oligarchy which like its counterparts elsewhere in the world, 'has ever been subversive of the general interest of our country"

> While the British oligarchy touched us here and there, and that only superficially, the Brahmin oligarchy pursues us at every turn and makes itself felt in the innermost recesses of our life While the power of the secular oligarchy is finite and can be understood that of the spiritual oligarchy is infinite and inscrutable [Naidu 1991 75]

The apprehensions expressed by non brahmin publicists and political leaders with respect to the ideology of nationalism and its espousal by a class mindful of its oligarchic prerogatives were clearly a response to a politics that associated power whether social sacral or political, with knowledge and birth The SILF desired naturally to counter political brahminism/nationalism with a different approach to politics and came to imagine a different community and nation For nationalism to become a reality a living creed that would be appealing to all sections of society certain conditions had to be fulfilled The SILF defined these conditions in very specific terms (i) Primary education ought to be made free and compulsory so as to enable the emergence of a literate community of citizens (ii) Non brahmin castes were to actively pursue secondary and higher education and the poor amongst these castes ought to be given scholarships and concessions (iii) Equal representation of all communities in the services and administration must be ensured (iv) Communal safeguards must be provided in the matter of elections to the legislative council so that all communities in proportion to their numbers in the population, may be represented in Council It is clear that the SILF was not sanguine about the hegemonic strengths of political brahminism This brings us to the second concern of the non-brahmin movement its will to cultural resistance Non brahmin leaders were uneasy with the aryanist content in nationalist rhetoric since historically the intellectual prowess of brahmins derived from their appropriation of the sacredotal Aryan language Sanskrit and the denial of knowledge of this language to others Now that this time honoured pride in being the custodians of Sanskrit learning was being upheld and underwritten by the findings of modern philology and linguistics it seemed important that such rights to cultural supremacy be challenged and displaced

If the non brahmin political challenge to nationalism came to oppose the brahmin s appropriation of secular knowledge his acquisition of western educational skills and his familiarity with modern forms of government and administration non brahmin cultural resistance to nationalism sought to counter the political brahmin s 'spiritual' prerogatives his easy and sole access to a knowledge that lay embedded in everyday practices of language ritual and culture Non brahmin intellectuals even those who did not necessarily belong to the Justice Party, now came to dispute Sanskrit's claims to sacredness, its antiquity and even its very usefulness[2] Sanskrit was viewed less as a language and more as a carrier of values as a symbol of aryanism[3] In their turn, non brahmins extolled the virtues of Tamil, asserted its irrepressible *difference* from Sanskrit and argued it could stand on its own Such a celebration of Tamil had, in fact begun even in the last quarter of the previous century when Tamil scholars and intellectuals like their peers, elsewhere had come to discover the importance of history Men like Sundaram Pillai Arnold Sadasivam Pillay and V Kanakasabai Pillai had become all too aware of the need to articulate a dravidian myth of historical origins Mainstream colonialist historiography had proclaimed the notion of aryan beginnings to civilisation in the Indian subcontinent that was eagerly accepted and re articulated by upper caste chiefly brahmin writers and intellectuals Thus, these Tamil men of letters sought to refute the aryanist argument and came to propose a dravidian alternative a dravidian view of history It was held that such a history could be written on the basis of evidence gathered from Tamil literature through the ages Sundaram Pillay argued that Tamil literature of the past could be scoured for the most reliable data for reconstructing extinct societies and social conditions [Pillay 1985 29] The need for such a history was eloquently expressed by T Selva Kesavaraya Mudaliar when he wrote in 1904 that if they were to counter the taunts and disparaging comments of Sanskritists, Tamil lovers must produce evidence of their ancient culture and achievements [Sivathamby 1988 91] Dalit intellectuals and publicists during this period also expressed their need for a history free from aryan excrescences Men like Ayothidas Panditthar who characterised dalits as 'Poorva Tamizhar (original Tamils) produced a radical historiography that privileged dalits as the agents of history in the subcontinent who had, unfortunately, been duped of their rights to this history by scheming aryan priests [Geetha and Rajadurai 1993 2091-98]

Thus it was not long before that non-brahmin leaders clustered around the Justice Party and dalit leaders such as M C Raja resorted to an extremely imaginative and political use of history, as they attempted to disengage it from its Aryan/Sanskrit context Before we proceed to consider in some detail the intense politicisation of the Dravidian/Tamil myth first by the Justice Party and later by the Self-Respect League, it would be useful to consider the nature of Sanskrit Tamil encounters as these have occurred in Tamil history

The sense of difference which was believed to inhere in the Tamil language and dravidian culture and which distinguished these from an aryan-sanskritic ethos has been articulated at various times in Tamil cultural history This sensibility, often grounded in felt notions regarding the uniqueness of the Tamil language, conceived of Tamil as a metaphor which could at different times, yield different meanings Tamil thus came to embody the existential longings historical aspirations and even religious and spiritual agonies of Tamils Through significant segments of Tamil history it persisted as an invaluable site for the play and resolution of historical conflicts and for the emergence of questions over matters such as identity legitimacy and value K Sivathamby has argued that Tamil literary history if ably written and conceptualised could tell us important things about how Tamil rulers, aided ably by their literary and scholarly elite, looked to the Tamil classics whether sacred or secular and sought to derive legitimacy from constructions and reconstructions of texts into anthologies and definitive editions which they initiated and encouraged [Sivathamby 1988] P Krishnan has pointed out in an excellent and exhaustive study how references to the Tamil language and its uniqueness as well as references to the Tamil race and the Tamil country abound in Tamil literary texts He suggests that these references varied as they are in their meaning and significance indicative of the persistence of a stubborn historical memory of difference [Krishnan 1984]

It was through a deft and delicate use of Tamil that Saivite and Vaishnavite poet saints had countered the hegemonic and philosophic attractions of Jainism and Buddhism, while it was through a conscious 'Tamilising' of their creed that these religions had initially struck root in the Tamil country The Tamil language had stood the imperial Cholas in good stead when they sought to legitimise their rule through an invocation and celebration of brahminical Hinduism The two great Tamil epics of this period Kambar's *Ramayanam* and Sekkizhar s *Periyapuranam* not only testify to the grandeur and suppleness of the Tamil language but reveal how literature and hagiography may serve to inscribe the imperial present within Sanskrit as well as Tamil pasts These epics may be viewed as great legitimising historical narratives (in the manner of Virgil's *Aeneid* that attempted to endow an upstart Roman empire with a mythical aura) that brought together aryan notions of kingship, rule and culture and the patently Tamil and somewhat protestant bhakti traditions into a coherent seamless unity, a unity that was seen as present in Tamil life under the Cholas Tamil had figured as an important religious trope in the Srivaishnavite debates of post-medieval south India and was made a vehicle of a semi-popular, less rigid and broad-based Srivaishnavism,

subsequently identified with the Tenkalai prabhandic school of worshippers In the 18th century, when the Tamil country was rocked by a series of intermittent wars, an anonymous poet recalled in his long poem, Tamizh vidu Thoothu (Message sent through Tamil) the glories of the Tamil language and its antiquity and constructed in verse a veritable history of Tamil literature This poetic act was a response to the political anomie and disintegration that characterised the Tamil countryside on the eve of the British conquest Recognisably modern reconstitutions of Tamil language as the bearer of a distinctive cultural and civilisational impulse owed a great deal to the work of Christian missionaries who in their various bids to deploy that language to carry the message of Christ came to identify it with a useful vernacular popular tradition as opposed to a classical literary one Men like Bernard Schmidt and later Robert Caldwell, developed the theory that the Tamil language possessed a genius integral to it and owed nothing to Sanskrit Schmidt and his better known peer Rhenius argued that language constituted the very warp and woof of a peoples culture and held that particular languages expressed particular historical and cultural sensibilities Unlike the Tamil poets of yore they located this difference in everyday speech and in common and popular uses of Tamil[4] Missionary appropriations and use of the Tamil language fructified into a systematic attempt to record and describe the genius of Tamil when Robert Caldwell published his Comparative Grammar of the Dravidian Languages in 1856 Caldwell's work may be said to have systematised and rendered coherent those complex social, historical as well as linguistic developments which had obtained over a period of time in the Tamil country Caldwell's discovery of a Dravidian alternative to Aryan-Sanskrit culture was neither purely reactive nor fortuitous In his work, the sense of cultural difference which inhered in Tamil literature the visibly modern protestant articulation of the vernacular as a semi popular medium of expression and communication and the idea of a dravidian (as opposed to aryan) civilisation and family of languages propounded by colonialist linguist and historiographical research coalesced together Thus, a new episteme came into existence, one that would inform social political and cultural activity in the Tamil country

The political arrival of this new episteme was, of course, occasioned by the founding of the SILF The dravidian cause was now sought to be displaced from the sphere of culture into the sphere of politics In his welcome address to the first non-brahmin confederation held in December 1917 at Madras, P Theagoraya Chetty, the venerable leader of the Justice Party held that

> the genius of Dravidian civilisation does not recognise difference between man and man by birth The leaders of Dravidian thought Thiruvalluvar, Avvai and Cumbar do not claim to be born from the brain of the godhead The Nayanars and Alwars do not claim greatness in virtue of birth It is the Aryans who have introduced this birth distinction which they have elaborated into the system of varnashramadharma with its concomitant evils [Naidu 1991 139]

For Justice leaders the genius of Dravidian civilisation was a veritable touchstone that would help them measure the worth of aryan culture and judge the adequacy (or inadequacy) of this culture in democratic times P T Chetty for instance was quite clear and emphatic that brahminism was ever averse to democracy and noted that even when the tyranny of varnashramadhatma had provoked revolts brahmin oligarchic interests had refused to tread the path of reform but had, instead put down such revolts savagely

> More than two thousand four hundred years ago the Buddhist reformation sought to unify all classes but the influence of varnashramadhirma was too strong Ramanuja though a Brahmin tried to mitigate the rigours of the social and religious tyranny of the Brahmin priesthood and succeeded partially for some time But in course of time his priesthood sank to the level of the rest Basavaiya made a similar attempt which was attended with a similar result Thus every successive attempt to put down the Brahminical tyranny ended in failure so that the Brahminical influence grew stronger and stronger with the result that they elaborated the present system of untouchableness and pollution [Naidu 1991 140]

But the conscious politicisation of the dravidian idea by the Justice Party did not produce any long lasting results Not only was the party's oppositional cultural rhetoric not integrated with its political programme but its social and cultural agenda was not sufficiently radicalised for it to transform the dravidian (Tamil) value of social egalitarianism into a living creed in late colonial south India Besides there existed the inevitable hiatus between professed radical aims and possible practice.

III

The radicalisation of the non-brahmin movement was accomplished by the activities of the Self-Respect League From 1926 onwards, the League under the leadership of E V Ramasamy Periyar, and guided in its day-to-day propagandist and ideological work by a team of committed and eager men and women, issued open challenges to Hindu faith, custom, creed and practice The League professed a militant egalitarianism and insisted that unless social, cultural, linguistic and religious inequities were levelled out, self-government of India by Indians was an unrealistic and deceptive political option The League did not choose to work out a concrete political programme In the early 1930s it encouraged the formation of a 'Samadharma' party with avowed socialist aims but its socialism remained, at best, an index of its fundamental philosophy of self respect If socialism could help non-brahmins in their war against brahminism and help them constitute an egalitarian social order, it was to be welcomed The Self-Respect League's opposition to Hinduism and therefore, to aryan brahminism was more pointed and consistent than its political opposition to nationalism, so much so that the League managed to excavate a political underside to its anti aryanism and anti-brahminism For in the mid 1930s and after, the League's ideology and practice of self-respect came to form the basis of a new kind of politics in the Madras presidency the politics of Tamil nationalism

While the Self Respect League's leading ideologues including Periyar espoused a creed of conscious rejection of all social and cultural practices that implicitly or explicitly accepted brahmin ritual hegemony and the sacral powers of the Sanskrit language, they did not automatically extolled the virtues of dravidian culture or the Tamil language The self-respecters upheld Tamil chiefly because it was the spoken language of thousands of non brahmins but did not grant it an epistemological pride of place in their speeches and writings In rare instances, for purely prolemical purposes, they would proclaim the innate superiority of Tamil over Sanskrit but they were neither language purists nor romantics However, they chose to construct a political alternative to nationalism on the basis of, and in the name of Tamil nationalism It is clear that the significance they attached to the Tamil language was vastly different from that posited by the literati Likewise, they discovered new uses for the Tamil language and made it the marker of a new and radical political identity

The Self Respect League was thus suited to transform a cultural idea into an effective political weapon of protest Firstly, it functioned at a variety of levels as a broad-based forum for the expression of non-brahmin concerns as a popular exponent of a radical philosophy of rights and liberation as a militant pressure group that could induce, at times, the more staid Justice Party to adopt radical social programmes and finally as an arbitrator of opinion amongst a class of intellectuals with cross cutting affinities, that is, a class that comprised Tamil enthusiasts and anti Sanskritists as well as

those who were iconoclasts and who eschewed atavism of the Tamil as well as the Sanskrit variety. Secondly, the League's practice of self-respect, which included militant campaigns against untouchability, encouraging inter-caste marriages, upholding the rights of all non-brahmins including dalits to enter temples and other public spaces, challenging superstitious and obscurantist religious and cultural practices, protesting the subordination of women and the demeaning of their selfhood through various means, was chiefly agitational. It rarely awaited legislative or executive ordinances to ratify its radical measures. Thus, it came to adumbrate a new kind of activity, one that was not oriented towards specifically political objectives but whose social relevance and unrelenting intensity defined a different practice of politics. The Self-Respect League achieved an intensive politicisation of culture and thereby came to anticipate an entirely novel politics, one that would yoke popular energies to specific demands and integrate these within an overall counter-hegemonic framework

In 1937, the Madras presidency's provincial congress ministry announced its decision to render the teaching and learning of Hindi compulsory in educational institutions. The decision had the chief minister C Rajagopalchari's (henceforth Rajaji) specific sanction. The issue of Hindi-imposition became all-important overnight as various sections of society excitedly discussed its implications. Rajaji's own congressmen, amongst whom were a substantial number of non-brahmins, were surprised and incensed. Even the pro-Congress press in the presidency was astounded by the decision to impose Hindi and, initially at least, opposed it [Viswanathan 1983: 161-234]. The loudest and most vociferous protests emanated from the Tamil literati quarters: poets, songsters, scholars of Tamil learning, purveyors of Saiva Siddhanta, a self-consciously dravidian philosophical alternative to the brahminical vedanta, doyens of the 'Pure Tamil' movement who had been campaigning since 1914 for a purification of the Tamil language and a purging of Sanskritisms and aryan ideological constructions. Members of the Justice Party also joined in the protest against the cultural imposition on dravidian people and spoke and wrote against it. The anger against Hindi cut across class and caste lines, with self-respecters, samadharmists and even a few brahmins registering their ire [Viswanathan 1983: 161-234]. In terms of actual participation in the anti-Hindi campaigns, the brahmin presence was, perhaps, negligible. But it is significant that the sense of being 'Tamil' was not always overwhelmed by the sense of being 'brahmin' (though the contrary could be sighted, as it often did). Ultimately, the success of the anti-Hindi agitations owed a great deal to popular participation. Those men and women who had been 'awakened' into self-respect were now eager to define themselves in terms of a horizontal dravidian (Tamil) community. The fight for Tamil, or more specifically the rejection of Hindi, catalysed the emergence of a new identity, one that would transform non-brahmin concerns into dravidian-Tamil ones. The old negative identification was exchanged for a new positive one as the fight against Hindi (and by implication against Sanskrit and aryanism, and the new national outlook that wished to erect a modern state on the basis of the latter) crystallised into a desire and demand for a differently organised and imagined fraternity of peoples, the dravidian (Tamil) nation.[6]

It is clear the struggle over language was fought on multiple platforms, and not all those who joined the fray felt equally or intensely about the Tamil language or its hoary past. The self-respecters themselves were wary of plunging the anti-Hindi movement into an abyss of atavism and romantic nostalgia. However, they realised the importance of counterposing Tamil to Hindi, of defining the language to signify a form of resistance in itself. Tamil ceased to be a mere instrument of a cultural opposition but came to embody a non-brahmin will to power and counter-hegemony. The centring of resistance to northern, Sanskritic dominance in and through the Tamil language possessed a long history, as we have attempted to indicate. This history assumed form and coherence for the modern times in the anti-Hindi agitations. Just as at each historical conjuncture, the resistance or hegemonic intent signified in a particular use of Tamil realised itself differently so was the cultural resistance centred in the Tamil language during the anti-Hindi campaigns interpreted in specific historic terms. Likewise, Tamil also came to represent a well-defined historic sensibility.

What was the meaning of Tamil for the self-respecters? Periyar was quite clear as to what Tamil did *not* mean, as far as he was concerned

> I love Tamil, but not because it is my mother tongue or because it is the national language; or becuase it is a language that can stand on its own. Neither is my love due to its antiquity, to the fact it was the language spoken by Lord Siva or the one created by the sage Agasthya... I love a particular thing for its quality, for its usefulness. I do not extoll a thing just because it happens to be my language, my nation, my religion.
>
> If I ever am convinced that my nation cannot help me realise my ideals, if I cannot make it serve this purpose, I will move away from it. Likewise, if I ever come to think that my language will not serve my ideals, if it will not help my people live with honour and help them progress, I will give up on my language and look to something that would have its uses.
>
> If I love Tamil, it is because I have weighed the good that I expect to come out of it against the ill effects its disappearance is likely to cause and have, on that basis, extended my love and support. Similarly, I oppose Hindi on the basis of the ill effects it may cause. I oppose it because I have realised the nature of these effects and unable to tolerate them have decided to resist them; but not because I will not be able to understand Hindi or that it is an alien language [Sitambaranar 1939: 213-15].

This may sound starkly utilitarian, but Periyar's 'use' theory of language helped him assess a language's ideological resonance and disambiguate its usefulness from the superstitious and worthless dross that rendered it opaque and unfit for rational, intelligible communication. Thus, he held that a Tamil language free of Sanskritic influences and aryan concepts would be ideologically acceptable to a self-respecter

> It is my opinion that the Tamil language can help its people progress in all fields, liberate them and help them lead a rational and honourable life. Of course, some may ask if Tamil is indeed capable of all this. Tamil may not help its people achieve all of these, but I do know that, of all the Indian languages, Tamil possesses those arts, manner of speech and custom as well as the words requisite for a peoples' progress [Sitambaranar 1939:213-15]

Periyar was no purist and advocated the language should borrow freely from all languages except Sanskrit to enrich and extend its vocabulary. He held that it was because of the unwelcome intrusion and takeover of Tamil by Sanskrit, the Tamil people who had discovered civilisation and culture when people elsewhere were yet to leave their savagery behind had failed to keep up their initial momentum and had, as a consequence fallen behind in the march towards progress [Anaimuthu 1974:972-93]. To Periyar, and indeed in the general discourse of self-respect, Sanskrit signified an aryan-brahmin will to power and dominance through religion and caste. Sanskrit, thus, embodied an entire system of values, the means through which the Tamil people had been enslaved. Periyar argued that identities are fixed in speech and reified through reiterative habits of language use. The Sanskrit words for caste, salvation, marriage, obsequies, heaven hell etc, had entered the Tamil speaker's vocabulary and had been internalised over the years: "These are words that foment superstition and blind faith", held Periyar, and insisted that there are no original Tamil words that correspond in meaning to these and other such words

that are so clearly of aryan import [Anaimuthu 1974:971] Periyar blamed the eager acceptance of an aryan religion, such as Saivism by the Tamil rulers of the past for the language's low status

> The Tamil kings accepted an aryan faith and to explain the concepts and nuances of this faith Sanskrit words were invoked If we were to free Tamil from aryanism and Saivism we will be able to get back our old Tamil [Anaimuthu 1974 971]

If Tamil was to be brandished as a weapon against Sanskrit and aryanism, if it was to be an antidote to a language which according to Kuthoosi Gurusamy had awed people through the ages by its sheer sonority and incomprehensibility and its association with caste power, what did it stand for? In other words how could it be a powerful arm of the anti brahmin resistance? Tamil had to, necessarily express the ideology of self respect and bend itself to new habits of speech use and communication Periyar clearly desired to modernise Tamil and to render it supple enough to express new ideas scientific concepts and his own philosophy of self respect The aims of the Self Respect League were to

> do away with blind faith superstitions and meaningless rituals remove the inequalities created in society in the name of caste religion and class and make the people live as a *single* community in brother(sister) hood creating (among them) a spirit of self awareness so that they would henceforth live as rational and self respecting beings [Anaimuthu 1974 458]

Tamil was to facilitate the constitution of this new fraternity of peoples endow them with a distinctive identity and equip them with a sense of a cultural and political difference to resist political brahminism/ nationalism

In upholding the liberative energy and uses of Tamil, Periyar was clearly responding to the political use of Hindi His criticisms and rejection of Sanskrit were directed against Sanskrit s modern descendant Here, Hindi was conceived not so much as a language as a modern metaphor of brahminism The historical linkages brahmins had established between knowledge and power were now being reforged In a historical context dominated by the rhetoric of nationalism the caste-class basis of nationalism had to be effectively expressed and rendered consensual Hence, the leaders of Indian nationalism had chosen Hindi as the means to forge, and in some instances, impose this consensus [Rajadurai forthcoming] Periyar since his early political days, had waged an unrelenting war against nationalism devoid of social reform and pledged to caste exclusivity He had characterised nationalist ideology as the ideology of an unreformed brahmanocracy' Therefore, when the Congress ministry in Madras attempted to constitute polity and society in the Madras presidency along nationalist lines, by forcing a unity on the basis of a falsely imagined 'national' language, Periyar sensed the will to power, so evident in Rajaji's move If this decision were to fructify into a sustained campaign to displace the hard-won gains of the non-brahmin movement and marginalise the counter hegemonic work of the self respecters Periyar knew that the work of several years would come to nought He was scornful and sharply critical of the reasons that were offered in defence of the imposition of Hindi

> Rajagopalachariar and his cohorts tell us that if we were to learn Hindi we would be able to read Tulsiram s Ramayana that we could easily learn Sanskrit read the Hindu scriptures It seems we must learn Hindi for spiritual reasons for our salvation Nowhere is it said that our worldly uses will be served by Hindi [Anaimuthu 1974 651]

This scorn and anger however did not blind him to the essential political intent behind the Congress move In fact his repeated insistence on the suitability of the Tamil language to its speakers lifestyles their conditions of existence and to the social egalitarianism he desired, was an index of his political will and desire to make Tamil the badge of a new national identity

The anti Hindi agitations served to constitute Tamil as the marker of a new political spirit one that was sustained by a creed of social justice and animated by a cultural desire to preserve and render durable a sense of historical difference For the self respecters this difference was less a matter of cultural glory than of ideological worth For Tamil enthusiasts of various persuasions the self respecters philosophy of language and society was less important than their political will and determination to resist Hindi For the thousands of men and women who eagerly joined the campaigns against Hindi Tamil self respect and their future prospects for liberation were at stake For all concerned with the struggle neither caste nor class distinctions mattered since the imagined community of free self respecting dravidians made possible for the moment of the struggle at least a horizontal comradeship

Annie Besant had been haunted by a vision of a polity and society guided by and responsive to the benevolently despotic intentions of a class that had retained its exclusivity and ruled by its power over language, ritual custom and culture Now that vision was transformed into its dialectical opposite as men and women came together to claim a rule that would split knowledge from power and democratise it that would unite rather than divide people on the basis of language, a rule that would flow from mutuality and self respect and not from a finely timbered brain

Notes

1 See for instance Justice Sadasiva Iyer s highly interesting disquisition on the changed' face of chaturvarna New India July 3 16 1916

2 The Tamil literati many of whom were arch Saivites and ardent scholars of the language may be cited as examples

3 N Subramanian points out in his *The Brahmin in the Tamil Country* (Ennes Publications, Madurai 1989) The identification of Brahmin with Sanskrit a non-regional language lost him the sympathy of regional interests the situation was to cost him dearly when regional expressions became sharp and politically effective in the twentieth century The occasional but brilliant contribution made by Brahmin scholars to Tamil thought did not however save the brahmin *per se* from the consequences of exclusive proprietary interest in Sanskrit, particularly the sacred texts (p 147)

4 For an exhaustive account of missionary scholarship put to popular use see Sarojini Packiamuthu *Vividhyamum* Tamizhum, Gurukulam Lutheran Theological College and Research Institute and APATS (India) 1990

5 O Kandasamy Chetty a former Justice publicist and a radical reformer wrote bitterly of that party in 1922 that it had allowed its social reform agenda to gather dust as it consolidated its power in office (see *New India* September 23 1922)

6 It is important to keep in mind that the categories Dravidian and Tamil were often considered interchangeable Even though some Telugu Justicites subscribed at times to the notion of an overarching dravidian identity it was common knowledge that dravidian almost always meant Tamil

Schedule 17: Notes Forming Part of the Accounts for the Year Ended 31st March, 1995

1 Principal Accounting Policies

A Accounting Conventions

These accounts have been prepared according to the historical cost convention and in accordance with statutory requirements prescribed under the Banking Regulation Act 1949 and practices prevailing in the country

B Transactions Involving Foreign Exchange

1 Foreign currency assets and liabilities are translated on the Balance Sheet date at the rates notified by FEDAI except balances under Foreign Currency Non-Resident Account which are valued at the relevant rates specified by the Reserve Bank of India

2 Contingent liabilities on account of outstanding foreign exchange contracts have been reported at the contracted rates

3 Profit and Loss on revaluation of outstanding foreign exchange contracts on the Balance Sheet date at the rates notified by FEDAI have been included in the Profit and Loss Account

C Investments

In accordance with the guidelines issued by the Reserve Bank of India the investments of the Bank are classified into 'Permanent Investments" – which are intended to be held upto the date of maturity and Current Investments" – which are not intended to be held up to the date of maturity and are generally intended to be traded in Permanent Investments are valued at cost unless cost is more than the face value, in which case the premium is amortised over the period remaining for the maturity of the security Profit (net of tax) on sale or redemption of Permanent Investments is transferred to Capital Reserve where as loss on sale or redemption of Permanent Investment is charged to revenue

Deutsche Bank AG

(Incorporated in Germany with Limited Liability)

In respect of Current Investments other than Treasury Bills and Commercial Paper the same are valued at cost or market value which ever is lower the depreciation if any on revaluation is charged to revenue In case of inter change of investments from current to permanent prior authorisation of the Local Advisory Board is obtained and depreciation, if any, resulting from valuation based on lower of market value or cost is fully provided for Treasury Bills and Commercial Paper are valued at carrying cost

The market value of Current Investments is worked out by means of an appropriate capitalisation of yield method as recommended by the Reserve Bank of India

D Advances

1 Provision for doubtful advances The Management reviews the advances portfolio each year in addition to periodic reviews and based on their judgement sets aside specific provision for doubtful advances The provisions made duly consider the provisioning norms instructed by Reserve Bank of India The provision for doubtful advances is made to the satisfaction of the auditors after considering present value of realisable security held by the Bank in respect of such advances

2 Advances are stated net of bills of exchange rediscounted and specific provision in respect of doubtful debts

E Premises Furniture and Fixtures etc

Premises furniture and fixtures including vehicles and equipment have been valued at cost less depreciation Depreciation has been provided on straight line method at the rates specified by Head Office which are higher than the rates prescribed under Schedule XIV to the Companies Act 1956 Lease premium is being amortised over the lease period expected to be extended Depreciation on building is provided from the day it is put to use and in case of other assets pro rata depreciation on additions is provided as per Head Office guidelines in the year it is put to use No depreciation is provided on assets in the year of sale

F Income Recognition

i) Interest Income is recognised on accrual basis and in the case of non performing advances the same is recognised on recovery and settlement

ii) Commission and fees are treated on accrual basis except commission on Letters of Credit and Guarantees which is accounted as income on cash basis

G Staff Benefits

Liabilities in respect of retiral benefits to employees are provided for by payments to duly recognised Gratuity Fund Pension Fund and Provident Fund The amount of payments to the Funds except for Provident Fund are determined on the basis of actuarial valuation

H Net Profit

The net profit disclosed in the profit and loss account is after

i) Provision for taxes on income in accordance with statutory requirements

ii) Provision for doubtful advances

iii) Adjustments so as to value trade investments at lower of cost and market value

iv) Other usual and necessary provisions

2 Lease Premium Amortisation

The Bank has two premises (including one acquired during the year) on land leased from Bombay Municipal Corporation Based on legal opinion and correspondence with the State Government regarding the general policy of renewal of such leases, the Management is of the opinion that the lease would normally be extended Hence the lease premium of Rs 391 255 375 paid to acquire the lease rights has been amortised on the basis of the lease period expected to be extended instead of the residual contracted lease period Consequently a sum of Rs 3 913 407 has been amortised during the year

3 Head Office Reserve Account

Head Office Reserve Account represents funds remitted by Head Office and a portion of approved remittable surplus for an earlier year retained by the Bank to meet the cost of acquisition of residential and bank premises at Bombay and to meet capital adequacy norms as per the Reserve Bank of India s guidelines

4 Special audit initiated by Reserve Bank of India

During the year Reserve Bank of India initiated a special audit to verify the transactions of the Bank under the Foreign Currency (Non Resident) Account Scheme for the period 1st April 1990 to 31st March 1994 The verification of the transactions of BombayBranch is in progress and the report for New Delhi Branch has been submitted to the Management and Reserve Bank of India Pending review by Reserve Bank of India liability if any cannot be determined

5 Audit under Section 142 (2A) of the Income Tax Act 1961

During the year the Income Tax department initiated a special audit under Section 142 (2A) of the Income Tax Act 1961 for the financial year ended 31st March 1992 and 31st March 1993 which has been completed and the report has been submitted to Management and the Income Tax Department Pending review of the same by the Income Tax department provision for liability, if any, has not been made in the Financial Statements for the year

6 Regrouping

The previous year's figures have been regrouped/rearranged wherever necessary

Deutsche Bank AG

(Incorporated in Germany with Limited Liability)

Auditors' Report on the Accounts of the Indian Branches of Deutsche Bank AG

We have audited the attached Balance Sheet of the Indian Branches of Deutsche Bank AG (Incorporated in Germany with limited liability), as at March 31, 1995 and the Profit and Loss Account of the Indian Branches of the Bank for the year ended March 31, 1995 annexed hereto

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with the notes thereon are not required to be drawn up in accordance with Schedule VI of the Companies Act, 1956 The accounts are therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule of the Banking Regulation Act, 1949

We report that

The Bank has two premises (including one acquired during the year) on land leased from Bombay Municipal Corporation. Based on legal opinion and correspondence with the State Government regarding the general policy of renewal of such leases, the Management is of the opinion that the lease would normally be extended Hence, the lease premium of Rs 391,255,375 paid to acquire the lease rights has been amortised on the basis of the lease period expected to be extended instead of the residual contracted lease period Consequently, a sum of Rs 3,913,407 has been amortised during the year Had the amount been amortised based on residual contracted lease period, the charge to the Profit and Loss Account for the year would have been Rs 20,470,681 and the profit for the year lower by Rs 16,557,274

Subject to the above

1 We have obtained all the information and explanations which in our opinion and the best of our knowledge and belief, were necessary for the purpose of audit and have found them to be satisfactory,

2 the transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branches of the Bank,

3 in our opinion, proper books of accounts as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of those books,

4 the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;

5 In our opinion, and to the best of our information and according to the explanations given to us, the accounts read together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for the Banking Companies and on such basis; the Balance Sheet give a true and fair view of the state of affairs of the Indian Branches of the Bank as on March 31, 1995 and the Profit and Loss Account of the profit of the Indian Branches of the Bank for the year ended on that date

Income Spreading Mechanisms in Common Property Resource

Karanila System in Kerala's Fishery

John Kurien
A J Vijayan

An important feature of small scale fishing communities in developing countries is community-evolved mechanisms to ensure that the resources, livelihood opportunities and revenues from the common property fishery are spread as widely as possible in the whole community. This article examines the case of an income spreading mechanism which has been practised in the coastal encircling net fishery of Kerala for about half a century. It shows how a combination of inappropriate technology choices coming in the wake of free market policies, and a now increasingly common pattern of state patronage of rural producers, often combine to create open access conditions in common property resources and thus put eminently desirable communitarian systems of sharing and caring under great strain.

AN important feature of small scale fishing communities in developing countries is the existence of numerous community evolved and community sanctioned mechanisms to ensure that the resources, livelihood opportunities and revenues from common property fishery are spread as widely as possible in the whole community. These take various forms and include, to mention a few, free distribution of fish, community taxation of earnings, rights to all willing persons to go fishing and spreading of income to an extended contingent of crew.

These mechanisms of sharing and caring, which have been instituted as an integral part of the distribution of the returns from the common property have often disappeared under the pressures of modernisation and the wholesale incorporation of these communities into the world market. Some have however withstood these pressures by being modified to suit the compulsion of the times.

Platteau and Baland (1989) have elaborated extensively on a variety of arrangements for the sharing of income and the spreading of work. Many of these arrangements also form the basis of traditional, informal social security systems in communities which are united predominantly by family, kinship, ethnic or caste ties. Platteau and Baland also propose a matrix of six different combinations of such income and work spreading arrangements based on a classificatory schema which considers (a) whether the income and work spreading are done *within* or *between* enterprises and (b) whether the costs of the income and work spreading are borne by the workers (crew) owners, or both. Their analysis points out that the small scale fishery sector is a remarkable case in which all six forms of income sharing through work spreading can be found, even though some forms are more frequently encountered than others.

In this paper we wish to examine a specific case of income spreading within a fishing enterprise where the cost is borne by the crew – constituted of working owners and non owner workers. Our case is unique in the sense that a significant number of persons have a custom bound claim to income even if they do not perform any productive work activity on that particular fishing trip. It is called the karanila system. Karanila literally means 'shore status' - a privilege granted to anyone who expresses a demonstrable interest in associating with a fishing unit by being present on shore when the unit is ready to set out to sea. Except on the very first occasion, there is no compulsion for the person to actually go fishing.

This income spreading mechanism has been practised in the coastal encircling net fishery of Kerala for only about half a century. In that sense it can hardly be classified as traditional in vintage. Consequently it exemplifies the contours of a still viable income spreading mechanism operating within the context of a common property resource. We make an analysis of the mechanism's origin, rationale, development and threatened existence today. This portrays how a combination of inappropriate technology choices coming in the wake of open market policies, and a now increasingly common pattern of state patronage of rural producers whose lives are inextricably linked to natural resources [what Dassmann (1988) has named 'ecosystem people'], often combine to create open access conditions in common property resources and thus put communitarian systems of sharing and caring, though eminently desirable, under great strain.

We begin with a brief description of the development of fisheries in Kerala – one of the foremost maritime states in India. Kerala is noted for the fact that its coastal waters are the most productive in the Indian Exclusive Economic Zone (EEZ). Kerala also became famous when it was selected to host the world's first internationally aided development project – the Indo Norwegian Fisheries Community Development Project. This is followed by a description of the canoe and ring seine fishery called the 'thanguvallam' or 'thanguvala' fishery in the local parlance. We describe the technique and the evolution of production relations within these fishing units so as to provide the material and social background to the karanila system. The working of the karanila system is then examined. The attempt is to describe its *modus operandi* and understand its rationale and evaluate its relative merits and demerits in the context of work and labour organisation. The role that this income spreading mechanism plays in the context of an overcapitalised, low income fishery, in which fishermen have no alternative employment prospects is examined. Finally, we make an assessment of the role that the karanila system has played in sustaining the small scale fishery sector of Kerala's fisheries. We also assess its usefulness and meaning in the process of creating a new fishery management regime.

Development of Kerala's Fisheries

Kerala, situated in the south-western corner of India and with a population density of 660 persons per square kilometre, is one of the most densely populated states in the country. It is estimated that the population density of its fishing villages is about three times the state average. Kerala accounts for only about 10 per cent of the country's 6,000 km coastline but is the home of over a quarter of India's half a million active marine fishermen. The coastal marine waters of the state (up to a depth of 50 m) are almost equal to its land area – 13,000 sq km. Consequently there are about 10 active fishermen for every single sq km of

coastal waters compared to the all-India average of three for a sq km.

This high density of fishermen in Kerala is to an extent compensated by the fact that Kerala also has the most productive coastal waters in the country since it is blessed with a highly productive upwelling system The average fishery potential of this inshore sea is 30 tonnes per sq km while the all-India average is only 13 tonnes The estimated maximum sustainable yield (MSY) of Kerala s inshore sea is about 400,000 tonnes This resource is composed of numerous fish species each attaining varying sizes at maturity and available in relatively small stock sizes – a standard characteristics of tropical waters The three major economic species are oil sardines mackerels and penaeid prawns which together account for over 50 per cent of the MSY

Until the 1960s fishing in Kerala was almost entirely dominated by the non mechanised, traditional country craft – kattumarams plank and dugout canoes – using a variety of tackle and gear These traditional technologies had evolved over the centuries to suit the specific ecological context of the seas as well as the distinct characteristic of the various fish species Most of these fishing gear were passive in nature and ecologically benign With the coming of nylon nets and better marketing infrastructure the artisanal fishermen started harvesting more fish leading to a steady increase in fish harvests all through the 1960s By 1970 the marine fish landings by them using traditional fishing craft reached the MSY level The overall picture in Kerala fisheries was one of abundant fish availability in the inshore waters easily accessible to the large number of artisanal fishermen There seemed very little scope for significant improvements in their craft and gear so as to increase the catches The common property nature of the fishery was also not posed with any major threats The technological barriers such as the need to have fishery specific skills, and social barriers like artisanal fishing being the occupation of a lower social caste, prevented free entry of capital and labour from outside the traditional fishing communities into the fishery

The government had been making attempts to 'modernise the fishing industry with the introduction of mechanised boats The Indo-Norwegian Fisheries Community Development Project (INP) had as early as 1953 introduced mechanised gill net boats without much success This failure was followed by the introduction of small trawlers using bottom trawl nets The introduction of this new technology coincided with the fast expanding market for prawns in developed countries Thus, the coastal waters off Kerala, which contain one of the world's richest penaeid prawn resources, became a main motivator of the state's fishery modernisation programme [see Kurien (1985) for details of the INP intervention in Kerala]

The efforts of the state to provide mechanised boats to artisanal fishermen between 1960 and 1969 failed About 1,200 trawlers distributed through co-operatives went into the hands of middlemen and outsiders The monopoly of the skill-specific and caste-bound nature of traditional fishing began to give way to strong commercial sector The coastal waters and the fish in it which the traditional fishing communities considered their own heritage and community property was converted into an open access resource By 1980 Kerala had over 3,000 trawlers and more than 30,000 traditional craft competing for space and product in the coastal waters Mechanised purse-seiners were introduced in the early 1980s in the central maritime districts of Kerala Large quantities of oil sardine and mackerel the mainstay of traditional fishermen began to be caught by these purse-seiners As a result the productivity as well as the income of traditional fishermen declined sharply between 1960 and 1982 [see Kurien 1992]

Responses to Lopsided Development

This lopsided development in the state s fisheries sector forced the traditional fishermen to look for new ways of survival Their reaction w i mainly at two levels collective action in the form of unionisation and individual technological strategies such as motorisation of their craft and the adoption of a variety of more active fishing gear to compete with the trawlers and purse-seiners

Initially there were spontaneous clashes and conflict in the open sea between traditional fishermen on the one side and trawlers/purse seiner operators on the other Soon the traditional fishermen emerged to form a militant fishermen agitation spereheaded by an independent trade union – the Kerala Swathantra Malsya Thozhilali Federation (KSMTF) [see Kurien (1992) for details on the process of building this union] From 1981 onwards every year, Kerala wintnessed organised struggles of the traditional fishermen The main demands were exclusive fishing zones for traditional fishing crafts total ban of purse-seiners and night-trawling and the banning of bottom trawling during the monsoon months considered the breeding season for many fishes

The militant struggles of the fishermen's movement in the state still continue and have had many favourable outcomes too Many expert committees were set up by the state to look into the issue of overfishing and suggest proper management measures The enactment of the Kerala Marine Fishing Regulation Act (KMFR Act) 1980 empowered the state to prohibit, restrict and regulate fishing so as to conserve the fish wealth and to protect the interests of traditional fishermen. Using this power, the government promulgated many management measures over this period They included a ban on purse-seiners and on trawling at night, zonal restrictions for mechanised boats, registration and licence for fishing, etc But the most unfortunate part is that many of these important management measures remain largely on paper

In 1989, the government conceded the long-standing demand of banning monsoon trawling The enforcement of this ban, though for a shorter period, during the last five years can be considered the most important fishery management action in the state However, this was also challenged in the court of law, and in 1993 the boat owners succeeded in getting a verdict in their favour, they were allowed to leave the harbour to 'open seas' during the ban period in the name of 'deep sea fishing

Apart from unionisation the other major response of the traditional fishermen was their adoption of new technologies to enhance their fishing capabilities The major manifestation of this response was the motorisation of traditional craft, which began in 1981 This became possible only after the liberalisation of imports that opened the market to Japanese outboard engines (OBM) backed by hard sell marketing strategies In a matter of five years these Japanese MNCs like Yamaha were able to ensure state patronage for their products As a consequence artisanal fishermen were *en masse* 'locked in' to this new state of-the-art propulsion system, ruling out all other viable indigenous options for a more self-reliant solution to motorisation

By 1991 there were a total of 9,914 motorised craft in Kerala The share of motorised craft in the total marine fishing landings of the state increased from 3 per cent in 1981 to 37 per cent in 1985 and touched 63 per cent in 1989 Motorisation gave the impetus for using more harvest-efficient gear designs as well as enhancing the size of gear taken by each unit What remained of the non-motorised units – mainly the 15,000 non-motorised kattumarams – accounted to a mere 5 per cent of the fish landings in 1989 harvested by a fifth of the active fishermen population

Motorisation and new gear designs resulted in a large increase in the capital investment in traditional fishing units During the eight years from 1981-89 at constant prices there was a near 10 fold increase in the average capital investment per unit [PCO-SIFFS 1991] With motorisation, the operating costs of traditional fishing also increased phenomenally While examining the costs and earnings of different motorised units of the state, it was found that fuel costs alone accounted for between 12 and 52 per cent of the value of output depending on the type of craft gear combination Motorisation had

compelled the fishermen to borrow heavily to remain in fishing. The net result was a high level of indebtedness to middlemen and merchants. This has in turn meant that fishermen lost what little effective control they originally had on the sale of their fish. If the high depreciation and interest rates in the informal credit market were taken into consideration, many of the units would hardly be economically viable [PCO-SIFFS 1991].

Kerala faced a situation where the trawlers, purse-seiners and the newly motorised craft using more efficient gear caught less and less fish each year. From a peak of 4,30,000 tonnes in 1973-75 the fish landings dropped to an abysmal 2,94,000 tonnes in 1979-81, and in 1985-87, despite motorisation, recovered only to 3,37,000 tonnes. At the level of the individual units, the relative stagnation in the aggregate fish catch led to more fishing effort since fish prices increased and partly offset the cost of the enhanced effort for some time. The negative economic, social and ecological consequences of overfishing are many and are a burden for society as a whole. Despite this, the commercial sector (trawlers and purse-seiners) and the small-scale sector (motorised craft) cannot be viewed alike for the purpose of effective fisheries management.

In Kerala, where a large contingent of active fishermen exist, the negative social consequences of excessive fishing effort of the small-scale sector is comparatively less serious than that of the commercial sector. Like in many other cases, in Kerala too the social relations of production in the small-scale sector are shaped more by non-economic factors. Profit and accumulation are only two goals among many. The ownership patterns, division of labour and sharing systems assure more distributive justice in income and more equal access to fish resources. This helps them to uphold the value of the collective good in favour of maximising personal gain. Such social values are also linked with and strengthened by traditions and customs. Though now under stress and strain, they still provide a good basis for a more just and sustainable fisheries management.

In this context, the karanila system of income spreading thanguvallam fishery in Kerala has special significance. The role it played before the 1980s, before motorisation and the changes that have occurred thereafter, are the focus of the remaining sections of the paper.

Thanguvallam – Ring-Seine Fishery

The karanila system is most prevalent in the canoe and encircling net fishery popular in Alleppey and Ernakulam – the central maritime districts of Kerala state. Before the advent of motors, the encircling net was called the thanguvala and its craft the thanguvallam. Motorisation permitted enhancing the size of the net and the fitting of rings to the top and the bottom, making it function like a purse-seine and thus becoming more harvest efficient. This new modified net came to be called a 'ring-seine'. In this section we describe the technical and organisational aspects of this craft-gear combination in a historical perspective for a better understanding of the social and material basis of the karanila system.

Fishing Operations

The thanguvallam fishery has a long tradition and history and has always contributed a major share in Kerala's fish landings. The thanguvallam is a large wooden plank canoe most suitable for calm weather operations. The thanguvala, an encircling net, is used in this craft as an effective gear to catch fast-moving, pelagic shoaling fish like oil sardines and mackerel. Prawns are also caught using this net when they move up to the surface layers of the sea during the pre-monsoon months during what is called the chakara season. The thanguvala is a rectangular shape of net when spread out. When a moving shoal is spotted, the craft is driven ahead of it and one of the crew on sighting the shoal jumps into the water with one end of the net. The craft is then rowed quickly around the shoal with the other end of the net so as to encircle it. The lower portion of the net is then lifted out of the water thus enclosing the shoal in it. The net is quickly lifted onto the thanguvallam.

This craft and gear combination underwent tremendous changes after motorisation. While the overall sizes of both the craft and gear increased considerably, the most important transformation is in the form of the attaching of rings to the thanguvala, thus creating a sort of mini-purse seine which came to be called 'ringvala' or ring-seine. The fitting of rings made the encircling, enclosing, and lifting processes much easier and quicker. However, all these net related operations continue to be achieved with human hands aided by only a pulley to pull up the bottom of the net.

Prior to motorisation, the technique of using a thanguvallam and the thanguvala existed only in the central maritime districts of Kerala. But after motorisation and the introduction of the ring-seine, the immense success in increasing productivity and efficiency of fish harvesting resulted in this technique spreading quickly all over Kerala. Consequently a wide variety of traditional types of encircling nets and boat seines used for harvesting pelagic species were all replaced by the ubiquitous ring-seine. The change was not smooth. There were clashes between traditional fishermen arguing for and against it. In some districts the traditional 'courts of the sea' banned the ring-seine. However such traditional sanctions did not [illegible] became the predominant gear all along the coast of Kerala from Quilon district in the south to Kasaragod district in the north. A traditional fishery marked by its diversity became a mono-gear fishery in less than five years.

The state played an important role in the diffusion of this technology by providing credit and liberal subsidies to fishermen groups who were keen to acquire a motorised thanguvallam and ring-seine. By 1991 there were a total number of 1,741 ring-seine units in Kerala. It is estimated that they provided employment for about 60,000 fishermen – nearly half the active fishermen in the state [SIFFS 1992].

The present motorised thanguvallam-ringseine are of varying size both with respect to the craft as well as the length and depth of the ring-seine. The smaller sized craft below 15 metres length use only one motor, while those above that use two motors and also carry larger ring-seines. In Alleppey district the unit is composed of only one craft whereas in Ernakulam an additional carrier boat is used. In the northern districts as many as four craft can be involved in the fishing operation. The capital investment required for a large unit is about Rs 5,00,000. This equals the capital investment of an average trawler in Kerala. But unlike trawlers, it is the gear – the ring-seine – which accounts for about 60 per cent of the investment.

Ownership Pattern and Crew Organisation

About 50 to 60 years ago, the thanguvallam units in Alleppey district were owned by a landlord class. Men from the traditional fishing communities were hired for work through a kind of bonded labour system. The influence of a peasant uprising in the district the 1940s – the Punapra-Vayalar struggles – resulted in land reforms and dispossession of the landlords. The greatly influenced the ownership pattern of the thanguvallam and production relations in the fishery sector. Bonded labour in the fishery was abolished and the fishermen formed groups which collectively owned and worked on the thanguvallam units. Group sizes varied from 4 to 25 and kinship was most often the basis of group formation. This pattern of ownership and group formation continued until the advent of motorisation.

The state came into the picture in the mid-1980s offering for the first time a substantial amount of financial incentives for traditional fishermen. Such largesse was normally linked to political patronage and became an important basis for group formation to lay claim to these loans and subsidies. Kinship and clan were no more the main basis for group formation on these new fishing units. A common feature observed in Ernakulam district has been that the number of members in the ownership group reduces over time

due to friction between members of such artificially formed groups. However, all members of the ownership group are working fishermen. In the beginning they raise some money for initial capital. Very often this forms only a small portion of the capital required and the rest is borrowed from merchants and moneylenders. Borrowing from the organised sector like the nationalised banks has also been on the increase.

Prior to motorisation, when the thanguvallam was comparatively smaller in size, a crew of 15 would be enough to operate the large thanguvallam. Now a minimum of 25 persons is required to operate the larger motorised units. A crew of 35 to 40 can be accommodated on it. For the medium type 'choodavala' (anchovies net) unit a crew of 15 to 20 will still do. In areas where the carrier boats are used, an additional working crew of 5 to 8 is needed. Motorisation has helped the thanguvallams to enhance their area of operation into slightly deeper waters. However, despite the use of motors for propulsion, the increase in the size of the gear has warranted an increase in the amount of physical labour required in each unit. The hauling of the net is still being done physically with bare hands Consequently, despite the freedom from arduous rowing, and a larger number of crew, the fishing operation has become harder and more strenuous. Skilled crew are few. They include: an experienced helmsman to guide the craft and with a good eye to spot shoaling fish; one person in charge of the net to release it properly, layer after layer; one person who looks after the rings and ring rope to handle them efficiently; and the engine operators.

Most of the thanguvallam units have an excellent system of account keeping. An accountant/cashier (normally one among the ownership group or from that family) is entrusted with this job. He uses a diary or an account book in which the details of each day's operating cost, quantity and type of fish caught, sales proceeds, names of crew, etc, are noted down. Interestingly, in order to cross-check there are others too among the crew noting down the accounts continuously, because balances often carried forward and the system of sharing sometimes becomes very complex and involved.

There is a leader for the unit selected from among the ownership group. He conducts the weekly meetings in which all the crew participate. The main function of these meetings is to share the net income for the week; decide on whether or not to grant karanila to the semi-permanent crew who availed of leave; settle old balances; and discuss other work-related issues. It is important here to distinguish two types of sharing – the sharing of fish and the sharing of the net income.

The first charge on the fish which is landed by any thanguvallam unit is for the consumption needs of all the working crew and those with karanila (shore status). Equally important are the legitimate 'first right' claims on the fish by widows, handicapped members of the community, and others, such as the barber, who render services in the community. Their shares in the form of fish are first handed out. Only after the settlement of these claims of consumption, community social security and service payments are fulfilled, is fish put to auction.

The proceeds from the auction are rarely fully received on the spot. Usually an advance is paid which will be used to pay for the food taken by the crew in the tea stalls and to purchase fuel. At the end of a week, once the payments are received from the merchants, the accounts are settled at the weekly meetings.

From the total sales proceeds the total operating costs – fuel costs, sales commission, cost of the food expenses of the crew and the customary taxes – are first deducted leaving the divisible income. Forty per cent of this divisible income is the claim of the owner group (returns to capital) and the remaining 60 per cent is shared among the crew (returns to labour). Prior to motorisation the ratio was 30.70. In instances when the divisible income is small (say, below Rs 2,000), the whole amount is shared among the crew alone. The crew of course always includes the working fishermen of the ownership group. The skilled fishermen get a greater number of shares. The amount apportioned for the crew (i e, 60 per cent of the divisible income) is divided into a number of shares before it is distributed to the claimants. The total number of shares is calculated in the following manner.

Total number of shares = [working crew x 1.5] + [non-working crew x 1] + [2 or 3 extra shares for skilled crew]

What distinguishes this system of calculation of shares is that a significant amount of money is paid out to a group of persons who have no productive role *in that particular fishing trip*. The system of giving a share of the earnings to the non-working crew who stay back on the shore – i e, those with karanila – had its origin more than half a century ago. Old fishermen explained that the origin of this system is closely related to the evolution of the group ownership system in the thanguvallam fishery.

Karanila System

The transition from a feudal to a communitarian system of ownership spearheaded by an ideologically motivated political struggle thrust a moral responsibility on the new class of owner-workers to create mechanisms of income spreading. The fishery was deemed community property, and the wealth from it was intended for all. The rationale of providing fish for consumption to all, and the karanila system, are rooted in this context.

To understand the logic of the karanila system we must first comprehend the nature of the crew formation and crew rotation system in the thanguvallam units. The term 'crew rotation' as it exists now in the thanguvallam fishery of Alleppy and Ernakulam districts does not really imply that there is always an excess number of fishermen attached to a unit who then take turns to fish.

Strictly speaking, the ownership group is the only 'permanent' crew attached with the unit. There is another set of fishermen, who have no ownership stake in the unit but who in normal circumstances will always be attached with that unit. Generally they work with a particular unit for a minimum period of one year and then they may or may not opt to continue with it. These fishermen can be termed the 'semi-permanent' crew. There are various influencing factors which help a fisherman to choose the fishing unit with which he will attach himself. These include distinguishing features or specialities such as the newness of the craft and gear, size of the unit, efficiency of the ownership group, their history of success in the fishery, and even its celebrity status in the village.

There is yet another category of fishermen normally associated with a thanguvallam unit. They constitute a highly mobile group (they can even be from outside the fishing community, or migrant fishermen) whose number cannot usually be predetermined. They can be termed as the 'temporary' crew; they come and go or change units as and when they like. It is this group of temporary standby crew who are granted karanila or 'shore-status'

On any fishing day, the total number of fishermen present at the seashore with the unit at the starting time of the fishing trip are considered the crew of the units *for that day*. From among those present, the required number will get into the craft and go fishing. The remaining karanila fishermen stay back on the shore. The names of the working crew and the non-working crew (karanila) are noted down by the accountant every day. There is no rigid pattern in this crew rotation system. Normally no one is forced to get onto the craft or advised to stay back. However, when a new fisherman offers to work with the unit for the first time he must join the working crew at sea and prove his 'seaworthiness'. This practice precludes the possibility of persons unwilling or unable to work at sea from exploiting the karanila system.

As indicated earlier the karanila fishermen are merely entitled to one share from the divisible income allotted to the crew. The semi-permanent workers enjoy certain extra benefits and concessions. They are eligible

for leave of absence at times of sickness, marriages or deaths in their family, etc. During such leave they are considered karanila and hence given one share. Nowadays even if members from the semi-permanent crew go for fishworkers trade union meetings or to participate in the rallies they are also given the karanila share. However, such leave of absence will have to be ratified or sanctioned by the group at their weekly meetings. The semi-permanent fishermen also get annual festival allowances, bonuses and cash advances from the owner group. From the money kept apart to pay customary taxes (about 2 per cent of the net income), after paying the contributions to church/temple trusts, trade union, etc, the balance is assessed and shared among the semi-permanent crew as bonus. The ownership group may also give extra money from their income to these fishermen.

The role of karanila fishermen in the fishery gains extra importance in two specific situations. When the size of the ownership group is small, the permanent and semi-permanent fishermen together are not sufficient to operate a fishing unit. Karanila fishermen are crucial to the working of the unit in such a circumstance. Also, in the pelagic fishery, which is the mainstay of the thanguvallam units, during the pre-monsoon chakara season it becomes necessary and indeed lucrative to make more than a single trip during the day. In such situations there is a need for more than just the right number of crew to man a single trip. Having a large karanila fishermen group ensures work rotation so that each trip-team will get sufficient rest and recoup their energy for the next trip.

Consequently, just as the group ownership pattern has come to stay in Alleppy and Ernakulam district, the karanila system also became an integral part of the production relations and got wedded to the social relations of the fishing communities of the area. Karanila has become an unquestioned social custom and all thanguvallam units continue to remain open to accept any fishermen willing to do work.

The fact that karanila fishermen were not 'attached' to any particular unit meant that when the fishing season was bad they were free to leave the unit and seek better income-earning opportunities elsewhere. This meant that there was no undue 'social pressure' to increase fishing effort during the natural lean fishing season. The karanila system consequently provided the basis for fuller work opportunities and, more importantly, for a spreading of income in the community. It ensured a fair degree of distributive justice so long as there was community control on the number of fishing units in the village and a good, stable fishery.

Being a custom-bound income-spreading mechanism, we need to examine the impact of modernisation on its functioning. The three most important aspects of the modernisation of the thanguvallam fishery have been the introduction of motors and the ring-seine, and the intervention of the state in providing these productive assets.

Impact of Modernisation

The motorisation of thanguvallam units first took place in Alleppy district in 1981. Initially the motorised thanguvallams continued to use thanguvalas. The mere increase in the speed of encircling a shoal resulted in a boost in the catch rates and the total fish landings. In 1985 the first ring-fitted thanguvala was launched. It was a resounding success.

It was during this time that the state entered in a big way into extending credit and subsidies for purchasing fishing craft and gear for the artisanal fishing sector. Being a highly politicised action [see Kurien (1992) for details] it resulted in a sudden spurt in the number of thanguvallam units in the area. The ownership groups formed to take advantage of the incentives were based on criteria other than kinship. One crucial impact of this was that the erstwhile community control on the nature and level of investment in the fishery got substantially eroded.

Between 1985 and 1989 there was an unrestrained growth in the number of motorised thanguvallam units using ring-seines. Consequently there was a sharp increase in the number of fishermen required to man the fishery. This demand for labour attracted a larger number of persons from various walks of life into the fishery. Though they came largely from the traditional fishing communities and other communities residing near the fishing villages, they also included persons who had other sources of income. Even some lower-level government functionaries availed of the karanila to earn extra money from the initially vibrant and expanding fishery. While there was resentment to this kind of influx of labour availing of the karanila system, their claims had to be honoured so long as the custom was still valid. Soon, however, the excessive effort in the same fishing area resulted in a drop in the catch rates to below the 1981 pre-motorisation levels but at a near ten-fold increase in the investment [Kurien 1988].

One response to this situation of lower catch rates of oil sardines and mackerels was the introduction of a net called the choodavala – a small-mesh ring-fitted encircling net to fish for a hitherto unexploited stock of anchovies. Initially choodavalas were taken on the thanguvallams as subsidiary gear. But when the catch of anchovies was seen to be large and often unprecedented for this area, the gear began to gain prominence.

The fishermen of Alleppy were thus faced with a tricky situation in 1989. They wanted to get rid of their big motorised thanguvallams

Concept

PUBLIC POLICY ANALYSIS AND DESIGN

Vivek K. Agnihotri *I.A.S.*

Foreword by **Prof. A.M. Khusro**

484 pp. (561-2) Hardbound Rs. 700

A Seminar on Public Policy Analysis and Design was organised by LBS National Academy of Administration, Mussoorie in the context of the increasing concern for public policy. The volume includes the papers presented at the Seminar and explores the themes of Sectoral Policies and Methodologies providing a wide coverage of public policy issues from different perspective.

V.K. Agnihotri is Joint Director and Coordinator of Public Administration Faculty at LBS National Academy of Administration, Mussoorie.

and ring-seines was found to be used on smaller thanguvallams. The answer to this problem was found by introducing their ring-seines to the northern districts of Kerala where the fishermen were also getting large doses of state finances and eager to switch to using motors Consequently there was a large movement of fishery capital from Alleppy and Ernakulam district – the pioneer regions in motorised thanguvallam-ring-seine fishing – to the northern fishery districts of the state

Between 1989 and 1991 there was a sharp decline in the number of motorised thanguvallam-ring-seine units in Alleppy and Ernakulam from 200 in 1989 to 93 in 1991 [SIFFS 1992] This 'boom and bust' process in the fishery had its impact on the karanila system too With half the units suddenly leaving the fishery of the area, a large number of fishermen were left with no employment Some fishermen switched back to using smaller non-motorised fishing units Some others regrouped themselves and invested in new motorised choodavala units

Both these adjustments took time In the interim everyone took undue advantage of the karanila system and began to attach themselves to the remaining thanguvallam units During this transition period the karanila system faced its severest test During this period, each of the remaining units were faced with a situation of having more karanila fishermen than those working at sea on the unit Even when the catches were good the average income to the individual crew was depressed because of the claims of the karanila fishermen

Given the nature of the sharing system in the fishery, the main burden of income spreading due to karanila is borne by the working crew and not by the owners of the unit However, to the extent that most owners are also involved as crew, their total income is also reduced, although their share as owners remains unaffected The larger number of karanila fishermen therefore in effect reduced the income of the working fishermen This began to cause social strains between the semi-permanent crew and those who availed of the karanila

The response to this situation was to adopt new rules for the karanila system One such rule, now accpeted by all the units in Ernakulam, is that if a minimum of 35 fishermen are not on board the craft, no fishermen – even if they are part of the ownership group – who stands on shore can claim the karanila share that day Another measure has been to abolish the karanila for the semi-permanent crew who avail of leave of absence There was only one exception to this leave taken by such workers when they are indisposed due to an accident at sea while fishing on that particular unit A further measure has been the very recent practice of cooking food on the craft This means that only those who fish will be entitled to food. The practice of treating the food expenses on shore – given to the karanila fishermen as well – as part of the common expenses of the unit was terminated Despite these rigid rules it is reported that there continue to be days when the karanila shares number as many as 25

Karanila System Assessment

The karanila system was a recent custom created mechanism for ensuring an adequate supply of labour to the fluctuating needs of the fishery and also a system for income spreading If the resources of the coastal waters were the community's heritage then the earnings from it needed to be spread out for the benefit of the whole community This was the socio economic and cultural underpinning of the karanila system One strong indicator of the success of the system can be gleaned from the fact that compared to the other maritime districts of Kerala, the prevalence of Gulf migration in search of jobs is the lowest in these two districts where the karanila system operates [Government of Kerala 1987]

Since the first claim to the fish is for consumption of the household of all those associated with the fishing unit, it can be said that the karanila system has ensured that the nutritional status of a larger number of persons has been taken into account Another contribution of the karanila system to the fisheries management in Kerala has been its contribution to supporting the creation of a powerful fishworkers organisation in the state The two districts of Alleppy and Ernakulam provide the largest trade union of artisanal fishworkers – the KSMFT – with its strongest base Since fishermen attending trade union activity were given the karanila share they could participate without jeopardising their subsistence incomes This was a possibility not open to fishermen in any other part of Kerala

The advent of state-sponsored anarchic increase in fishing assets, particularly motors and more efficient gear; the consequent gross over-investment in the fishery, the 'boom and bust' phenomenon of a pelagic fishery, and the breakdown of community institutions, have threatened the karanila system A redeeming feature in this bleak scenario is that the elements of community homogeneity and interdependence which were fostered by the karanila system are still deep-rooted in the social fabric of the fishing villages in these two districts Consequently, despite this temporary setback it is indeed possible to restore to the fishery the principles of the communitarian system of sharing and caring

Such efforts cannot be unidimensional and merely attempt to revive the karanila The decline of the features of the karanila are only a consequence of the large malaise in the fishery. As a result, addressing the larger question of management of the fishery as a whole must be the focus of attention. A paramount initiative in this effort will be to reassert the common property right to the coastal fisheries as being the unalienable rights of the active fishermen alone It must also be recognised that the anarchic and competitive approach to increasing investment in a common property resource – which can also be perceived as a way of spreading work and income *between* fishing units – will only lead to socially undesirable levels of capital deployment and energy use and most certainly lead to economic and biological overfishing

Both the above call for the revitalisation and strengthening of the institutionalised communitarian arrangements which existed in the artisanal fishing communities This can only be undertaken with the collective will of these communities and the appropriate support from a state which is convinced about the economic and social rationality of such institutions in the management of the fishery

[This article is a revised version of a paper presented at the Indo Pacific Fishery Commission Symposium on Socio Economic Issues in Coastal Fisheries Management held in Bangkok in November 1993]

Total Factor Productivity Growth in Indian Industry

Ravindra H Dholakia

Bakul H Dholakia

IN response to our comment (*EPW*, December 31 1994) on the paper by Balkrishnan and Pushpangadan (hereafter BP 1994), the authors have sought a few clarifications on the numbers we have estimated using their data (*EPW* March 4 1995) In their reply [BP 1995] they have also repeated some results already reported in their original paper [BP 1994] and claimed it to be substantial further work which strengthens their finding of no turn around during the 1980s in the total factor productivity (TFP) growth in the Indian registered manufacturing sector Moreover, they have ignored and tried to minimise the genuine limitations of the method of double deflation by referring to the ideal conditions which are hardly ever obtained or are practically non feasible even in the most advanced countries Here we would like to provide the necessary clarifications on the method and data used by us to estimate the TFPG in the Indian Registered Manufacturing Sector through the double deflation method, and also examine BP's claim (1995) of further support to their findings of no turn-around during the 1980s

Although BP (1985) have accepted our point that the double deflation method of getting the real value added critically depends on the construction of the price index for the materials, they 'remain sceptical as to what is possible under the present situation *with regard to data availability*" We had clearly pointed out in our comment that the input-mix essentially depends on the output-mix and that the output-mix significantly differs between the registered and unregistered manufacturing sectors Since the product-mix in the manufacturing sector is readily available from the *National Accounts Statistics* (CSO) for different years, the effect of the differing product mix on the input-mix can be estimated by assuming that within each product category, the input structure remains the same in the registered and unregistered manufacturing sectors Although this is an empirical assumption, the state of data availability especially in the unregistered manufacturing sector in India, does not allow its testing On this assumption, which happened to be the best possible and evidently the most plausible one to make under the present situation, we derived the break-up of the total input use as given in the CSO transactions matrix for 1973-74 between the registered and unregistered manufacturing sectors This method uses the available information on the differing product mix between the registered and unregistered manufacturing sectors which BP have ignored Moreover, as Sastry (1995) has clearly pointed out and as is actually used by Dholakia and Dholakia (1992) for constructing an input-output table at regional level, enough data exist in the 10 volumes of the Annual Survey of Industries to get the detailed input structure by individual industry groups in the registered manufacturing sector Contrary to what BP (1994 and 1995) seem to be suggesting, it is not the availability of the data but the time required to process and use the available data which poses the actual constraint The point we made in our comment was that any half hearted application of the double-deflation method should not be considered a conclusive evidence for or against any hypothesis like the turn-around of the 1980s We had clearly shown that refinements in the input price indices would lead to different results not only quantitatively but also qualitatively under the double deflation method

For this purpose we had made use of the same data set as reported in BP (1994) in the case of all variables except the input price indices which were estimated using different weights as given in our comment (*EPW* December 31, 1994) Moreover, since our purpose was to show the sensitivity of the qualitative conclusions about the behaviour of the total factor productivity growth to the weights used to arrive at the input price index, we used the average annual compound rate of growth based on the end-points to illustrate the difference [1] On the other hand, BP (1995) appear to be highly impressed with the econometric testing through what they consider to be the best procedure' of fitting a semi-log trend equation with dummy for both the slope and the intercept It is well recognised in the literature that this is not necessarily the best procedure (see, for instance, Boyce 1986) It assumes not only non-differentiability but also discontinuity which makes it difficult to interpret This procedure, moreover, assumes constancy of the error variance which may be questionable Low value of the D-W statistics in their fitted regressions also points to the possibility of specification error which is further confirmed by 'eye-balling' the TFP series in question It clearly suggests an S-shaped curve which defies a semi-log linear trend specification Thus, for illustrating a point, if annual compound growth rate based on two end-points is not considered good enough, the use of semi-log trend rate may also not be the best procedure, because with a specification error, the estimates become biased and the statistical tests carried out by BP become invalid Through numerous trials, we found that a semi logarithmic cubic function without a linear term fits the data better than most other functional forms The following is the fitted regression

$$\text{Ln (TFP-DD)} = \underset{(92\ 31)}{4\ 40} + \underset{(4\ 80)}{0\ 00594t^2} - \underset{(-3\ 94)}{0\ 00026t^3} + e$$

R-Square = 0 744, D W Stat = 1 71
F-Value = 23 22,

e is error term, brackets are t-values
(Note This regression is based on the TFP (DD)' series as reported by BP in their reply, *EPW*, March 4, 1995, Table 1)

It is also interesting to note that the same functional form with similar results fits the data well for the other TFP series reported by BP (1994 and 1995)[1]

The equation implies that the growth rate in total factor productivity in the registered manufacturing in India continuously increases with time from 1970, reaches a maximum and then declines If any arbitrary dividing line like 1980 is drawn, the average growth rates before and after should be compared Such a comparison clearly provides support to the hypothesis of a higher average growth of TFP for the post-1980 period as compared to the pre-1980 period

The main point of contention according to us, however, still continues to be the way the real value added is calculated particularly for estimating the TFP growth As Sastry (1995) argues any deflation – single or double – in practice involves approximation It is thus a matter of perception coupled with affordability in terms of time and resources at the disposal of the researcher The whole question boils down to a non-random measurement error in the dependent variable which cannot be subjected to the usual statistical testing as is attempted by BP (1995) because it would involve an unknown bias in the estimates The theoretical and interpretational considerations in the appropriate measurement of real value added have to weigh in the final choice to be made by the researcher In this context David (1962, p 154) has argued that "To the extent that the clarity with which the results can be interpreted should be a criterion in

selecting any measurement technique, the difficulties inherent in the residual deflation (i e, *double deflation*) method constitute a strong argument in favour of the alternative familiar approach to real national product directly from the expenditure side" (italics are our addition) After closely examining the distinct possibility of obtaining negative real value added with double deflation method, when the nominal value added is positive, David (1962, p 154) comes to the conclusion that the effects of changes in production techniques upon estimates derived by the residual method seriously hamper interpretation of aggregate and particularly industry CDVA estimates' (CDVA = constant dollar value added) Sims (1969 p 471) had also recognised this point explicitly when he stated 'double deflation is invalid in the presence of technical change of most sorts But if technical change has any form other than this purely 'value added augmenting' form the double deflation method breaks down

BP (1995) failed to appreciate that the numerical illustration provided by us in our comment (*EPW* December 31 1994 Tables 4 and 5) was a case where the double deflation method would break down On the contrary they have quoted Sims (1969) to defend their position[1] The most important limitation of the double deflation method according to Sims (1969) is that it is based on the assumption of separable production function between value added and materials which in turn implies a zero substitution between the two Sims (1969) argued that only under this assumption the notion of real value added made any sense and that the cases in which the double deflation method would break down invariably violated this assumption However Bruno (1984) whose framework was largely adopted by BP (1994) found this elasticity of substitution to be significantly different from zero (and insignificantly different from unity) in several of the developed economies considered in his study Thus the real world situation does not appear to support the separability assumption It is widely acknowledged that most types of technical progress would not satisfy such a strong condition Given these well established theoretical as well as empirical findings in the available literature on the subject it is just not possible to agree with BP (1994) argument that in order to estimate the extent of technical progress, the real value added should be measured through the double deflation method, which is itself rendered invalid in the presence of the very phenomenon

Bruno (1984) clearly pointed out the measurement bias of the double deflation method indicating that the double deflated value added would understate the growth of real value added (or net output) with monotonic changes in the relative material prices. He further showed that this bias would disappear only if (i) relative material prices are fixed, or (ii) elasticity of substitution between materials and value added is zero Since these conditions are not likely to be fulfilled in reality, taking some plausible values of the parameters involved, he came to the conclusion that double deflation would involve considerable errors in the productivity growth measurements (see Bruno 1984, p 26) BP (1995) tried to defend their position by again quoting a footnote from Bruno (1984) which states that the bias can be eliminated when double deflation is done with a continuously shifting base year' This again is practically non feasible As an alternative BP (1995) repeated their exercise with a change in the base year from 1970-71 to 1980 81 In their reply [BP 1995] they again reported those results already reported in their original paper [BP 1994 Table 3] Such an exercise in no way removes or even reduces the measurement bias particularly when the series is prepared not by shifting the base year but by independently considering an alternative base year

Moreover it is important to note that the measurement bias of the double deflation as pointed out by Bruno (1984) assumes presence of no errors in the price indices for inputs and outputs On the other hand when the input price index is known to be containing unknown margins of error arising not only out of the inappropriate base period weights but also their being held constant unnecessarily over time the use of double deflation with such inadequacies does not necessarily become a more efficient method of measuring the TFP growth The choice between single deflation and double deflation is essentially the one involving the lesser evil It is evident from the above discussion that the claim of BP (1994) that their estimate of TFP growth based on double deflation 'makes a distinct improvement over those measures that have been provided so far is clearly exaggerated and unconvincing In our opinion there is no conclusive evidence to suggest that the double deflation method represents a better method (as compared to the single deflation method) of measuring total factor productivity growth in Indian manufacturing sector during the last two decades

Notes

1 It may be noted here that BP (1994) have used factor shares at constant prices without any justification when the most acceptable and widely used practice to calculate TFP is to use the factor shares at current prices This could be a possible source of difference in their calculations and ours

2 We have used here the TFP series as calculated by BP (1995) based on the input price deflator implied by the weights for the registered manufacturing sector as estimated by us because we feel that it represents a better approximation than ignoring the data on product-mix by using the weights based on a combination of registered and unregistered manufacturing sectors for constructing the input price index meant for the use only in the registered manufacturing sector There is hardly any controversy here since BP (1995) also agree in principle with this

3 These results are available from the authors upon request

SCHEDULE 17

NOTES FORMING PART OF THE FINANCIAL STATEMENTS OF THE INDIAN BRANCHES FOR THE YEAR ENDED 31 MARCH 1995

1 The financial statements for the year ended 31 March 1995 reflect the results of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited ("the Bank"), which is incorporated and registered in Hong Kong The Bank's ultimate holding company is HSBC Holdings plc, which is incorporated and registered in England

2 Principal Accounting Policies

(a) General

The accompanying financial statements are prepared on the historical cost basis as modified by the revaluation of premises, and in accordance with generally accepted accounting principles and the statutory provisions and practices prevailing within the banking industry in India

(b) Transactions Involving Foreign Exchange

(i) Assets and liabilities denominated in foreign currencies are translated at the rates of exchange prevailing at the year end, except for those foreign currency non-resident deposits eligible for conversion with the Reserve Bank of India ('RBI'), which are translated at the notional rates applicable to these deposits Revenues and expenses are translated at the rates prevailing on the transaction date

(ii) Outstanding forward foreign exchange contracts are revalued at the forward exchange rate prevailing at the year end and the resultant gain or loss is included in the Profit and Loss Account

(c) Investments

(i) All investments are classified as "Current Investments" and are valued at the lower of cost and market value in aggregate by type of security

(ii) Cost represents the acquisition cost adjusted by the amortisation of premium or discount over the period from the date of purchase to the date of maturity

(iii) Market value is determined in accordance with the RBI circular DBOD No BP BC 44/21 04 048/95 dated 15 April 1995 Quoted investments are valued based on market quotations Unquoted investments are valued by reference to the yield to maturity as prescribed by the RBI

(d) Advances

Advances are stated net of provision for doubtful advances and interest in suspense Provision for doubtful advances is made in respect of identified advances based on a periodic review and in line with the provisioning guidelines issued by the RBI Interest on doubtful advances is credited to interest in suspense account and not recognised in the Profit and Loss Account until received

(e) Fixed Assets

(i) Fixed assets are stated at historical cost less accumulated depreciation, with the exception of premises which are stated at valuation or cost less accumulated depreciation

(ii) Depreciation is provided on the straight line basis at 2% per annum on Premises and 20% per annum on other fixed assets

(iii) Depreciation on the surplus on revaluation of fixed assets is charged to the Profit and Loss Account and a corresponding transfer is made from the Capital Reserve to the Profit and Loss Account

(f) Staff Benefits

(i) Provision for post-retirement benefits in respect of approved pension funds is made based on actuarial valuations conducted by a qualified actuary

(ii) Pension payments to staff who retired on or before 31 December 1980, prior to the creation of the approved pension funds, are accounted for on a cash basis The annual cost of this pension is Rs 3 million.

The Hongkong and Shanghai Banking Corporation Limited
(Incorporated in Hong Kong with limited liability)

(iii) Monthly payments made under the Voluntary Retirement Scheme introduced in 1991 are also accounted for on a cash basis The liability at 31 March 1995 in respect of this scheme is Rs 10 1 million, provision for which is not made in these financial statements

(g) Net Profit

The net profit disclosed in the Profit and Loss Account is after

(i) provision for any depreciation in the value of investments

(ii) provision for doubtful advances,

(iii) provision for taxation,

(iv) provision for other unusual and necessary expenses,

(v) charge for head office expenses

3 Fixed Assets

(a) The most recent valuation of the freehold and long leasehold premises was conducted by independent professional valuers in November 1992 and the results of the revaluation were included in the Balance Sheet at 31 March 1993

(b) Certain premises acquired under a Scheme of Arrangement are held in the name of Hongkong Bank (Agency) Private Limited a wholly owned subsidiary, for the benefit of the Bank Accordingly, these premises have been treated as assets of the Bank in these financial statements

4 Investments

Investments include securities of Rs 23,850,000 which have not been transferred to the Bank's name The Bank has filed an affidavit with the Custodian under the Special Court Ordinance, 1992 and awaits the Court's ruling In the opinion of management, these securities will be transferred into the Bank's name thereafter

5 Other Assets

The Bank holds a valid Banker's Receipt for 110,760 Canstock Units of face value Rs 100/- each which have not been physically delivered by the counterparty pending settlement of an unresolved issue, included under contingent liabilities, in respect of securities transactions with the same counterparty The units were redeemed during the year and the proceeds due on redemption are included in Other Assets pending settlement of the dispute In the previous year the asset was included in Investments

6 Securities Transactions

There are certain securities transactions currently in dispute with the Bank involving an aggregate sum (including interest) of Rs 331 3 million (Previous year – Rs 1,030 million) which are not acknowledged as debts by the Bank In addition, the consequential taxation implications of the above transactions remain unclear The Bank intends to defend itself against these claims vigorously On the basis of information and advice currently available, management does not anticipate any material loss to the Bank Provisions and contingencies includes payments totalling Rs 524 million in respect of prior years' securities transactions

7 Taxation

Tax liabilities in respect of Mercantile Bank Limited taken over by the Indian Branches are pending final outcome of the tax assessments/appeals filed by the Bank/Tax authorities relating to the assessment years 1967-68 to 1983-84 and those in respect of the Bank for assessment years 1984-85 to 1991-92 The amount of liability is not ascertainable In respect of assessment year 1992-93 there is a Contingent Liability of approximately Rs 293 million which is presently in appeal

8 Previous year's figures have been regrouped and reclassified as far as practicable and wherever necessary

Auditors' Report on the Financial Statements of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited under Section 30 of the Banking Regulation Act, 1949

We have audited the Balance Sheet of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited (incorporated in Hong Kong with limited liability) ("the Bank") at 31 March 1995 and the related Profit and Loss Account for the year then ended. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI of the Companies Act, 1956. The financial statements are therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In respect of the matters mentioned in notes 4 and 6 to the financial statements, we are unable to form an opinion on their outcome and consequently their effect, if any, on the results of the Bank for the year.

In our opinion, subject to the effect of the adjustments, if any, that might have become necessary had the outcome of the matters referred to in the previous paragraph been known, the financial statements give a true and fair view of the state of affairs of the Bank at 31 March 1995 and of its profit for the year then ended.

We further report that:

(a) the financial statements are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies;

(b) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books;

(c) the returns received from the branches of the Bank have been found adequate for the purposes of our audit;

(d) the transactions which have come to our notice have been within the powers of the Bank.

SCHEDULE OF NOTES ON ACCOUNTS FOR THE YEAR ENDED 31 MARCH 1995

Significant Accounting Policy – Fee income is accounted on an accrual basis

2. No provision has been made in these accounts for income tax for the year as also for the earlier years as the income of this Company belongs to The Hongkong and Shanghai Banking Corporation Limited, the holding company, as per the Scheme of arrangement approved by the Bombay High Court whereby the contractual obligation under the agreement dated 14 May 1929 with Mercantile Bank Limited has vested in The Hongkong and Shanghai Banking Corporation Limited
3. Contingent Liability in respect of taxation matters Rs 104,000 (previous year Rs 104,000)
4. Other additional information pursuant to the provisions of the paragraphs 3, 4C and 4D of Part II of Schedule VI of the Companies Act, 1956 has not been furnished as there are no particulars to be given

Trusteeship fees include Rs 30,000 (previous year Rs 30,000) in respect of companies where trust deeds are yet to be executed
Earnings in foreign exchange – Fees Rs Nil (previous year Rs 10,162)
The Company is in the process of running down the Trusteeship business as it is not remunerative The Securities and Exchange Board of India (SEBI) has permitted the Company to continue with the existing Debenture Trusteeships until maturity, though the Company has not been registered as a Debenture Trustee under the SEBI regulations The Company has decided not to accept any new Debenture Trusteeships as directed by SEBI
Previous years figures have been regrouped wherever necessary.

AUDITORS' REPORT TO THE MEMBERS OF HONGKONG BANK (AGENCY) PRIVATE LIMITED

1. We report that we have audited the Balance Sheet of Hongkong Bank (Agency) Private Limited as at March 31 1995 and the relative Profit and Loss Account for the year ended on that date, both of which we have signed under reference to this report.
2. In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and the Profit and Loss Account together with the notes thereon, give in the prescribed manner, the information required by the Companies Act, 1956 and also give respectively, a true and fair view of the state of the Company's affairs as at March 31 1995 and its profit for the year ended on that date.
3. We have obtained all the information and explanations which to the best of our knowledge and belief, were necessary for our audit. In our opinion, proper books of account have been kept as required by law so far as appears from our examination of the books and the abovementioned accounts are in agreement therewith.
4. The Company is engaged in the business of supplying and rendering services. Accordingly, as required by the Manufacturing and Other Companies (Auditor's Report) Order 1988 dated September 7 1988 and issued by the Central Government and on the basis of such checks as we considered appropriate and according to the information and explanations given to us, we further report that:
   - i. The Company has not taken any loans secured or unsecured from companies, firms or other parties listed in the register maintained under section 301 of the Companies Act, 1956 and/or from the companies under the same management as defined under sub-section (1B) of section 370 of the Companies Act, 1956.
   - ii. The Company has not granted any loans secured or unsecured, to companies, firms or other parties listed in the register maintained under section 301 and/or to companies under the same management as defined under sub-section (1B) of section 370 of the Companies Act, 1956.
   - iii. The Company has not granted any loans or advances in the nature of loans.
   - iv. The Company has not accepted any deposits from the public.
   - v. In our opinion, there is a system of internal control commensurate with the size of the Company and the nature of its business.
   - vi. The paid-up capital of the Company at the commencement of the financial year did not exceed Rs 25 lacs or the average annual turnover for a period of three consecutive financial years immediately preceding the financial year did not exceed Rs 2 crores and as such we are not commenting on its internal audit system.
   - vii. On the last day of the financial year, there was no amount outstanding in respect of undisputed income tax, wealth tax, sales tax, customs duty and excise duty which were due for more than six months from the date they became payable.
   - viii. During the course of our examination of the books of account carried out in accordance with the generally accepted auditing practices we have not come across any personal expenses which have been charged to Profit and Loss Account, nor have we been informed of such case by the management.
   - ix. The Company is not a sick industrial company within the meaning of clause (O) of Section 3(1) of The Sick Industrial Companies (Special Provisions) Act, 1985.
   - x. We have not reported on the matters contained in paragraph 4A(i) to (vi), (x) to (xii), (xiv), (xvi) to (xvii) in respect of fixed assets records and physical verification of fixed assets, revaluation of fixed assets, physical verification and valuation of inventories, internal control procedures relating to purchase and sale of goods, purchases and sales made in pursuance of contracts or arrangements entered in the register maintained under section 301 of the Companies Act, 1956, unserviceable or damaged stores and raw materials or finished goods, records for sale and disposal of realisable by products and scrap, cost records and provident fund and employees state insurance dues respectively as they are not applicable to the Company in respect of the financial year under audit.
   - xi. In view of the nature of services rendered by the Company, the matters specified in items (ii) to (iv) under paragraph 4(B) of the Order to the extent they relate to receipts, issues, consumption of materials and stores, allocation between materials and manhours consumed, stores and labour authorisation at proper levels are also not applicable.

The British Bank of the Middle East

(Incorporated in England by Royal Charter 1889)

SCHEDULE 17

NOTES FORMING PART OF THE FINANCIAL STATEMENTS FOR THE YEAR ENDED 31 MARCH 1995

1. The financial statements for the year ended 31 March 1995 reflect the results of the Indian Branches of The British Bank of the Middle East ("the Bank"), which is incorporated and registered in England. The Bank's ultimate holding company is HSBC Holdings plc, which is incorporated and registered in England.

2 Principal Accounting Policies

(a) General

The accompanying financial statements are prepared on the historical cost basis as modified by the revaluation of premises, and in accordance with generally accepted accounting principles and the statutory provisions and practices prevailing within the banking industry in India.

(b) Transactions involving Foreign Exchange

i) Assets and liabilities denominated in foreign currencies are translated at the rates of exchange prevailing at the year end, except for those foreign currency non-resident deposits eligible for conversion with the Reserve Bank of India ('RBI'), which are translated at the notional rates applicable to these deposits. Revenues and expenses are translated at the rates prevailing on the transaction date.

ii) Outstanding forward foreign exchange contracts are revalued at the forward exchange rate prevailing at the year end and the resultant gain or loss is included in the Profit and Loss Account.

(c) Investments

i) All investments are classified as "Current Investments" and are valued at the lower of cost and market value in aggregate by type of security.

ii) Cost represents the acquisition cost adjusted by the amortisation of premium or discount over the period from the date of purchase to the date of maturity.

iii) Market value is determined in accordance with RBI circular DBOD No. BP.BC 44/ 21.04.048/95 dated 15 April 1995. Quoted investments are valued based on market quotations. Unquoted investments are valued by reference to the yield to maturity as prescribed by the RBI.

(d) Advances

Advances are stated net of provision for doubtful advances and interest in suspense. Provision for doubtful advances is made in respect of identified advances based on a periodic review and after considering the provisioning guidelines issued by the RBI. Interest on doubtful advances is credited to interest in suspense account and not recognised in the Profit and Loss Account until received.

(e) Fixed Assets

i) Fixed assets are stated at historical cost less accumulated depreciation, with the exception of premises which are stated at valuation or cost less accumulated depreciation.

ii) Depreciation is provided on the straight line basis at 2% per annum on premises and 20% per annum on other fixed assets.

iii) Depreciation on the surplus on revaluation of fixed assets is charged to the Profit and Loss Account and a corresponding transfer is made from Capital Reserve to the Profit and Loss Account.

(f) Staff Benefits

i) Provision for post-retirement benefits in respect of approved pension funds is made based on actuarial valuation conducted by a qualified actuary.

ii) Pension payments to staff who retired on or before 31 December 1982, prior to the creation of the approved pension funds, are accounted for on a cash basis. The annual cost of this pension is Rs. 258,000.

iii) Monthly payments made under the Voluntary Retirement Scheme introduced in 1992 are also accounted for on a cash basis. The liability at 31 March 1995 in respect of this scheme is Rs. 3 million, provision for which is not made in these financial statements.

The British Bank of the Middle East

(Incorporated in England by Royal Charter 1889)

(g) Net Profit

The net profit disclosed in the Profit and Loss Account is after:

i) provision for any depreciation in the value of investments;
ii) provision for doubtful advances,
iii) provision for taxation;
iv) provision for other unusual and necessary expenses;
v) charge for head office expenses

3. Fixed Assets

The most recent valuation of the freehold premises was conducted by independent professional valuers in November 1992 and the results of the revaluation were included in the Balance Sheet as at 31 March 1993

4 Taxation

There is a contingent liability for assessment years 1991-92 and 1992-93 of approximately Rs 56 million which is presently in appeal

5. Foreign Currency Non Resident Deposit Scheme 'A' (FCNR 'A')

During the previous year the RBI conducted an inspection of the interest claims on FCNR 'A' deposit scheme made by the Bank for prior years, wherein it observed operational deficiencies in the interest calculation. Subsequently in June 1994 the RBI appointed external auditors to audit all FCNR 'A' transactions of the Bank and submit their report. No provision in respect of FCNR 'A' transactions is considered necessary by the Bank as the Bank does not expect any material liability to arise

6. Due to Head Office

Due to Head Office includes unremitted head office charges relating to prior years of Rs 66 59 million which is not repatriable as the Bank has treated it as part of its Tier I capital

The British Bank of the Middle East

(Incorporated in England by Royal Charter 1889)

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS OF THE INDIAN BRANCHES OF THE BRITISH BANK OF THE MIDDLE EAST UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949.

We have audited the Balance Sheet of the Indian Branches of The British Bank of the Middle East (incorporated in England by Royal Charter 1889) ("the Bank") as at 31 March 1995 and the related Profit and Loss Account for the year then ended. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI of the Companies Act, 1956. The financial statements are therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the financial statements give a true and fair view of the state of affairs of the Bank as at 31 March 1995 and of its profits for the year then ended.

We further report that:

a) the financial statements are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies;

b) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books;

c) the returns received from the branch of the Bank have been found adequate for the purposes of our audit;

d) the transactions which have come to our notice have been within the powers of the Bank.

WHAT ARE FOUR YEARS IN A NATION'S LIFE?

A page in history !

If these four years bring about a remarkable turnaround in economy loosening of shackles through liberalisation and giving more than equal status to the underprivileged

It was

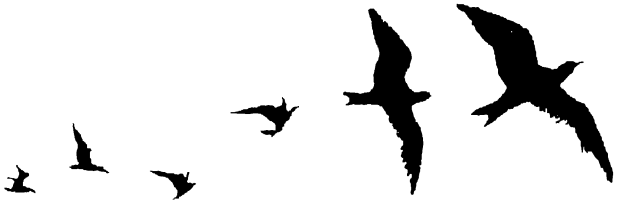
June 1991

Falling farm output
Poor Industrial growth
Declining exports
Depleted foreign exchange
Inability to manage external payments
Country's gold mortgaged to a foreign bank
Political uncertainty
Country on the brink of bankruptcy

It is

June 1995

- Economy opens up fresh investments flow into many sectors power telecom petroleum steel food processing
- Foodgrains production touches 186 million tonnes an all time high
- Revamped Public Distribution System in far flung remote and hilly areas introduced in1992 — operates in 1775 blocks
- Farmers get more remunerative price for their produce Fertilizer subsidy continues
- Exports reach a new high of Rs 92 338 crore in 1994 95 — now finance over 90% of imports
- Economic growth creates more jobs 6 million new jobs created every year
- JRY generates over 5,670 million mandays
- Employment Assurance Scheme provides jobs to over 14 million people
- Wastelands Development Programme to cover 23 thousand hectares
- Panchayati Raj Act brought into force to strengthen democracy at the village level
- Rs 682 crores for welfare of Handloom Weavers
- Mahila Samriddhi Yojana and Rashtriya Mahila Kosh to help women empowerment



- Telephones to reach all villages in the country by 1997
- Satellite Money Order Service started
- Doordarshan network now available to over 726 million viewers
- AIR's regional programmes made available all over the country

Focus on Welfare of Weaker Sections

- 27% job reservation for OBCs in Central Government and Public Sector Undertakings
- National Commission for Safai Karamcharis set up
- National Minorities Development Finance Corporation and National Backward Classes Finance and Development Corporation set up

Striving for Peace and Harmony

- Peace and normalcy restored in Punjab and Assam
- Efforts to contain militancy and restore normalcy in Jammu and Kashmir continued

We enter the 5th year with a firm resolve to **fulfil people's rising** aspirations It is only a **vibrant nation** that aspires for things higher

From Green to Gold

The West Bengal agrarian reforms of the late 1970s were clearly grounded in an earlier history of peasant struggle To what extent has the government's emphasis on the implementation of sharecroppers' rights, land redistribution and sweeping local government reform contributed to agricultural growth and changes in the agrarian structure? What has been the impact of agricultural growth in the two Bengals on the livelihoods of poor rural people? **1862**

Water Scarcity and Earthquakes

The earthquake affected areas of Marathwada are suffering from an acute water shortage which is likely to get worse with time But this has less to do with changes caused by the earthquake than with distorted policies for rehabilitation of the victims and for groundwater use **1826**

For More Than Half the Sky

There is no doubt that the Indian women's movement has changed the terms of political discourse in the last two decades Today, however, this very change is affecting it in peculiar ways Debates being actively promoted twist the very premises and values on which the movement has been based with terms like empowerment, choice, reproductive freedom, spiritual autonomy, etc, being widely appropriated by forces inimical to the goals of the movement Can the movement ensure the continued existence of fora to mount pressure for intervention in favour of more equitable gender relations? **1869**

State Care for Children

While provisions under the Juvenile Justice Act, 1986 certainly provide definite short-term relief to needy children there is undue emphasis on custodial care and social control Is it possible to enlarge the scope of poverty alleviation programmes to include the care of needy children in a more humane way? **1833**

Monetarism and Globalisation

A large part of the current fiscal malaise stems from monetarist policies – in terms of steadily raising the rate of interest to absurd levels And since these incomes are essentially in the nature of rentier incomes, the result has been a rise of rentier incomes in the economy **1824**

Ecology and Culture

The current cultural approach which has dominated discussions on development models inevitably romanticises traditional/indigenous cultures A fundamental theoretical error is the parallel being drawn between ecology and culture **1846**

Vietnam and US

Twenty years after the end of the brutal Vietnam war, the country is struggling to find its feet, especially with regard to its extremely complicated, but important relationship with the US **1836**

Price too High

The Kochi backwaters in Kerala house a unique ecosystem which is today threatened by a development project designed to bring, among other things, a long sought after bridge linking the several isolated islands with the mainland **1831**

Employment Patterns

A closer look at the 1981 Census data on the employment patterns of the tribal population of Orissa reveals interesting features which have implications for policy formulation **1879**

Media and Politics

Investigative reports appearing in the US media recently revealing past atrocities by American allies and client states are an indication of the role of the free press in the practice of *realpolitik* **1838**

LETTERS TO EDITOR

New Politics

AMARESH MISRA s report 'Limits of OBC-Dalit Politics (June 10) has tried to present an objective view of the BSP-BJP alliance It is ironical that every commentator on the subject has failed to admire the kind of politics played by BSP leaders like Kanshiram and Mayavati Everyone seems to be frowning upon or lamenting that they have sought an alliance with the BJP This is politics of untouchability instead of allowing the former chief minister Mulayam Singh to play the game of horse trading and defection, the UP governor has allowed Mayavati to form the government When the BSP considers every political party as 'Manuvadi which seems logical why should Misra blame the BJP as solely representing the oppressors' Although I do not admire the BJP for certain acts let us appreciate that the future trend is taking us towards a coalition form of government as every party has disappointed the voters when they were in power The BJP is likely to be a crucial partner

Mahars as Landholders

THIS is a late response to the points raised by Gopal Guru in his review 'One Dimensional View of the Dalit Movement' (January 14) I saw the review only recently My comments pertain to the points raised by Guru and not to the book by Jayshree Gokhale under review

I agree with many of the points made by Guru with reference to the mahar elite, its formation and its role But he has made one assertion which I think is exaggerated Guru states that in the Nagpur region landholdings of the mahars are larger than those of the upper castes From our experience in Vidarbha, I do not think this is correct It is a fact that mahars in the Nagpur region as compared to mahars in other parts of the state, own more land It is also a fact that the mahar elite possesses substantial landholdings in the region and in particular villages mahar families own more land than the upper castes But on the whole the kunbis and telis are the main landholding castes (and in specific areas the pawars, malis kirads, etc) They are the dominant agricultural castes in rural Vidarbha including the Nagpur region Also even the old landed brahmin families have tried to retain important portions of their lands in the region

Another point that is significant in the context of Vidarbha is the relation of the dalit elite to the revolutionary movement that has developed among the tribals, especially the Gonds, in the past one decade While the poorer, militant dalits are drawn towards the revolutionary movement, the dalit political elite is extremely active in preventing any collaboration with the tribal movement Further, many senior government and police officers who are mahars are posted in this region As an influential section of the mahar elite, they are also involved in driving a wedge between the struggling tribals and the urban dalit masses, but this may often be out of a need to preserve their jobs, though not in all cases Definitely, the unity of the toiling masses and the growth of a wide democratic consciousness have suffered as a result

Pigeon Mail

I RECEIVED an airmail letter bearing a British postmark dated March 20 1995 on May 18 From the official notings on the cover it appears that the letter had arrived at the Calcutta foreign mail office not later than April 7 The inordinate delay in delivery totally vitiated the purpose of the urgent communication And for this great 'favour the post office charged and realised from me a sum of Rs 15 for some custom check

This, however, is not a stray case of postal vagary Some time ago my telephone bill was delivered to a wrong address I was able to make the payment in time only because a lady of that house had kindly telephoned me She also told me that she had been redirecting my wrongly delivered mail I have not, however, so far got any redirected mail For months I have not been getting *EPW* copies regularly Not only are the copies inordinately delayed but many issues do not arrive at all Some time ago the *EPW* office was kind enough to send me in a lot 10 consecutive missing issues by speed post Another Bombay-based friend also sent me a lot by courier service At the moment of writing this, on June 8, I have not got any *EPW* issue after the April 22 number

For my part, for all my important communications I avail myself of either speed post or the registered mail service

The postal services in my area, a newly developed township in north-east Calcutta (Bidhan Nagar or Salt Lake City) are particularly undependable Officially mail is delivered twice or thrice a week While the population of the area is growing fast, postal facilities – office space and manpower – are not Periodically, post offices are deluged with undelivered mail For years, I have been periodically making desperate complaints to the higher authorities, sometimes by telegram Earlier there was sometimes some response, followed by some improvement In recent times, there is neither response nor improvement This is obviously due to the new policy orientation at the top level Any relief is beyond the capacity of the local or medium level authorities Untrained postmen recruited as casual hands on paltry remuneration are put to work, leading to chaos and errors Basically all this is due to the diversion of huge resources to the telecommunication services catering to the privileged few, while starving the ordinary postal services catering to the common man

The Lok Sabha speaker in his wisdom guillotined the discussion of the postal budget and thus denied any opportunity for ventilating the common people's grievances – assuming of course that there was any MP interested in taking up cudgels on their behalf

ECONOMIC AND POLITICAL WEEKLY

Much Ado about Nothing

THE finance minister's intolerance of any criticism of the economic reform programme and any suggestion that its fruits may not have been as wholesome as claimed by him and his admirers is well known. So it is not surprising that he should have taken umbrage at the Planning Commission's mid-term appraisal of the Eighth Plan and prevailed upon the prime minister to put off the meeting of the full Planning Commission called to consider it on the 19th of this month. (Apparently this would have been the first such meeting of the Commission in nearly two years, which is some indication of how little use the government has had for the Planning Commission and the Commission's own failure to carve out a worthwhile role for itself in the post-reform context.)

Unfortunately for the finance minister, the Planning Commission's review of the Eighth Plan has come up at a time when he and the economic reform programme are very definitely on the defensive. It has come to be widely accepted, most importantly in the ranks of the Congress Party itself, that a large part of the blame for the severe reverses the party has suffered in the assembly elections in a number of states belongs to the economic reform policies and the hardships and privations they have caused to the large majority of the people. In its own terms too the reform programme has come to be discredited for a variety of reasons. Judged by whatever criterion – the fiscal deficit as a proportion of GDP, the size of the centre's revenue deficit, the rise in the government's debt and the interest burden thereon – the finance minister's efforts to restore a measure of order to the government's finances, which task was acknowledged to be the cornerstone of structural adjustment and economic reform, have, after much huffing and puffing, conclusively failed. The situation will get even more out of control in the next few months as the government sets about doling out large sums of money for so-called welfare schemes in a desperate attempt to salvage the ruling party's prospects in the coming elections to the Lok Sabha. That the reform programme has run out of steam is also indicated by the fact that for quite a while now no new policy initiatives, including in areas where the government has been repeatedly promising them, have been forthcoming. Finally, actual developments in crucial sectors of the economy, such as power, show that, contrary to the shibboleths of free competition, transparency and elimination of rent-seeking, it is business as usual more or less, with cosy deals involving gigantic projects being struck in total secrecy, giving rise to well-grounded suspicion of bribery and corruption.

Narasimha Rao, however, realises that anything, such as the Planning Commission's mid-term appraisal, which shows the economic reform policies in an unfavourable light will provide ammunition not only to the opposition parties but to his opponents in his own party and the breakaway Congress(T). So he was quite readily persuaded to cancel the scheduled Planning Commission meeting and to keep the Commission's appraisal document under wraps.

Judging by newspaper reports, the shortcomings in the performance of the economy in the first three years of the Eighth Plan highlighted by the Planning Commission's review – among them, the unlikelihood of the Plan's growth target of 5.6 per cent per annum being achieved in the light of the actual growth rates so far, large shortfalls in Plan outlay at both the central and state levels, slow-down in public investment, poor performance of the infrastructure and social sectors and danger of a deterioration of the balance of payments on account of rapid growth of imports – have all been by and large well known. What is noteworthy, and highlights a major weakness of the government's economic reform in terms of its relative one-dimensionality, is that the review should have so offended the finance ministry particularly. Partly, of course, this has to do with personalities. It is no secret that from the time of the constitution of the Narasimha Rao government, the deputy chairman of the Planning Commission, who was first commerce minister but in a recent cabinet reshuffle was persuaded to very reluctantly accept the external affairs portfolio, has had his eye on the finance minister's job. As far as the finance minister is concerned, therefore, this lends a special edge to any criticism of the performance of the economy coming from the Planning Commission. But what is more important is that economic reform in India has been from the very beginning so completely the finance ministry's business. The focus of reform, its be-all and end-all, has, therefore, been almost exclusively matters which fall within the purview of the finance ministry. The commerce ministry may have had something to do in the easing of import regulations, but even here the lowering of import tariffs has been crucial. The ministries and departments of the government supposedly dealing with the real sectors of the economy have had virtually no role to play. And most conspicuous in its redundancy has been the Planning Commission itself. Ordinarily the Commission should have been the body to have provided vital inputs for the reform process in terms of conceptualising the objectives and modalities of an effective role for the government in the changed context and working out the structure of regulatory bodies to lay down and enforce the basic ground-rules for economic agents operating in a free market environment. Unfortunately, it has never looked as if the Commission ever wanted to even begin to move in these directions. As a result,

it has had no contribution at all to make towards, for instance, defining the terms of entry of foreign investment into a vital sector such as power - the lack of definition of which is certain to cost the country dear in terms of gold-plated power projects on the one hand and attrition of the indigenous power equipment industry and capabilities on the other

Judged against this colossal failure the Commission's Eighth Plan review recounting some known facts about the recent performance of the economy, for all the publicity it has received, is of little consequence Before the meeting of the Commission fixed for the 19th was cancelled it was reported that the meeting would, apart from considering the mid term appraisal, also discuss issues concerning the Planning Commission's future role and its restructuring in the context of the economic reforms It says much about the quality of leadership that the Commission has had that it should have taken it some four years after the institution of the reforms to realise the need to begin to talk of these matters

FOREIGN EXCHANGE MARKET

Thin End of the Wedge

THE Reserve Bank committee on the foreign exchange market has made far reaching recommendations which, if implemented, would make the market an exchange dealers' paradise One at least of the recommendations, which calls for detailed examination does not even entirely pertain to the terms of reference of the committee This is the one urging the setting up of offshore banking units (OBUs)

Offshore banking operations in different parts of the world – the primary full service centres of the advanced markets of London, New York and Tokyo the secondary collection or funding centres of the Caribbean, the Asia-Pacific and west Asia and the brass-plate or tax haven varieties which are there in some island economies bring out a range of objectives and motivations IMF and BIS data show that London is by far the largest international banking centre with 425 foreign banks and total assets of over $ 1 trillion Despite the loss of massive Euro currency transactions to the London market both the US and Japan have opposed the setting up of anything like an international offshore banking centre in their respective territories Even the international banking facilities (IBFs) set up in New York in 1981 and the Japanese offshore market in Tokyo set up in 1986 have been restrictive in their conception and operation even though data on BIS reporting banks show that nearly 40 per cent of all country assets and liabilities belong to US and Japanese banks Even now the US (which is an aggressive advocate of globalisation of financial markets for the rest of the world) and Japan refuse to allow full integration of their offshore and domestic markets for fear of the disruption this could cause to their domestic financial systems

The debate in Japan over the Tokyo offshore market has important lessons for us Serious discussion on the subject began in Japan when Singapore paved the way for the establishment of the Asian dollar market by abolishing the withholding tax on interest incomes of non residents and permitted the Bank of America to operate as the first Asian Clearing Unit (ACU) in November 1968 On a balance of considerations, the setting up of even a restricted centre in Tokyo (similar to the OBU concept now proposed here) was not favoured on the ground that what was true for an entrepot trading centre like Singapore with practically no natural resources and limited manufacturing activity did not hold good for Japan Even a limited centre it was felt, could be the thin end of the wedge threatening domestic financial stability Financial activities by themselves, it was recognised, could not contribute much to domestic welfare in large countries It was only much later under US pressure to internationalise the yen and open up the Japanese financial system, that the Tokyo offshore market came to be established in September 1985 The Japanese government had then made it clear that the model of the London market which adopts a unified approach to domestic and foreign transactions was unacceptable to Japan Instead, a system similar to the IBFs of New York, with an offshore market transacting only foreign-to foreign deals was allowed to be established The offshore banking activities in New York and Tokyo were essentially meant to divert a part of the business of the respective home-country multinationals from London and from regional offshore centres like the Cayman Islands and Hong Kong Hence the Tokyo and New York offshore financial centres are not regarded as international OFCs even though, because of the massive funds owned by the Japanese banks overseas, the Tokyo offshore market had attracted some $ 574 billion in external assets by the end of 1994 and the New York market some $ 246 billion These figures have to be set against the foreign currency position of banks in the UK of $ 1,094 billion

As for the other regional offshore centres, most of them have come up because of the narrow base of the local economies They have prospered because of their location near a large country or in regions with large foreign exchange surpluses The examples are Singapore with South East Asia, Hong Kong with Japan and China, Luxembourg with Germany and France and Bahrain in the Gulf The paper centres or tax havens which provide a regulation-free environment are a class by themselves They are used by corporate bodies and individuals to evade taxes and to register corporate entities, holding companies, trusts, and funds at low cost, free from the scrutiny of the respective home authorities Their importance has been on the wane, however Regional financial centres like the Bahamas and Bahrain have also lost their importance after the oil surpluses disappeared and the general process of liberalisation of financial markets gathered momentum accompanied by vast improvements in information and communication technology Other than London, New York and Tokyo, the only major centres which are thriving - because of their access to large surplus funds – are Hong Kong (assets worth $ 615 billion in December 1994), Cayman Islands ($ 432 billion) Luxembourg ($ 391 billion) and Singapore ($ 363 billion)

The RBI committee could claim that it has recognised that in the case of a country like India with only an emerging exchange market, total financial integration with the international market could prove destabilising and that it has therefore recommended the setting up of only OBUs and not a full-fledged offshore banking centre But the fact is that the OBUs are likely to be no less destabilising, for it is not the physical presence of offshore banks so much as the nature of the permitted dealings which can cause destabilisation A full-fledged offshore banking and financial centre such as Singapore allows physical location of offshore licence banks (Singapore hosts some 200 such) authorised to transact wholesale banking business with non-residents, it also allows what are called mere banking units Singapore's Asian currency units (ACUs), on the other hand like the New York and Tokyo offshore market systems, are of the limited variety A banking unit is a book keeping entity that is allowed to carry on banking business with non-residents by merely keeping separate books of accounts and segregating transactions with the country's residents

The OBU in the RBI committee's view, is a low cost option as only minimal investment in real estate will be required On the other hand, a range of benefits are expected to flow, such as increase in skilled employment (both direct and through the multiplier effect), training in valuable skills and exposure to international banking, wider range of services to exporters, importers and investors and access to world class infrastructure and transfer of the latest banking technology on an ongoing basis The OBUs will accept deposits and loans in foreign currency, they will also issue foreign currency certificates of deposits. The committee's scheme also envisages acceptance of deposits/loans from even such residents as are permitted to maintain foreign currency accounts, such as export earners' foreign currency (EEFC) accounts and resident foreign currency (RFC) accounts Apart from lending to non-residents, the OBUs will issue guarantees and do other business not involving the domestic currency and local exposure Taken together with committee's recommendation that exporters be allowed to retain their entire export earnings in foreign currency accounts with

banks in India, the implications of the proposed OBUs for the domestic economy are likely to be far-reaching

Banks, particularly international banks, are naturally very enthusiastic about integration of offshore and onshore operations, or at least permitting some 'seepage' between the two, so that the domestic segment can use the offshore market as a cheap source of funds to be deployed in the inter-bank market and generally lent to domestic borrowers This can, however, operate as a significant constraint on domestic monetary and financial policies and it is for this reason that the US and Japanese authorities have refused to allow full integration of the offshore and domestic markets What is more, experience has shown that even in well developed centres, separation of the domestic and offshore markets has been difficult to achieve and banks manage to surreptitiously channel cheap offshore funds into the domestic inter bank market for instance by transferring deposits taken on their offshore books to their branches and transferring them back as inter bank deposits free of withholding taxes and reserve requirements

The committee has as already noted recommended that export earnings should be allowed to be kept with offshore units on the argument that this would increase the availability of foreign currency funds which are free of reserve requirements so that liquidity and pricing of the funds will be relatively in line with international levels But for quite some years to come, the Indian economy will be short of domestic saving and permitting exporters to keep export earnings with the OBUs will adversely affect domestic liquidity and loosen monetary control The committee has also recommended exemption of inter bank borrowing from total demand and time liabilities for CRR and SLR purposes Banks are also to be allowed to lend invest and borrow short term funds up to six months at market rates in the overseas markets With this the domestic financial system is likely to be almost totally exposed to international exchange market influences and to large scale arbitrage operations and the scope for an independent monetary policy will be adversely affected

Further the notion that the OBUs operations will be low cost is likely to prove baseless The opportunity cost of various tax concessions and exemptions from domestic laws is likely to turn out to be very high The OBUs' liabilities are to be exempt from CRR and SLR requirements, they are to be charged to income tax at low rates not exceeding 10 per cent, no withholding tax is to be realised from non-residents and the instruments used by the OBUs are to be exempt from stamp duty While some exposure to sophisticated international banking and some skill development may take place, the gains will be minuscule compared to the costs, especially the intangible cost in terms of loss of autonomy in the pursuit of independent monetary, fiscal and other macro-economic policies For a large country like India which is yet to generate enough domestic saving and consequently any worthwhile surplus on the current account, such blanket deregulation and integration with the international financial markets will have serious repercussions in terms of hindering self-sustained and stable growth

The proposed OBUs will also expose the balance sheets of the parent banking companies to the vagaries of international banking The OBUs are not to be separate corporate bodies with independent capital bases They may have to adhere to some capital adequacy norms, but the legal ownership of the assets and liabilities will vest with the parent bank which will have to absorb the shocks bad debts, low earnings and even large losses – emanating from the offshore unit's activities

Finally, the system of supervision for banks and other financial intermediaries is known to be very fragile as it is and permitting cross dealings between offshore and domestic banking units will open up vast possibilities of arbitraging and risk exposure The conventional prescriptions of capital adequacy and exposure norms, accounting standards and gap limits will hardly suffice as exposures get magnified when offshore and domestic dealings get linked In any event, the task of harnessing the financial system to the pursuit of social objectives cannot be left to prudential norms and the supervisory system alone, these have to be buttressed by definite policy intervention and there cannot be any doubt that the RBI committee's recommendations will seriously hamper such intervention

MEDICAL RESEARCH

Credibility at Stake

BEER is consumed regularly by a tiny fraction of the small proportion of the population which can afford such processed drinks There are 33 beer manufacturing units in the country producing about three lakh kilo litres and all of them so far are wholly-owned Indian enterprises Not so long ago the government approved six NRI proposals for setting up units with 100 per cent foreign equity In short, beer is neither a mass consumption drink, nor is it a major manufacturing activity

And yet the National Institute of Nutrition (NIN) has considered it fit to devote precious time and resources (in terms of scientific personnel and presumably, finance and infrastructure) to study the composition of brewed beer, with special reference to a cancer-causing agent A recent report in a technical journal reveals that Indian beer contains a very high percentage of the cancer-causing agent nitroso dimethyl amine (NDMA) While the international norm for NDMA is one part per billion, Indian beer contains 3 6 parts per billion Further, beers brewed in the southern part of the country contain more of the carcinogenic component than other beers The two NIN researchers have arrived at this conclusion after testing 25 brands using 120 samples

Quite apart from the nature of the study itself, the question that arises here is about the choice of research pursued by a national institution reportedly strapped for funds to such an extent that ongoing research projects are being wound up or cut down All ICMR research institutions, of which NIN is one, follow a procedure of prioritising research before funds are allocated It is beyond the ken of possibility that a research proposal for studying the content of beer should have been approved as an internally-funded priority research project, especially when central funds for medical research have been falling in real terms The only conclusion one can draw is that the research study was funded by outside sources and so was given the green signal Clearly, the Indian beer industry, the largest unit of which is the Mallya group which runs its own research programme, is not likely to have sponsored the research

But even if this were a sponsored project, the ICMR (and presumably other allied institutions) has followed, in its early decades at least, a policy of reviewing every sponsored proposal for its relevance And for this structures such as the scientific advisory board and its constituents have been put in place If therefore a research proposal has got through these review processes then it obviously has the blessings of those who control the policies and programmes of the research institution This is indeed a come down for a research institution which in a sense, predates the ICMR and has pioneered some of the earliest studies in the area of nutrition at a time when the area itself was only just being defined internationally Its early anaemia studies were path-breaking as were those on Indian foods The NIN has housed and nurtured some of the best scientific talent in the field This is notwithstanding the fact that some of its later studies have been commented upon as having limited perspectives with an increasing tendency towards 'medicalising' problems and therefore emphasising laboratory-based analyses without giving due weightage to external factors The beer study is questionable research not only in terms of its relevance but also, it would appear, its scientific validity While the methods of analysing the material may not be questionable the scientists' attempt to relate the higher incidence of stomach cancer, as per the Indian cancer registry data, in Madras (against the northern parts of the country) to the higher content of carcinogen in south Indian beer is a shoddy and unethical piece of research These are not only two separate sets of data, gathered differently for different purposes, but the conclusion mitigates against all principles of research on incidence of disease All cancers have a number of causes and

motivating reasons; and while there are primary reasons for each, the effect does not manifest itself in the absence of other factors. This is true also of stomach cancer. Moreover, the researchers have made no attempt to separate out beer drinkers among those who had stomach cancer. Indeed it is surprising that the ethical committee of the NIN, if it functions at all, should have allowed this sort of research to be published. It is such an unscientific and irrational research products which mar the credibility of institutions whose work has earned international respect

What is happening in the NIN is not unfortunately confined to medical research With the attempts to make the CSIR industry-friendly, there is an even chance that more and more of Indian research will be market-oriented in support of producers who can pay, and scientific methods and ethics will fall by the wayside. Just as importantly, institutions like the NIN in which a great deal of public money has been invested will be increasingly used for shoddy 'market' research If this is not to happen, then these institutions must strengthen their research review processes and revitalise their ethical committees on a priority basis. For, it is possible to be industry-oriented, even while doing good research. But for that there has to be a well-grounded research policy with well-defined, people-oriented priorities.

UTTAR PRADESH

Growing Mandalisation

GIVEN its precarious hold over political power in UP, it is natural that the BSP should be making strenuous attempts to win over major segments of the population and widen its social support base. Now claiming to represent 'sarva samaj', instead of just 'bahujan samaj', a brahmin has been given a berth in Mayawati's council of ministers. And since Mulayam Singh continues to be the main contestant for the social base to which the BSP stakes its claim, efforts have been concentrated on eroding his influence. The creation of a new portfolio of minorities welfare and the announcement that the government favoured 15 per cent reservation for Muslims are intended to win over the Muslims and score a point over Mulayam Singh.

But Mayawati's dilemma is that her government depends on the support of the BJP to survive. The BJP is no doubt happy to see Mulayam Singh cut to size, but it can scarcely countenance what it regards as 'appeasement of the minorities'. Fortunately for the BSP, the Constitution has come to its aid – preferential treatment on grounds of religion is impermissible - and a confrontation with the BJP on this issue has been avoided, though the BSP has not been able to altogether avoid the impression of having succumbed to BJP pressure. Muslims of UP continue to nurse a sense of betrayal by the BSP for having turned to the BJP for support to bring down the Mulayam Singh government and catapult itself into power. A progressive section of Muslims, however, has acknowledged that the Mayawati government's order declaring 22 sub-castes of Muslims as being eligible for the benefits of reservation for backward castes is a step in the right direction. According to this view, the benefits will accrue to genuinely backward Muslims whereas the gains of a general reservation quota for Muslims would have been cornered by the better-off sections of the community.

If the BSP's effort to woo the Muslims has not met with much success, its attempt to gain the support of the yadavs by holding a 'vishal yadav' rally in Lucknow was hardly more fruitful Mulayam Singh hit back with a rally of his own at Azamgarh, which is reported to have attracted a far larger crowd, on the same day. Clearly, the BSP is going to find it difficult to loosen the yadav-Muslim combination which forms Mulayam Singh's political backbone. Further, the kurmis who, feeling neglected under Mulayam Singh's rule, had played an important role in bringing the BSP to power, have staged a revolt within the BSP camp in an attempt to assert their bargaining strength and extract the maximum benefits in preparation for the coming Lok Sabha elections.

The alliance with the BSP is not without its uneasy aspects for the BJP either. Though the BSP no more brands it as a 'manuwadi' or communal party, the BJP is not finding it easy to play its Hindutva card in a political landscape dominated by assertions of yadav, kurmi and gujjar identities In this context, the BJP may well decide to turn to the VHP's campaign to liberate the Kashi temple, which is to begin from October, as a weapon to counter the growing mandalisation of UP politics.

HEALTH CARE

Lax Monitoring

THE Food and Drug Administration (FDA) of Maharashtra, in consultation with the Drug Controller of India, closed down the Red Cross blood bank in Bombay earlier this month and cancelled its licence after investigating a complaint that blood supplied by it was contaminated with hepatitis B and HIV virus. While the FDA is apparently very pleased with itself, the entire episode makes it obvious that it has been inordinately lax with the enforcement of its own rules and regulations.

According to reports, a doctor working in the blood bank alerted the FDA about the mismanagement in the blood bank which had led to the supply of infected blood to several city hospitals for the last many years. The FDA then undertook investigations which led it to different hospitals, one of which acknowledged that blood supplied by the bank had been found to be HIV infected and had to be discarded. In its satisfaction over closing down the Red Cross blood bank, the FDA has done little to inquire into the silence of the hospitals which had received the blood, even if some of them did not give it to patients.

The Red Cross blood bank supplies blood mostly to private hospitals which do not have their own blood banks. The usual practice now is to obtain tested blood (instead of seeking donors for cases), because the testing of freshly-donated blood is a cumbersome procedure with the added requirement now of sending it for HIV testing to government-designated centres. There is invariably an acute shortage of blood, which makes for a growing black market. The recent events raise crucial questions about the responsibility of private hospitals not only towards their patients but to the general health care set-up. Clearly, even a large well known hospital, which knew that HIV infected blood had been supplied by the blood bank, did not see its responsibility extending to informing either the blood bank or the FDA. Such indifference is all of a piece with the current ethos in health care: while the customer has some claim to good service, the rest of the 'market' is nobody's responsibility.

The episode also draws attention once again to the functioning of the FDA. The FDA is charged with the task of ensuring that medical products, including blood and blood products, are manufactured and supplied as per the regulations on quality it has laid down. For blood products special regulations have been prescribed, and one would imagine that these would have required some extension of the monitoring mechanism as well. However, it has been clear for a long time that the FDA's functioning is riddled with inefficiency and corruption. The Lentin Commission set up after the tragic deaths due to contaminated glycerol in J J Hospital in Bombay had made trenchant observations on the functioning of the FDA. It had also made several recommendations, most of which have never been implemented, mainly because the long political reach of the FDA's petty officials has defeated all attempts to punish corrupt officials and repair loopholes in the rules which allow corrupt and unethical practices.

The mismanagement and gross negligence of the blood bank cannot be condoned. That it could, even after gross inefficiencies had been pointed out by its own officers, continue to supply infected blood is a blow to the institution and the credibility that it had gained in the many years it has been functioning.

None of these problems can however be dealt with in the absence of a reappraisal of the institutions set up to monitor health care in all its aspects. This includes not only the FDA, but such mechanisms as are required to be set up as part of the Nursing Homes Act which Maharashtra is among the few states to have passed and implemented. The restructuring of monitoring mechanisms is urgently required with increasing privatisation of health care.

BROOKE BOND LIPTON INDIA

Rapid Diversification

BROOKE BOND and Lipton India, the two subsidiaries of Unilever, were merged in July 1993 to form Brooke Bond Lipton India (BBLIL). The company increased its turnover to Rs 1,839 crore in the year ended December 1994 from Rs 1,303 crore in 1993, a rise of around 41 per cent. It posted a net profit of Rs 99 crore, up 26 per cent from Rs 78 crore in the previous year. Depreciation and interest costs rose by 69 per cent and 26 per cent, respectively. In view of the improved performance, the directors have declared a dividend of 50 per cent against 44.50 per cent for 1993.

The period 1993-95 has been one of mergers, acquisitions and alliances for Brooke Bond, beginning with the amalgamation of Tea Estates India and Doom Dooma, owned by Unilever, with Brooke Bond in January 1993. April 1993 saw the amalgamation of Kissan Products with the company In July 1993, the company purchased the marketing and distribution business of Dollops, the popular ice-cream brand, from Cadbury India. The company entered the market for desserts with the marketing of the famous Wall's brand in India in January 1993. Lipton India was amalgamated with the company in July 1993. Towards the end of 1994 and in early this year the company acquired the marketing and distribution assets of Kwality and Milkfood ice-cream.

The company's export turnover went up to Rs 216 crore, as a result of which it generated a net foreign exchange surplus of Rs 171 crore. Lipton India Exports, the company's subsidiary, increased its export earnings from Rs 98 crore to Rs 102 crore. The thrust was on high value-added packet and speciality teas. The company successfully marketed branded packet teas in Russia and Poland. The company says it has received continuous support in its export activities from Unilever, the parent company. Exports of the company are expected to get a boost with the commissioning of the company's 100 per cent export-oriented unit for instant tea powder at Etah in UP which is expected to go on stream by September this year.

Within the country the company, which has a 75 per cent share of the packet tea market, is stepping up operations to take advantage of the growing preference for packet teas across the country. The Indian market, by far the world's largest, consumes about 550 million kg of tea a year, of which about half is sold in packets. As a part of its marketing strategy, the company plans to rationalise its brands in order to consolidate its position. According to BBLIL's managing director, R Gopalkrishnan, this has become necessary in the face of the tough competition being offered by small tea companies and plantations. BBLIL has an estimated 35 brands of packet teas in the Indian market and there are some brands which exist at both the regional and national level and target the same clientele. Brands not doing well are to be withdrawn and only the top brands with universal appeal are to be retained. This strategy will be implemented in a phased manner over a period of four to five years. Gopalkrishnan emphasises, however, that the firm is not moving out of tea. "Our core business is still tea," he reiterates.

The company is currently selling two brands of coffee – Bru Instant, the instant coffee powder, which has been in the market for over 20 years, and Deluxe Green Label, the roasted coffee powder, which is around four years old. Coffee is the company's second largest business after tea and accounts for approximately 15 per cent of revenue compared to 60 per cent accounted for by tea. Last year the company's bottomline got a boost from its operations in coffee. The lower offtake of instant coffee and of roasted and ground coffee was compensated for by a sharp increase in the prices of coffee beans in the international and domestic markets.

BBLIL has diversified into other food areas such as Wall's range of frozen desserts and meal products such as Bird's Eye Green Valley frozen vegetables and Kissan fruit products. According to Manfred Oeschger, managing director of BBLIL, the slow growth of the tea industry has prompted the company to move into other areas where Unilever's expertise can be utilised. BBLIL has big plans in the food segment taking into consideration the changing environment in India. The company's annual report states that the foray into frozen desserts and vegetables has been encouraging in terms of market response. The Walls and Birds Eye Green Valley brands are also claimed to have gained wide consumer acceptance. A research and development centre for foods has been set up by the company at Bangalore to constantly upgrade its product lines.

The company is planning to promote new tea ventures in India and Nepal in the next two years. The idea is to expand the company's base rapidly, according to Satish Dhall, BBLIL's Doom Dooma tea division manager. The company is holding talks with the governments of the tea growing states in India and with the government of Nepal. The company aims to more than double the output of tea from the present 20 million kg to about 50 million kg. This expansion is in keeping with Unilever's global strategy and there are similar plans for Kenya, Tanzania, Malawi and Sri Lanka, India's competitors in the international market.

The company proposes to set up a tomato paste venture in Mysore at an estimated cost of Rs 40 crore to be commissioned in 1996. A joint venture is on the cards. The Japanese food giant, Ajinomoto Corp, has been holding talks with BBLIL among others for a 50:50 joint venture to manufacture its Ajinomoto brand of seasonings in India.

INDAL

Rise in Demand

The year 1994-95 was a good one for Indal, thanks to the spurt in aluminium prices coupled with rising demand. Equally important have been the company's efforts to reduce dependence on external power supply. The company, an associate of Alcan Aluminium of Canada, recorded a turnover of Rs 899 crore in the year ended March 1995, an increase of 26 per cent. Net profit rose by 80 per cent from Rs 51.08 crore to Rs 91 79 crore, despite a 73 per cent rise in depreciation provision, thanks to lower tax provision and reduced interest cost. Exports rose by 19 per cent, from Rs 121 crore to Rs 144 crore. South Africa and Vietnam were the new export markets developed by the company. Orissa Extrusions and Annapurna Foils, Indal's allied companies, performed satisfactorily. The directors have declared a dividend of 40 per cent and recommended the issue of bonus shares in the ratio of 1:2. Shareholders have reason to be happy as Indal is making a bonus issue after a gap of 17 years, after the last 2:5 bonus issue in 1977.

A diversified company, Indal manufactures aluminium sheets (foil, extrusion, metal and carbon) and chemicals and is also into electronics. The sheets division contributed 77 per cent to total turnover with chemicals and electronics contributing 19 per cent and 4 per cent, respectively.

Things brightened up for the aluminium industry in 1994-95 with the user industries coming out of the recession. Spurred by growth in demand, international price of aluminium shot up in 1994-95, aided by the resurgence of economic growth in the OECD countries. Domestic companies took advantage of this by linking domestic prices to the London Metal Exchange (LME) prices. This led to an increase in domestic prices. Reduction in excise duty by 5 per cent also contributed to improved margins. Further, a supply push born out of excess capacity helped the market to grow. Tapan Mitra,

(Rs lakh)

Indal's vice-chairman and managing director attributes 47 per cent of the rise in sales to volume growth, 27 per cent to increase in prices and the balance to 'enrichment of product mix'

The prospects for the aluminium industry are bright in India as a large number of new applications await entry into the domestic market Out of about 3,000 applications globally, only 300 have been introduced in the domestic market so far Increased application of aluminium in transport building and construction, packaging and general engineering is foreseen According to Joydeep Roy, secretary of the Aluminium Association of India, the industry is going to get a fillip with the global auto majors announcing their entry into India, as the use of aluminium in the automobile sector is rising fast In fact the maximum consumption of aluminium is by the automobile and construction industries which have been growing at rates of 20 per cent and 6 per cent respectively Growth of the power sector is also expected to boost demand for aluminium

Indal is gearing itself to meet the boom The company expects to meet 61 per cent of its total metal production in 1995 96 from its own smelters at Hirakud (Orissa) Alupuram (Kerala) and Belgaum (Karnataka) This compares well with 52 per cent in 1994 95 and 33 per cent in 1993 94 The company plans to add 10 000 tonnes of smelting capacity The aim is to go for increased backward integration and simultaneously move further down the chain of value addition

The company is planning a Rs 2 400 crore greenfield alumina project Jointly promoted by Indal the Tatas and Hydro Aluminium AS of Norway is a 100 per cent export oriented unit for the production of one million tonnes of alumina per annum the project will be located at Doragurha with a captive mine in Baphimali, 20 kms from Bhubaneshwar According to N K Choudhary chief executive the new company is to be known as Utkal Alumina International (UAIL) The operations of UAIL will conform to the environmental standards of Indal It will not require use or discharge of anode carbon fluoride salts and toxic chemicals Cost effectiveness, quality and environmental management will all be equally emphasised The plant will have an initial capacity of one million tonnes per annum, which will be raised to 3 million tonnes matching the world's largest alumina refinery at Gladstone, Australia with a capacity of 3 3 million tonnes

Indal is promoting a joint venture with Courtaulds Plc of UK to set up a foil-based laminated tube plant in Goa at cost of Rs 100 crore In partnership with Tata Industries and Norsk of Norway, Indal is also setting up a one million tonne per annum 100 per

cent export-oriented alumina plant in Koraput in Orissa, a district rich in bauxite, at an estimated cost of Rs 2,500 crore

The company's earlier diversification into financial services sector has not been successful and has ended with the company divesting its controlling stake in Infobase Finance According to Partho Dutta Indal's chief financial officer the reason for getting out of financial services was that 'it did not fit into the company s redefined group objectives' The aluminium giant has also shelved its proposed investment in the equity of International Advanced Process Technologies ending the planned diversification into edible oil de-odourisation equipment

India has the fourth largest reserve of bauxite in the world but is unable to cash in on this because of lack of power Further the thermal base of power makes its cost prohibitive The result is that aluminium companies are forced to export alumina and import aluminium In the process the country loses the opportunity to add value to the metal Many companies are trying to deal with this problem by going in for captive power generation In 1994 95 Indal s 67 5 mw Hirakud power plant achieved over 90 per cent PLF within a record time of 12 months of its commissioning This is the first power plant using clean coal combustion technology and met 83 per cent of the power requirement of the Hirakud smelter Another way to cope with the problem would be for the country to tie up with smelters in countries where power is relatively cheap Accordingly Indal is reported to be negotiating with countries in west Asia where power is relatively cheap for conversion of its alumina

GRASIM INDUSTRIES

New Projects

The flagship company of the Aditya Birla group Grasim Industries with diverse interests ranging from textiles and chemicals to viscose fibre and cement grew a slower pace in 1994 95 Turnover rose from Rs 2 202 crore to Rs 2 399 crore a rise of about 9 per cent compared to 20 per cent achieved in the two preceding years Even so, profits rose from Rs 228 crore to Rs 309 crore by around 35 per cent Accord ing to the company turnover and profits would have been higher but for a two month strike at the viscose staple fibre (VSF) division at Nagda in Gujarat The company has declared a dividend of 57 5 per cent on the enhanced capital of Rs 72 31 crore against 47 5 per cent for 1993-94

Production of VSF reached 1,58 674 tonnes in 1994 95 against 1 43,202 tonnes in the previous year Decline in cotton production pushed up demand for VSF, its closest substitute Prices of rayon wood pulp, an important input for VSF, also went up, but Grasim was insulated to a great extent against this price rise as it produces nearly 80 per cent of its requirements itself Lower raw material cost and higher finished product prices of the VSF division spruced up the company's bottomline Improvement in production and prices in the cement and sponge iron divisions also contributed their mite The company commands a 90 per cent share of the market for VSF and 56 per cent of that for wood pulp In cement it has a 4 5 per cent market share Cement contributes 19 per cent to the total sales of the company, with chemicals and textiles contributing 7 per cent and 13 per cent, respectively

Grasim's sponge iron division, Vikram Ispat, though commissioned only in March 1993 reported over 50 per cent capacity utilisation in 1994-95, producing 4 05,224 tonnes as against 91 006 tonnes in 1993-94 The fabrics division at Gwalior and Bhiwani reported normal growth The textile unit at Gwalior is ready to launch its ready made garments and men's fashion wear accessories The division is setting up a new unit called Vikram Woollens at Malanpur, near Gwalior with a capacity of 11 200 worsted spindles

The company has chosen VSF as a major thrust area for its future growth It is enhancing production capacity of VSF at Harihar in Karnataka and Mavoor in Kerala by 5 500 tpa and 11 000 tpa, respectively According to S K Saboo joint executive president, Grasim is the only producer of VSF in the world with its own know-how and technology and a full-fledged engineering division so as to be able to turn out plants for manufacturing pulp and VSF Grasim s plants at Harihar and Mavoor were fabricated entirely in house Another new plant at Gujarat with a capacity of 60,000 tpa will be commissioned in the latter half of 1996 at a cost of Rs 320 crore

Cement is another major thrust area for the company Two cement plants with a capacity of 1 million tonnes each in Madhya Pradesh and Rajasthan commenced production in March this year and are expected to add substantially to the income in the current year

The company is implementing a number of projects It proposes to set up an aromatics and chemicals complex in Mangalore, with a minimum investment of Rs 750 crore, and a one million tonne steel plant in Raigad district in Maharashtra through its steel division Vikram Ispat The steel plant will be a forward integration project for the company's eight lakh tonne hot-briquette iron (HBI) unit at Raigad Grasim and the Madhya Pradesh government have signed an MOU for setting up a 1,000 MW thermal power plant at Bina in Madhya Pradesh with an investment of Rs 5,000 crore

The company's VSF plants in Thailand and Indonesia are functioning satisfactorily According to company reports both the plants have undertaken expansion and the additional capacity will be commissioned shortly The company's carbon black plant in Thailand has been performing well and its capacity has been expanded The carbon black project in Egypt, a joint venture, has been commissioned on schedule and the plant has achieved commercial production of international quality

The company in collaboration with Birla Research Institute for Applied Science has developed an eco friendly process that eliminates the use of chemicals for the production of VSF The fibre produced by this process is being marketed under the brand name 'Grasi-Silk' and, according to company has been well received

CENTRE FOR STUDIES IN SOCIAL SCIENCES, CALCUTTA
requires for its collaborative ENRECA project a Post-Doctoral Fellow in Economics for a period of three years renewable every year on the basis of performance on a consolidated starting salary of Rs 5500/- per month plus contingency allowance for research purposes The candidates should have Ph.D degree in Economics and sound academic record with specialisation in Industrial Organisations, International Trade and/or Macro Economics. The candidate will be expected to travel on field trips as and when necessary Upper age limit is 35 years Applications with detailed curriculum vitae may be sent to the Registrar, Centre for Studies in Social Sciences, Calcutta, 10 Lake Terrace, Calcutta - 700 029 by **August 31, 1995.**

CURRENT STATISTICS

EPW Research Foundation

The inflation rate has dropped to 7 7 per cent in the week ended July 8, a new 20-month low. The rate of rise of the WPI has slowed down for all the major groups with the deceleration being particularly marked for primary and food articles. The rise in net RBI credit to the centre has touched Rs 15,882 crore in 1995-96 s far, against Rs 3,432 crore in the same period of 1994-95. Bank deposits and non-food advances have shown sizeable increases over the past month. Whil employment exchange data indicate niggardly growth of employment in the organised sector, data for a small sample of companies show actual decline in emplo ment in 1992-93 and 1993-94 More than 50 per cent of women employed in the organised sector are engaged in community, personal and social services

RANDOM REFLECTIONS

Monetarism to the Fore

Reflections on Rise of Rentier Incomes

Arun Ghosh

A large part of the current fiscal malaise stems from monetarist policies - in terms of steadily raising the rate of interest to absurd levels. And since interest incomes are essentially of the nature of rentier incomes, the monetarist policies have fostered the rise of rentier incomes in the economy.

THE *Economic Times* (Delhi) of June 27, 1995 had an important box item: "Reliance Industries has concluded a $ 150 million (Rs 473 crore) seven-year syndicated term facility with a consortium of banks led by the Union Bank of Switzerland. More importantly, the report indicated that 'the company has been able to secure a rate of 1 per cent over the London inter bank offered rate (LIBOR).

With LIBOR presently at 5.81 per cent, the interest works out to 6.81 per cent. 'Arrangers have fully underwritten the transaction without any guarantees from any bank or domestic financial institution.'

The above news item has a large number of implications, but before getting on to that theme, it would be appropriate to congratulate and compliment Reliance Industries at having achieved an international credit rating far, far higher than the sovereign independent Republic of India. Manmohan Singh, the much acclaimed finance minister of India, ought to hang his head in shame that a Swiss banker would show him the door were he to even attempt to borrow from the same Swiss banker say a couple of billion dollars to push through some badly delayed (and urgently needed) projects (e.g. in the power sector) – against the guarantees of the sovereign government of India – to moderate the future power shortages that are certain to arise as a result of the unimaginative (in fact, totally wrong) policy package that the power minister and he had cobbled together in 1991-92. India's power development programme has been in the doldrums over the past three/four years as a result. However, that is another story.

So kudos are due to Reliance Industries for having pulled off what may be described as a fantastic deal in a global market. However, one must note that this development also highlights certain disturbing features of the current policy package even in the area of financial reform. To these we must now focus our attention.

To begin with, the permission to borrow abroad liquid capital (for meeting domestic working capital needs) is given by the government of India selectively only to a few people, and for amounts determined by the finance ministry. This is ostensibly on balance of payments considerations, first, that we must not build up too large a liability by way of short term commercial credit, and secondly because any inflow of foreign exchange arising from such transactions would add to our foreign exchange reserves and increase the currency in circulation by an equivalent amount. But this policy then has several deeply disturbing consequences. First a few, a very few, large companies are with this facility being conferred an advantage over their rivals. Reliance Industries get their working capital at say 6.8 per cent interest. What do their rivals and competitors have to pay? The word in the market is that 17 per cent is the minimum that a large corporate entity has to pay to the banking sector for working capital credit. For small units the going rate of interest is 22 per cent up. For a poor handloom weaver or a farmer the banks would not lend at all and the going rate of interest in rural Punjab today is 5 per cent per month or 60 per cent per annum (in fact more if you compound the monthly payments).

So essentially a special favour has been shown to Reliance which would give this unit a sharp edge over all its competitors (including the IPCL). Of course public sector enterprise is *intended* to die out, but what about other private sector companies that have to compete against Reliance?

It can be argued that no other company can get the sort of terms that Reliance has got and if they can, they can also apply and go global. May be. But then, the government would then be in a dilemma: how many of them to approve and in what amounts? If permitted, the competitors of Reliance might be able to borrow at, say, 2 per cent above LIBOR, that would give them working capital at 7.8 per cent instead of 17 per cent (as the going domestic rate is). So, this partial and selective authorisation of the facility to borrow abroad leads to (a) an absurd type of discrimination as between different units in the private sector and (b) as a result, it opens up enormous opportunities for 'rent seeking' by those who are responsible for according such approvals. In fact, the finance minister personally has to approve each single borrower as well as the amount he can borrow.

This "rent seeking" need not be for personal benefit. For example Reliance may be asked to covertly finance a large part of the election expenses of the Congress Party (headed by Narasimha Rao) in the general elections which could be just eight months away.

Fortunately, the Indian masses have proved repeatedly that money alone does not win elections. Nevertheless, the 'rent seeking' opportunities are obvious, and the great votaries of the present policies need to note that such policies are illiberal in the extreme. Liberalisation in the true sense amounts to the abolition of all discretionary controls. Indeed that was the centrepiece of the recommendations of the Committee on Controls and Subsidies way back in 1979. (The present writer happened to be member secretary of that committee.) We now observe that we are passing on from one type of permit raj to another (and more lucrative) type. And the fact remains that the media, the financial media are gaga about the success of the policy of globalisation of which this successful borrowing is proof. The sad truth however, is that we have introduced in era of enormous favours to be conferred on a few parties in the name of economic reform/globalisation. And since the public enterprises are unable – for obvious reasons – to finance elections such favours must necessarily be conferred only on those private enterprises that are able to help finance Narasimha Rao (not even the Congress Party which is now deeply divided).

There is a second deeply disturbing consequence of such a policy. To the extent that the inflow of such capital would increase money supply the Reserve Bank of India would need to clamp down further on domestic credit policy. In other words it is not as if the advantage of those allowed to borrow abroad remains the difference between the rate of interest abroad and the current rate of interest in India. The rate of interest in India may have to be pushed up (in the name of controlling inflation), and indeed even the total credit supply curbed, if necessary through other means. In fact, the domestic rate of interest has already been hiked, and who knows what the RBI would do when the 'busy season' is on us in another four months. We have an efficient monetarist Reserve Bank governor. But, like Don Quixote, he is striking at windmills. He is attempting to shape monetary policy to make up for a weak fiscal policy for achieving macro-balance which should be attempted through fiscal policy. But this, unfortunately, is the IMF/WB credo. Monetary policy must

help to achieve a balance between aggregate demand and supply.

Let us face it. Industrial output in India is currently surging ahead, the latest growth rate in the index of industrial production being stated to be 9.8 per cent. With reasonable growth in agricultural production – note the mounting stocks of foodgrains with the FCI, and exports of both cereals and sugar by India lately – we still have an inflation rate of 8.5 to 9 per cent. (And, since the 'preliminary' figures are known to underestimate inflation by 1 per cent or so, the inference is that we are still having an inflation rate close to double digit figures.)

We set aside the totally one-sided 'financial reform' which leaves out in the cold the credit requirements of the vast majority of the producers in India. That is part of the policy package introduced since July 1991. But the trouble is that monetary policy is today imbued with fundamentally wrong monetarist theories.

It is to this general issue that we must now turn our attention, because the implications of this policy go very deep, and are part of the malaise that now afflicts our fiscal system.

Implications of 'Monetarism' and the Rate of Interest

In the 1980s, the Sukhamoy Chakravarty committee recommended that government borrowing from the Reserve Bank of India should be gradually converted to the 'market rate of interest'. The idea, at that point, was that this would discourage the government of India from having an open-ended facility for reserve money creation for its expenditures. However, instead of setting limits to such 'deficit financing', Sukhamoy Chakravarty was persuaded that the government was not entitled to an 'interest subsidy' at the cost of the banking sector, because, between the Cash Reserve Ratio (CRR) and the Statutory Liquidity Ratio (SLR), the banks were required to lend a high percentage of their deposits to the government (so as to be able to hold government securities to meet the CRR and SLR requirements).

So far so good; and the argument has validity. At this juncture, enter the World Bank/IMF with their monetarist persuasion. In a (capital short) developing economy, the rate of interest must be pegged high, ostensibly to promote labour-intensive investments. Experience shows that nothing of that sort happens anywhere; certainly, Indian experience belies this thesis. In fact, all that happens as a result of such unthinking monetarism is that investments for agricultural improvements, credit for small industries, for the artisan, the handloom weaver, et al, dry up.

The WB/IMF advice and pressure have led, over time, to a gradual raising of the rate of interest in this country. After the payments crisis of the summer of 1991, this became a part of the 'conditionalities' of the international bail-out of the government of India from an impending payments crisis. Indian policy-makers do not believe in relying on empirical data for formulating policies; *all* policies are cobbled together either on the basis of pressures (from diverse, important vested interests) or the downright compulsions of IMF/WB conditionalities.

Let us not go into *all* the conditionalities; again, that is a separate issue. A major element of IMF/WB philosophy is 'monetarism'; but the sad (and mistaken) belief of the monetarists is that interest rates are the best mediator of an equilibrium between aggregate demand and aggregate supply. Experience to the contrary of country after developing country is of no avail; textbooks on economics (written in the context of the industrially developed countries) say so. And even though Keynes exploded that myth even for developed countries as far back as 1936, did not the adoption of Keynesian policies by many developed country governments in the 1970s lead to 'stagflation'? Hence the emergence and supremacy of the monetarist philosophy of the latter day disciples of Milton Friedman. The net outcome is a gradual raising of the rate of interest. In India, the Bank Rate was 4 per cent in 1960-61. We need not go into the long tortuous history of the Bank Rate in India; suffice it to mention here that in 1980-81 the Bank Rate was 9 per cent; it was raised to 10 per cent in 1985-86 and to 12 per cent in 1991-92, the latter as part of the economic reform package. There have been diverse changes in the 'prescribed' lending rates by commercial banks; and very recently, even IDBI lending rates have gone up (effectively) to 17 per cent, while short-term loans (for working capital) are, as stated earlier, available at varying rates of interest. Leave out the very small concessional lending at 4 per cent, the bulk of producers today have to pay interest rates varying from 17 per cent to 22 per cent; the effective rate of interest from the indigenous moneylender is 60 per cent.

Forget the impact on the producers (and exporters who have to compete with producers abroad). What is the net impact of these policies on the fisc? According to reliable information – which, regrettably, is never made public – the average rate of interest on government of India borrowings has gone up (over the past few years) from some 6 per cent to 9.5 per cent.

Has the above monetarist policy helped to check government fiscal irresponsibility? The fact that government borrowing from the RBI is now at market rates of interest, tempts the government to borrow directly from the market. So, the internal public debt is going up by leaps and bounds, and so is interest payable on public debt, which is a 'committed expenditure'.

Let us now go into the matter a little carefully. The total debt of India, as of March 31, 1994 is stated to be Rs 4,71,619 crore (assuming Pakistan's liability of Rs 300 crore to be accepted by that country). If we take out the rupee value (as stated) of external debt, the total comes down to Rs 4,25,727 crore. This includes small savings loans, provident fund liabilities, etc.) We do *not* deduct capital investments – for which returns would be independent of the rate of interest payable on the loans incurred – but we could think of deducting the 'loans and advances' (by and large to the states) made by the centre, because the interest thereon (paid by the centre) would be offset by interest received from the states. So, we may deduct another Rs 1,49,435 crore, and we get an outstanding liability of Rs 2,76,292 crore (as on March 31, 1994)

Now, if the average interest rate goes up from 6 per cent to 9.5 per cent, the additional interest payment liability on this account would be Rs 9,670 crore. For a GNP (at market price) of Rs 6,95,342 crore in 1993-94, this amount is 1.4 per cent of the GNP.

In fact, we should *not* rule out the loans and advances to the states, since *their* interest payment liability adds to the overall deficit (for the country as a whole). For the full amount of Rs 4,25,727 crore of internal public debt, the additional interest payment liability resulting from an increase in the average rate of government borrowing from 6 per cent to 9 5 per cent works out to be 2.4 per cent of the GNP in 1993-94.

A large part of the fiscal malaise in India, therefore, stems from the 'monetarist' policies followed (in terms of steadily increasing the rate of interest to absurd levels). As per the budget for 1995-96, the gross interest payment is a whopping Rs 52,000 crore against expected revenue receipts of Rs 1,00,787 crore – as much as 51.2 per cent of the revenue receipts. This last statistic should make us sit up and consider where we are heading.

And since interest incomes are essentially (or at least largely) of the nature of 'rentier incomes', the monetarist policies of the government of India may be stated to have fostered and encouraged such 'rentier incomes'. Indeed, diverse other policies also indicate the same.

So apart from hampering production activity and making our exports less competitive, the pursuit of monetarism has gradually led to exactly the opposite of the result sought to be achieved. Instead of narrowing the fiscal deficit, it has in fact widened it.

But then, the financial destinies of this country are being decided uniquely by a few economists of international repute. The moral of the story is: if you want to be an internationally famous economist, you have to be a 'monetarist'. That the consequences (to the country) may be disastrous, is of course another matter.

COMMENTARY

Water Crisis in Earthquake-Affected Areas of Marathwada

G K Bhat
Aromar Revi

Water should have been a primary consideration while planning the redevelopment of the earthquake-hit region in Marathwada given that water crises are annual occurrences. Instead emphasis was given only to 'seismic' considerations in the rehabilitation programme This has inevitably led to a water scarcity which is likely to get worse

DRINKING water scarcity is becoming increasingly widespread in many parts of India, in spite of the achievements of the Water Technology Mission This is due to an increase in population pressure on an already scarce resource, along with gross access disparities heightened by retrograde state level 'public' policies and technologies that aid the resource-rich Is the drinking water scarcity in Marathwada earthquake-induced?

The Marathwada earthquake of September 30, 1993, of 6 4 magnitude on the Richter scale, was a shallow focus earthquake with its instrumental epicenter on the border of the Osmanabad and Latur districts of Maharashtra The impact of this disaster was primarily borne by a relatively small area, but the intensity of damage was high with official reports of over 8,000 killed and about 14,000 injured The loss of cattle was also high in some areas (see TARU's *Action Plan for Reconstruction in Earthquake Affected Region of Maharashtra*, 1993 and TISS *Survey of People Affected by Earthquake in Latur and Osmanabad Districts*, 1993)

The relief programme of the Maharashtra government effectively contained the spread of water-borne diseases that usually follow a major disaster This was done by comprehensive chlorination of open wells and the drilling of a number of deep borewells near the sites of emergency settlements This level of extraordinary' efficiency of the Public Health Emergency Department (PHED) and other departments slowly faded a few months after the disaster The situation in 1995 is that serious drinking water availability and contamination problems are being experienced in the area affecting over 1 5 lakh people

Marathwada has been a chronically drought prone area, but future drinking water needs were not critically evaluated in the Rs 1,100 crore World Bank supported relocation and rehabilitation programme The criticality of water availability in site selection for relocation, and technology choice was highlighted just after the earthquake in the TARU *Action Plan for Reconstruction in Earthquake-Affected Region of Maharashtra*, 1993 During subsequent longitudinal studies of the MEERP and interaction with local groups, it became apparent that water had indeed emerged as one of the main constraints in the rehabilitation process (see Samarthan's *Marathwada Earthquake Rehabilitation Status Report*, Bombay 1994, TARU's *Marathwada Earthquake Rehabilitation A Year Later* Delhi, 1994, TARU's *Planned Disaster Monitoring Earthquake Rehabilitation in Marathwada* Delhi, 1995)

The competing demands for water for irrigation cattle and drinking has severely constrained construction in cement concrete the dominant material being used there This is now cited by the state government as an important factor in the delay in meeting targets by the MEERP This however, detracts from the fundamental issue the increased vulnerability of the earthquake affected population due to 'policy' and 'technology' induced water scarcity This has increased community dependence on government support and subsidies as their asset base has either been wiped out or depleted during and after the earthquake This is in clear contradiction of stated public policy

Over the last four years, Marathwada has suffered from lower than normal rainfall (of roughly 800 mm) At the same time, intensive drilling and ground water withdrawal for agriculture, especially sugarcane, has resulted in the drying up of many drinking water sources like handpump based borewells These two factors have been responsible for the drought' in this region

Ground Water Politics

Expanding the area under sugarcane for sugar factories in this low rainfall region seems to be an ill conceived idea The much hoped for surface irrigation from Makni dam also seems to be a mirage especially with large demands for urban drinking water from the dam apart from nearly 50- 60 relocation villages with a human population of more than 1,25 000 and bovine population of roughly 60,000 This results in a conservative annual demand of more than 150 ha m for drinking and domestic consumption alone in the core area

Ground water politics has also led to the formation of an interest group which benefits from ground water development activities' rather than benefitifig the intended beneficiaries, the larger communities It is not a contradiction in the region to see a village which has green sugarcane fields extending to the horizon suffering from a drinking water shortage with many communities carrying more than 20 tonnes of water a day On the other hand tanker water supply has become so regular to some villages that they are called tanker villages Even when water is available near a village distant sources are utilised to add value to water by transport (Growing Agony Drought Stalks Maharashtra R Padmanabhan *Frontline* June 16 1995) During this process of transport and handling, bacterial contamination occurs which can cause severe outbreaks of waterborne diseases (Pradeep Kumar s *The Uttarkashi Earthquake A Health Perspective, Bhuwaneshwari Mahila Ashram Tehri Garhwal* 1995) More than 70 per cent of the villages with population of more than 500 households had overhead tank based water supply systems before the earthquake They were supposed to feed household taps but most were non-operational due to a host of reasons varying from unrepaired pumps dried borewells and pumps fitted at too shallow a depth

Almost all of Latur and Osmanabad districts lie in gently undulating terrain A few laterite topped hills are seen in the eastern sector (Ausa and Nilanga blocks) The black cotton soil filled valleys have groundwater under both watertable and confined conditions The shallow groundwater table was traditionally exploited by dug wells fitted with electrical pumpsets ranging in depth of less than 5 m to 15 m

The main crops grown in this area are millets oilseeds, pulses and sugarcane Even though this area is perpetually short of water during summer water intensive sugarcane farming has become a practice, especially near the Khillari sugar factory (TARU, ASAG and YUVA's, *Baseline Socio-Economic and Participatory Design Exercise in Earthquake Affected Areas of Maharashtra*, 1994)

Wherever water is available from borewells, farmers opt for low labour intensive sugarcane farming. Even where water availability is not certain, sugarcane is grown. This practice has resulted in considerable loss of sugarcane during rainfall deficit periods when irrigation is not available. The need for large amounts of green biomass to feed cattle may be responsible for this sugarcane preference, apart from economic returns. Better managed sugarcane fields yield up to 40 metric tonnes of biomass per ha while even failed crops produce more than six tonnes of biomass per ha. Since sugarcane productivity is almost totally dependent on groundwater availability, depletion of 'common property' stocks is the easiest route to profit with this quite remunerative crop.

The cropping pattern in Marathwada has shifted from rainfed coarse cereals (mainly millets and pulses) until the 1970s to sugarcane in the 1980s. The failure of borewells prompted people to grow more remunerative and less water demanding oil seed crops like sunflower. Grape cultivation is now gaining popularity due to its high returns and low water consumption. Grapes take around three years for the first yield and initial investment in land development and water management is high. Therefore, these crops are restricted to medium and large farmers who can afford to invest in a crop with a three year gestation period and who have an assured source of irrigation. Grapes need reliable but smaller amounts of water than sugarcane. Borewells are the main source of irrigation for this crop.

Prior to the earthquake, sunflower was commonly grown mainly on the uplands. This crop is low in water demand and matures in around four months. Two to three irrigations during critical periods can make sunflower mature well. Nevertheless, in 1995, large areas of this crop have failed due to a lack of sufficient moisture.

Water Scarcity and Conflicts

Prior to 1950 the Latur-Osmanabad region was mostly under rainfed food crops. The main water sources were rivers and shallow wells, from which a small amount of cultivated area could be irrigated. At present, limited evidence of these structures is seen, a few old wells with pulleys to draw water and tanks for cattle.

Since the 1960s considerable investments have been made in water management in the region. Major investments have gone into surface water management through small dams and canal systems. The Makni dam is the only medium-scale dam in this region. Along with surface water resource development, sugarcane cultivation was encouraged on a large scale. Setting up of the Khillari Sugar Factory to process sugarcane was one such move. As the Makni dam command area development could not fully satisfy the needs of the sugar factory, the cultivation of sugarcane through ground water resources was begun. The Makni dam and the sugar factory seem to have triggered the higher dependency on ground water for irrigation.

Surface water resources developed in the region are not utilised efficiently. Even the Makni dam command area is yet to be adequately developed. Political forces have influenced the use of surface water in a sub-optimal manner. The irrigation needs of the actual command areas are neglected. Pumping from the dam has been used to satisfy urban demand and sugarcane growers. This will eventually have a serious impact in the region, especially on those depending on the dam for drinking water. Conservation of water through cost-effective means is critical to meet the agriculture and drinking water needs of the region without serious conflict. Some of the dams built for irrigation are now extensively used for providing drinking water to urban areas. Conflicts are likely to arise in the not-too-distant future between farmers and urban users.

With the lowering of the water table on a large scale, especially in the valley areas surrounding the villages, the further deepening of existing borewells and the drilling of new deep borewells is only going to aggravate the problem of water scarcity, especially in low rainfall years.

Borewells were introduced in the early 1980s, but most extensively during the 1990s. They extract water from depths as great as 150 m. This technology has been largely responsible for the drying up of aquifers, especially when coupled with submersible pumpsets to supply the high water demanding crops like sugarcane.

In the late 1970s, the introduction of pneumatic rigs resulted in farmers opting for borewells and changing the cropping pattern from dryland rainfed crops to sugarcane, especially in the river valley areas. Deep wells and electrical pumpsets introduced earlier became redundant after the borewell-submersible pump technology was introduced into the region. Springs and shallow watertable dependent sources usually dried up due to rapid water extraction by these new technologies. At present even borewells are drying up at an alarming rate, resulting in widespread water shortages.

The farmer owned borewells are at least four to five times the number of government owned irrigation (drinking water) borewells. Farmers have developed a cost-effective, though short term, means of water exploration. Wherever they find a government (drinking-water) borewell with a high yield, irrigation borewells are drilled in the neighborhood. This 'competition' often results in the loss of yield in many drinking water wells. The 'common-sense' rules of safe distance from existing borewells are not practised in most cases.

Prior to the earthquake, borewells in upland areas were not common as they were situated at considerable distances from most settlements. The formation of temporary settlements and the government's programme of relocation of core villages to upland areas with shallow bed rock has resulted in the drilling of new borewells to meet drinking water and construction needs. Immediately after the earthquake, nearly 40 borewells were drilled over a 10-day period to provide drinking water to the temporary settlements. Most of these wells have yielded much more water than borewells in the already overexploited valley areas.

The government has also resorted to drilling deep borewells, up from the earlier 90 m to nearly 200 m. The continuous race between drilling and pumping technology and groundwater levels is likely to result in increased shortages in the near future as natural recharge may be low in deep aquifers.

The other constraint is the design of the UNICEF Mark II handpump. This can only

Table 2. Households per Handpump Used vs Water Quality

(Per cent)

Households per Handpump	Water Quality	
	Not Contaminated	Contaminated
<100	68	33
100-300	14	86
Only Submersible pumps		100
Total	23	77

Source TARU Primary Study, Sample base = 16 villages.

Table 1. Household Water Deficit across Size of Settlement (1995)

(Per cent)

Village Size Number of Households	Daily Household Water Deficit (litres)			
	Nil	<= 100	100-200	Total
<400	56	11	33	100
400-600	20	60	20	100
>600		50	50	100
Grand Total	38	31	31	100

Source: TARU Primary Study; Sample base = 17 villages

tap water from depths of around 30 m in field conditions. Many 90 m deep wells which are fitted with these pumps are hence unable to provide a continuous supply of water. Long queues can be seen in front of these intermittent hand pumps. It is not economical to fit submersible pumpsets in these wells unless the yields are more than around 2,500 lt per hour. A few hand pumps capable of drawing water from deeper levels are being tried out but the government of Maharashtra (GoM) maintenance crew complained of greater effort required to operate them. Two people are needed to operate these hand pumps.

Maharashtra passed the Ground Water Bill (1994) which controls the exploitation of ground water resources, but it has not been enforced in the state. Since the earthquake (as in the periods preceding it) there has been unrestricted exploitation of ground water and more than 1,000 new borewells have been drilled by the government for farmers.

Government Policy. Most villages with a population of more than 1,000 persons were already covered by piped water supply schemes before the earthquake. In these settlements, about 60 per cent of the connections were by private water taps. However, since their water sources have dried up, about 90 per cent of overhead tanks are dry for more than nine months of the year. Large investments in water supply infrastructure have now become redundant. Villages where water consumption had reached more than 40 lt per capita per day (lpcd) bear the brunt of water shortages.

In most villages with piped supply people have to depend on either handpumps or on tankers. Long queues with waiting periods of more than eight hours have resulted in wastage of considerable amount of human energy to meet basic water needs. Even in villages surrounded by green sugarcane fields, drinking water has to be transported from distances of more than 1 km.

Tanker supply now covers more than 150 villages in the area. Trucks are hired on contract at around Rs 15,000 per month plus fuel costs of Rs 2.25 per km. Bore wells are acquired by the government on the recommendation of the panchayat and sanctioning by the district collector. The borewell owner is paid Rs 50 per day which is now being increased to Rs 100 per day.

The tanker business is quite remunerative as a considerable portion of borewell owners also own tankers. Tankers are typically old trucks fitted with plastic tanks. The trucks are usually very old and poorly maintained. Breakdowns and punctures of old tyres commonly disrupt the water supply. The demand for tanker supply seems to be made by local 'interest groups' who are likely to benefit from tanker contracts. Village panchayats which are usually controlled by people with larger land holdings and means are also more likely to own more borewells.

Recipients of tanker water often complain of non availability of water due to breakdowns for more than a day. Tanks leak and spill all along the road and at least 300-400 lt are lost out of the total of 6,000 lt during transport. There seems to be no mechanism to monitor the supply of tanker water and maintain its regularity in the region. Fights for water and a veritable battle for supremacy over the tankers is a common sight in the area.

Tanker supply contracts can often be more remunerative and less risk prone than sugarcane cultivation. Over six months a truck/borewell water contract can fetch a minimum of Rs 1,00,000 with investment of around Rs 1,30,000 or a nearly 75 per cent recovery (institutional costs partly included). The transport distances range from 3 km to 9 km. Truck owners prefer to draw water from long distances as it provides additional incomes as overhead costs. There are cases where local sources have been offered but more distant sources were chosen for water supply.

After Earthquake

Even though there were many reports by the press and NGOs of the drying of wells and borewells after the earthquake no long term effects of drying up or increasing yield in wells seems to have occurred. A few wells have been consistently reported to have dried up especially near Khillari. Apart from this there are no substantial reports regarding changes in water level or yields due to the earthquake. This lays to rest the theory that the present drought is due to the earthquake. Construction activity has nevertheless suffered considerably in the core area largely because of competing demand for drinking and washing and the large amounts that are regularly required for curing concrete structures.

The most serious impact of the earthquake has been the decision to relocate over 50 settlements in the core damage area (*Rehabilitation Action Plan for Persons Affected by and Acquisition*, Earthquake Rehabilitation Cell, Government of Maharashtra, 1994) against the internationally accepted experience of in situ reconstruction (see Aromar Revi, *A Comparative Analysis of Process and Agency Effectiveness in Post Earthquake Rehabilitation in India*, IARU, 1995). This has not only meant the loss of water sources and water supply infrastructure but unsustainably high population pressures on sources on new sites. In effect, this has promoted concentration of populations around urban centres rather than dispersal around sustainable sources of water.

A drinking water survey was conducted by IARU to study the water crisis in detail in Marathwada. In April-May 1995, water availability and water quality were examined in 17 study villages spread across Latur and Osmanabad districts and villages of all earthquake damage categories. An outline questionnaire was used to elicit information on drinking water conditions, wells and borewells in the village area, existing sources of drinking water and water supply through tankers. The demand for domestic drinking water was estimated based on demographic information (locally elicited cross checked with Census 1991 data) and animal populations. As rapid survey techniques were used, water use estimates only provide accuracy in kilo litres per day (Klpd) level rather than exact figures of consumption and demand. An attempt was made to estimate water transport by various means ranging from bullock carts, bicycles and tractors to transport by jeeps and trucks. Quality of drinking water source was subjectively ascertained (as performed in most rapid WHO methods) on site.

Water demand was estimated for each of the sample villages based on average household size of five people and 40 lpcd consumption. This is a conservative estimate considering the large livestock population per household (more than 10 cattle). The drinking water supply deficit is high even with the use of the wells. All large villages (>600 households) face water deficit with 50 per cent of them getting more than 100 lt/household/day. In small villages (<400 households) 56 per cent of villages do not receive any tankage. Nearly 62 per cent of all sample villages face water shortage. This in turn despite large investments in drinking water supply systems, is astounding.

The surveyed 17 villages had a total of around 8,800 households. Based on the data collected the number of households which had to depend either on tankers or other wells outside the settlement was estimated.

The bulk (57 per cent) of the households depend on sources outside the settlement for water. Out of the total dependent households 25 per cent of such households are from large villages (>600 households), 17 per cent are from medium sized villages (400-600 households) and 15 per cent are from small villages. This also indicates that in all the large villages all households have to depend on external sources of water.

Hence they should be given priority in any future interventions. It may also be mentioned that most large villages have up hill overhead tank based water

distribution systems Most of these are not operational, thereby exposing their populations to the risk of water-borne diseases

Most large villages were provided with piped water supply with overhead tanks before the earthquake Half the sample villages, have overhead tanks and piped water supply Whereas all the villages with more than 600 households have such systems, 80 per cent of the villages with 400 600 households have piped water supply However, most of these piped systems (90 per cent) are not operational and the rest are providing water for 15 minutes to 1 hour/day Long queues of pots are seen in front of stand posts Even though private household taps were provided in these villages, none of them are operational and water is distributed through public standposts The drying up of water sources is the main problem that leads to the halting of supply to overhead tanks and private taps

Handpumps were introduced into this area in the late 1970s Most of the earlier borewells were shallow and use the UNICEF India Mark II pumps These pumps are capable of drawing water from depths less than 35 m Hence one can see many hand pumps with intermittent flow but these borewells are not really dry A member of the CoM maintenance team said that the lower head capacity of the Mark II pumps is the main cause for shortage of water in many of these wells The newer models of India handpump series do not have this problem but they are difficult to operate by one person

The survey indicated that only 69 per cent of the households were exclusively dependent on handpumps for water supply The number of households per handpump also increases with the size of the village In other words the smaller villages have more handpumps per person compared to larger villages In the case of shortages the larger villages take the brunt Also as the number of households per handpump is higher in larger villages the likelihood of their drying up is comparatively higher Consequently the establishment of a large number of larger settlements with a higher number of households per handpump can result in the total collapse of the handpump based drinking water supply system Submersible pumps, wherever installed for drinking water supply or irrigation, have led to the drying up of most handpumps in the vicinity

In 84 per cent of the sample villages more than half of the borewells have dried up However, the size of the settlement by and large seems to determine the percentage of dry borewells to total normally operational borewells Only 25 per cent of the villages with less than 400 households have half the borewells dried up In 50 per cent of villages with 400-600 households 50 to 75 per cent of borewells have dried up and in another 50 per cent of sample villages of this group more than 75 per cent of borewells have dried up In all villages with more than 600 households 50 to 75 per cent of borewells have dried up In 38 per cent of all the villages surveyed, more than 75 per cent of the borewells have dried up The load per borewell source has increased during the drought With almost all the open wells going dry borewells were the only local sources of water The shortage is more severe in large villages than in small villages

Borewells are the most important source of water in most villages The load per operational borewell in different sizes of villages was evaluated The number of households per operational borewell was calculated based on the village survey The larger the village size the greater the number of households per borewell and submersible pump In seven villages with more than 400 households all had more than 100 households dependent on operational borewell Given the local water regime this may lead to further rapid depletion of these systems

To evaluate change due to drying up of handpumps the additional number of households which will be distributed across the remaining operational handpumps was calculated The data when cross tabulated with the size of the settlements indicates that the maximum additional load is transferred in large villages Of the sampled villages 65 per cent have additional loads more than 50 households per handpump With average yield of handpumps of around 25 lt per minute (lpm) over the operational period of around 12 hours per day each can provide around 18 000 lt per day (lpd) This would meet water of 90 to 100 households at an average consumption of 40 lpcd An additional load of more than 50 households per borewell will cause severe shortages and resultant conflicts Such conflicts are regular in most villages and there are long queues of collection vessels in front of almost all handpumps especially in large villages

Tanker water supply is the last resort The supply through tankers does not ensure water availability and quality Survey information regarding water supply by tankers indicates that in small villages (<400 households) only 22 per cent had tanker based supply of up to 50 lt per household per day About 40 per cent of the medium sized villages got tanker supply of up to 50 lt per households per day In 50 per cent of large villages tanker supplied more than 50 lt per households per day. Around 30 per cent of all villages received tanker water supply

The government installed domestic water systems are not able to meet the needs of people Therefore, people have to collect water from private borewells and a few wells and dams situated up to 2 km from their settlements. They carry the water by headloads, bicycles, bullock carts and jeeps In some villages, a few people pump water for drinking and washing into tanks at their farms Individuals later transport water from these tanks

The survey indicated that carrying water from other sources occupies a large part of households' time Whereas in only 44 per cent of small villages water is brought from outside sources, in all the large villages water is brought from outside Nearly half the large villages bring between 50-150 lpd/household Out of all sampled villages 50 per cent have to depend on water from other sources Several richer households have retained a person to carry water for them throughout the year at annual wage rates of Rs 3 000 to Rs 6,000 depending upon the distance to the source and levels of scarcity in the village

Carrying water by headload is the main means of water transport in the region An estimate of headloads was done and it was multiplied by the average distances covered (kgkm) The results indicate that 44 per cent of all villages are dependent on water head loaded from other sources, 13 per cent of all villages are transporting 100-200 kgkm/household/day by headload! In larger villages the headload transport per household is higher than in smaller villages

During this survey water from 16 sources was sampled for quality Two samples were from household drinking water pots while the rest were collected directly from borewells Water quality assessment was undertaken with Colilert test kits which indicate the presence or absence of coliform and E coli bacteria

Water quality in the region is dependent on many factors In severe water shortage conditions, pollution by direct contamination occurs when people get down into wells with very little water to collect whatever water that seeps into the well gradually The water in such wells is exposed to coliform contamination from the hands and feet of the people getting down into the wells

In most borewells the possibility of contamination stemmed from poorly built platforms and drainage systems, and direct leakages of surface water into the borewell wherever submersible pumps have been fitted Contamination was caused when the outlet pipe leaked surrounding waste water In Utka A settlement, for instance, there was a pool of dirty water submerging the

whole borewell An attempt was made to correlate the number of user households per hand pump in a given village and the water quality (Table 2)

In villages with only submersible pump based water supply systems contamination is nearly total Wherever handpumps are the main source of drinking water the contamination depends on the number of users Where the number of households per handpump is low nearly two thirds of the sources were uncontaminated and where households per handpump are in the 100 300 range 86 per cent of hand pumps were contaminated The higher the usage the higher the possibility of damage to the platform and formation of sewage pool around the handpump

In this region either the handpump platforms and pumps were built without sufficient care or the expansion of the soil has resulted in the development of cracks in the platform As the depth to bed rock is generally less than 10 m the space between the casing and surrounding soil can form a conduit for the movement of contaminated groundwater This is a serious problem that will have to be addressed immediately

Conclusion

The situation in Marathwada is typical of the distortion that a major development intervention makes without adequate examination of ground realities sustainability and the commonsense of ordinary people Water should have been a primary consideration while planning for redevelopment of the area as water crises are almost annual events Instead overbearing focus was given to seismic 'considerations' while deciding between a relocation and in-situ reconstruction strategy in the rehabilitation programme – this will almost certainly lead to increasing water scarcity The people of the area will pay a heavy long-term price for this Our key findings are that

(1) The water shortage in Marathwada is largely due to the over exploitation of groundwater for irrigation (2) There is no consistent data that links the impact of the earthquake to the lowering of the groundwater table (3) Construction activity is seriously constrained by but not a primary cause of, the water shortage in the area (4) A considerable part of the drinking water supply systems installed by the government before the earthquake has ceased to be functional due to the lowering of the groundwater table especially around settlements (5) Most handpumps have either gone dry or work intermittently every day due to lowered water table Many borewells with dysfunctional handpumps can be made operational by using deep draw (> 50 m) handpumps (6) Unless groundwater extraction is controlled, especially around settlements, no sustainable solutions are possible The government's water policy is yet to appreciate this fact and take appropriate action (7) Tanker supply cannot ensure water availability to the vulnerable and needy in the given conditions It can at best be a stop gap measure (8) Even borewell water quality is poor due to faulty design and installation of handpumps This is a high risk area for epidemics arising out of water borne diseases It is difficult to disinfect hand pump water through chlorination (9) It is advisable to prevent groundwater pollution by properly repairing borewell platforms and improving drainage around handpumps and other borewells Alternative water treatment systems like UV sterilisation may be tested for efficacy (10) Any future water supply systems have to source their water from places farther off from the settlements (at least 500 m) to prevent pollution as well as to reduce chances of drying up of existing sources Strict enforcement of ground water rules (of keeping safe distances) has to be done before any further drilling of government borewells is taken up

Under the current conditions of inequity in land holdings differences in investment capacities and endowment of water resources, limited technology options are available Future measures must primarily seek to reduce the pressure on remaining water resources Sugarcane cultivation has to be controlled and restricted to areas with sufficient surface water resources This will have to be complemented with disincentives to sugarcane cultivation in areas where ground water has to be used for irrigation Less water intensive fodder crops like maize can be grown to substitute for the loss in fodder from sugarcane Low water consuming and high return cash crops like oilseeds and grapes need to be promoted in areas where ground water is available They should not be encouraged in a blanket manner

Drinking water has to be given priority over irrigation This would involve strict control of over-exploitation of ground water in areas of deficit An area of at least 300 m radius around drinking water borewells needs to be freed of irrigation borewells Surface and ground water resources have to be developed simultaneously and should percolation tanks around drinking water borewells This would also involve shifting drinking water borewells into marginal land on the higher terrain of the villages and taking over at least 2 ha of surrounding land for afforestation and percolation tanks Large settlements need to be decongested and small hamlets of less than 600 population size should be promoted Special arrangement for cattle during droughts (for both water and fodder) in cattle camps will have to be made

CALL FOR PAPERS

Commencing in 1991, India has tried to implement some far-reaching economic reforms As a consequence it has become one of the most closely watched economies in the world The **Journal of International Trade and Economic Development** is devoting a special issue in 1996 on the subject of **'Economic Reforms in India in the Nineties'**. It expects to produce a volume that will be of interest to policy makers and researchers in India and outside If you have a paper on the subject or are currently working on a topic which broadly fits the above general title, you are welcome to submit the paper to JITED Only submissions received before December 1995 will be considered for the special number

Papers should be submitted to guest editors

KERALA

Destruction of Unique Ecosystem of Kochi Backwaters

K M Seethi

The Goshree Island Development Project which threatens the unique ecosystem of the Kochi Backwaters, is being opposed by environmentalists.

THE Goshree Island Development Project (GID), which has apparently got the green signal from the union ministry of environment and forests (MEF), has been in the news for the last few months. Details of the entire scheme of mega development project have long been shrouded in secrecy. It was only when some environmentalists and a section of the press rang the tocsin that the details began to pour in.

There are those who say that people who oppose the development plan are really putting a spoke in island's wheel, thereby denying them a long-cherished bridge linking Vypeen and other islands with the mainland. This is perhaps the most ticklish question which the environmentalists have to address themselves. Admittedly, the demand for a bridge linking Vypeen to Kochi has been pending for several decades now, and for the three-lakh odd population of the islands (of which nearly a quarter commutes daily to the mainland) it is important. Nearly four decades ago, when Kochi was under the erstwhile princely rulers a scheme was worked out by the then public works minister, Sahodaran Ayyappan, to construct a bridge, and a British company was almost contracted for the purpose but the ministry fell soon. The Greater Cochin Development Authority submitted a proposal to the union government for the comprehensive development of the islands. But the plan again fizzled out, this time for want of necessary funds. Meanwhile the island dwellers were put in severe hardships for several years by not providing necessary water transport facilities.

It is in this context that the Goshree project came into prominence by placing the long-standing demand for a bridge high on the agenda of the development plan. Hence, it is only natural that any resistance to the project is likely to be interpreted as an attempt to keep the islanders in perpetual agony.

In May 1994 the state government, through an extraordinary gazette notification, set up the Goshree Island Development Authority (GIDA) with the chief minister as chairman and the district collector of Ernakulam as secretary. The local MLAs, MPs, presidents of different panchayats and other heads of departments constitute other members of the development authority. The project envisages the comprehensive development of Vypeen and other islands which should be carried out in three stages. In the first stage nearly 110 hectares of backwaters lying near to the Thanthonni island and 44 hectares on the western part of the Mulavukad island will have to be reclaimed. Then, four bridges will be constructed linking the mainland to Thanthonni, Mulavukad, Vallarpadam and Vypeen islands, totalling more than 1.4 km, with 13 km of approach roads. According to GIDA officials a ring road will also be erected on the model of the German autobahn to interconnect all the bridges and there will be marine drives here. It is also proposed to implement a masterplan for tourism development in seven panchayats of the islands with facilities for parks, golf course, etc. There is also a plan to develop Cherai beach as a top class tourist resort.

In the second stage two more bridges will be constructed – one connecting the Thanthonnithuruthu with the National Highway (NH) 17, on the northern part, and another connecting it to the NH 47. This requires reclamation of another 90 hectares of backwaters from Thanthonni. In the third stage it is proposed to develop nearly 128 hectares around Vallarpadam. GIDA officials say that nearly half of the land to be developed would be retained as open space making facilities for parks, golf courses, etc. The project estimate is to the tune of Rs 8,000 million and nearly 40 per cent of this amount will be earmarked for the first stage alone. GIDA has apparently made arrangements with the City and Industrial Development Corporation (CIDCO) of Maharashtra, which was instrumental in developing New Bombay, for the reclamation of the backwaters.

The former district collector of Ernakulam who happened to be the secretary of GIDA took great pride in this mega development project because the entire scheme is 'self-sustaining', in the sense that the funds required to support the project would be generated from within and there is no need of relying on any external agency for aid. To put it in plain language the scheme involves that more land be reclaimed than is actually needed to support the bridges and this reclaimed land would be handed over to whom the construction contract has been given. The land for this 'barter system' would be made ready by dredging the backwaters at a cost of Rs 1 million per acre and disposing of the 'excess' land for commercial purposes. It may be noted that the land value in Kochi is skyrocketing these days and the market rate for the reclaimed land is estimated to be Rs 1 to 1.5 million per cent. The project officials say that they can collect at least Rs 50 million per acre after dredging.

However, environmentalists say that the project is being used as a pretext by a real estate mafia to grab public land worth several thousand crores. According to M K Prasad, a noted environmentalist, a Bombay-based firm enjoying high level political patronage is hand-in-glove with the real estate mafia active in Kochi to corner the lion's share of the 905 acres.

Unique Ecosystem

The project undoubtedly raises fundamental questions which have a significant bearing on the unique ecosystem of the Kochi backwaters. It would certainly cause immense harm to the environment because it is proposed to be implemented in a very sensitive zone – the meeting place of the Arabian Sea and the backwaters. Even if a small portion of the backwaters is converted into land, it would set in serious imbalances to the ecosystem, thereby adversely affecting the biodiversity of the backwater system and destroying an abode of rich marine life forms. This is due to variations in salinity content which is always subject to the tidal amplitude. Of the 180 varieties of fish identified so far in the area, 80 could survive only in the existing environment and their life-cycle depends solely on this ecosystem.

A study by the Central Marine Fisheries Research Institute (CMFRI) says that the proposed site for the project "is a highly productive tropical estuary", which also acts as a buffer zone, and quite indispensable for many species of marine finfishes, crustaceans and molluscs. Many euryhaline species are permanent residents and several migrant species from both fresh water and marine ecosystems are often attracted to this area. At least 15 species of finfishes are commonly

present in this estuary as are about eight species of commercially important crustaceans represented by penaeid prawns, caridean and crabs The low lying swamps and tidal creeks dominated by patches of mangroves, with their high capacity for nutrient recycling, provide shelter to the young of many species of prawns and fishes The backwater system is also a potential area for seed resources of five species of prawns, according to the CMFRI study Notwithstanding these findings, the CMFRI came to the slap-dash conclusion that the reclamation of estuarine areas would not significantly affect the ecosystem and the associated biota, as "it forms a shallow area" It says "no vulnerable or endangered species inhabit at present in the area and there are no large-scale fisheries existing"

Meanwhile the 'environmental committee' of the GIDA consisting of some scientists of the Cochin University of Science and Technology (CUSAT) and the Central Institute of Fisheries Technology (CIFT) ruled out the possibility of any serious imbalance to the backwater ecosystem due to land reclamation and other project activities They said that the filling up of the shallow and marshy areas would not pose a threat to any major species The committee even said that "there are no endangered species in these areas", and claimed that the dredging to be carried out for the project "would result in the deepening of the area and increase in hydrological flow, leading to the better growth of flora and fauna

But these eminent scientists conveniently ignored the fact that in a healthy estuary, shallow areas have a particular ecological function as the younger shrimps and fishes take shelter in the shallow estuarine areas as breeding grounds, especially during high tides at night They migrate to deeper areas as and when they grow bigger according to scientists at the School of Industrial Fisheries, CUSAT Needless to say with the proposed dredging in the backwaters, the entire marine species would go to rack and ruin Likewise there would be substantial increase in sea erosion which could upset the entire environment in the long run Many scientists also fear that with the implementation of the project the high concentration of metals, as already pointed out by several studies, would go up because of the changes caused by flushing rates

GIDA's application for environmental clearance from the MEF was accompanied by two important 'reports' The Consultancy Engineering Services (CES) was engaged by the authorities to examine whether the project would cause any environmental problems The CES's 'Initial Environmental Examination' report, along with the 'Baseline Report' of the Kochi-based CIFT provided 'vital' data concerning the ecosystem of Kochi backwaters. These two reports have recommended the mega project saying that it would cause no harm to the environment The studies by the CES and CIFT are distinctly biased and scientifically questionable They took just a cursory view of the ecosystem by relying on short-term investigations and without seeing the backwaters as a long-term productive system being subjected to conditions like tidal flow, sea level changes, salt water irruptions, etc. Sensing the danger, environmental groups made representations to the MEF for a thorough inquiry into the whole question

By January this year, the MEF sent its environment assessment committee to Kochi to study the impact of the project on environment In connection with this a meeting was arranged at the CIFT conference hall on January 28 Here, the Kerala Sastra Sahitya Parishad (KSSP), the Dheevara Sabha (DS), and the National Fishermen's Forum (NFF) were given a chance to put forward their views These three organisations presented their arguments against the project in no uncertain terms However, the proceedings of the conference went in such a way as to give a clean chit to the scheme Prasad, who attended the conference and spoke on behalf of the KSSP says that it was a "stage-managed affair and the whole idea was to clear procedural formalities" In a note to *The Hindu* (February 1), he pointed out that some of the scientists with whom the committee had discussions privately informed him that the whole thing was an eyewash Prasad was told that GIDA had some 'captive' scientists who would keep their views secret and save its face He also wondered how GIDA managed to bypass the Coastal Zone Protection Act which prohibits reclamation and construction activities in the backwaters

Even as reports of the Goshree project continued to surface, many environmentalists took up the question in right earnest, and two petitions were filed in the Kerala High Court against the project But the high court dismissed the petition saying that the petitioner (filed on behalf of the Institute of Social Welfare) failed to produce sufficient evidence to establish that the GIDA has actually initiated any work, as alleged However, the judge observed "If the petitioner believes that the proposed plans are ill-advised, it is for him to create public opinion and campaign against the same"

Already several environmental groups and organisations, notably the KSSP, NFF, DS and the Swashraya Vypeen Samiti have come down heavily against the project and demanded a fair and comprehensive study dealing with all aspects of the ecosystem All of them pooh-poohed the so-called environment impact assessment study conducted by the CES and CIFT saying that their reports and data are quite unintelligible, for they relied only on short-term sampling in June-July 1994. The KSSP and the NFF said that this was akin to "recording of the temperature of the earth surface at mid-night or on a rainy day", adding that the assessment would be complete only if it is extended round the year.

The enviornmental groups demanded the setting up of a new team of investigation consisting of experts in the respective fields, as well as people's representatives The scope of the study should be extended beyond the usual sampling, encompassing factors like estuarine dynamics, tidal amplitude, salinity structure, life-cycle of prawns and other species, marine resources, sedimentation, pollution, etc, of the backwaters The KSSP claimed that the information regarding these phenomena has been on hand since 1960s and they have to be brought to light and subjected to thorough public scrutiny and debate The KSSP is also opposed to mobilising funds for the project by selling off the reclaimed land in the backwaters It demanded that alternative sources of funds be explored, besides augmenting the existing water transport facilities

Needless to point out, the project will render thousands of fishworkers who eke out their livelihood by depending on the marine resources of the region jobless The secretary of GIDA, on the other hand, claimed that the project would provide direct employment to 1 5 lakh people when the first stage is completed For that they have plans to propel tourism as one of the major industries in the islands In other words, the three-lakh island dwellers have to mortgage their culture for the sake of a debilitating development plan The islanders who have been longing to have a bridge must realise that it is being used as a bargaining card for higher stakes

The apprehensions of the people about the project are, no doubt, well-founded given the experience in Kuttanad which has undergone tremendous transformations during the last few decades, causing widespread destruction to the environment For them the backwaters of Kochi are not just a matter of grandeur alone, but an inevitable link in the unique ecosystem which sustains profuse life forms Any damage to this system would have disastrous consequences, affecting not only the precious marine species, but the very life-blood of lakhs of people living in Kochi and nearby places.

Bringing Justice to Juveniles

Extension of Poverty Alleviation Programmes

Shiva Jaamdar

The current emphasis on custodial care and social control in dealing with juvenile offenders has serious limitations. The extension of the provisions of the poverty alleviation programmes to these juveniles will facilitate their rehabilitation.

THE plight of children from poor families in India, particularly in towns and cities, is increasingly getting worse over the years. The joint family system and bonds of community which provided safety nets to children are gradually breaking down. Burgeoning population growth, increasing rural out-migration and growth of ugly slums in urban areas are further aggrevating dehumanisation of children. As child-beggars and rag-pickers, runaways and vagrants, orphans and destitutes, forced child labourers and delinquents, child prostitutes and pimps, these helpless children reflect deeper social and economic maladies: the problems of unemployment and poverty, family disorganisation and inadequate measures of social security [Boszormenyi-Nagy and Spark 1984].

Recognising the need to provide for the welfare of children found in unfortunate circumstances, the parliament enacted the Juvenile Justice Act in 1986 (*Juvenile Justice Act*, Government of India 1987). The JJ Act applies uniformly to all the states and union territories after repealing the divergent state acts on the subject. It lays down a common definition of a child as a boy under 16 years and a girl under 18 years of age. It has created in particular a system of institutions, procedures and programmes uniform throughout the country to deal with children found in difficult circumstances.

While the JJ Act provides definite short term relief to the needy children, it invariably suffers from the vice of excessive emphasis on institutionalised care and custody. Out of the 63 sections, 53 sections in the act exclusively pertain to institutional matters while only one section (section 12) passingly refers to after-care and rehabilitation. A detailed criticism of the act is out of place here. It must be said however that in the past juvenile justice legislation in India was a replica of the British juvenile laws and their philosophy. The erstwhile British colonial administration adopted its home laws to India. British juvenile justice was indeed a confusion between social control and social welfare [Adams 1978; Shaw 1977; May 1973]. The same confusion is reflected in its imitation in India as well. The British thinking and practice has however changed enormously since the 1850s when the old philosophy took shape: the Borstal schools meant for young adults have been abolished; the children act has been amended several times; a separate Children and Young Persons Act has been in operation since the 1930s; and institutional care has been largely replaced by family support programmes and community care [Hendrick 1994]. It is surprising therefore that the latest Indian JJ Act of 1986 still reflects the old ideas of institutional care as a means of social control rather than the lasting rehabilitation of helpless children as a measure of child welfare.

This article argues that the current emphasis on custodial care and social control of juveniles in India should be shifted to earnest rehabilitation and genuine child welfare. It suggests that a good way to rehabilitate the unfortunate children is to extend to them various poverty alleviation programmes (PAPs). The article also explores the possibility of a tentative model to link the PAPs to juvenile institutions.

Institutional Care

The JJ Act was brought into effect throughout the country in 1987. The programmes and institutions thereunder provide an opportunity to judge its efficacy. A brief review is presented here to highlight the relevant points.

Deriving its philosophy from the western traditions, the JJ Act is intended *inter alia* for a special treatment of child destitutes and delinquents separated from adult destitutes and criminals. It also separates the delinquent children from the non-delinquent ones. The delinquent children, i e, those who commit crimes, are apprehended by the police, heard by the juvenile court, and if appropriate, are committed to a special home established for the purpose. On the other hand, destitute children, orphans, neglected and victimised children and those seeking help voluntarily are referred to the child welfare board by social workers, probation officers, police, members of the public or even helpless parents. The board may commit them to a children's home created for their care. These two distinct streams of procedures and institutions run in parallel. Their programmes and objectives are however identical. This odd combination mixes up social control with social welfare neither achieving lasting welfare nor effective control of the juveniles.

Most of the children's homes and special homes are run by the government. A few run by others are recognised and aided by the government as prescribed in the law. On an average, a destitute child spends about six to eight years in children's home and a committed delinquent about two to three years in a special home. During this period, the government spends on the whole an all-inclusive average of Rs 300 per month per inmate. This is a considerable amount when compared to less than Rs 100 per month paid as oldage pension, widow pension or as allowance to a handicapped person in many states, in the country. Each inmate gets standardised food, clothing and accommodation as prescribed by the rules. Suitable inmates are given education up to a maximum of standard X. They are simultaneously trained according to their educational level and aptitude in some trade or vocation such as weaving, tailoring, radio repairing, carpentry, smithy, typing, knitting, embroidery, doll making, etc. Education and vocational training are intended to help them in their post release rehabilitation [*Juvenile Justice Rules*, Government of Karnataka 1987]. Once a boy reaches the age of 16 or a girl the age of 18, he or she is discharged from the institution.

Problems in Rehabilitation

In the JJ Act there is no provision for comprehensive rehabilitation programmes for the released inmates. Section 12 mentions about after-care organisations. In reality nothing worthwhile exists in the field. A few progressive states like Maharashtra, Karnataka and Gujarat have district after-care hostels where some needy ex-inmates live on a contributary basis. After-care has simply come to mean a transfer to inmates to another set of institutions.

This narrow conception only serves as a function of social control, regulating for a short period unruly juveniles who are a menace to the society. A realistic approach, on the other hand, calls for more comprehensive measures directed towards the inmate's entire life situation, dealing with problems of his or her shelter and support, employment, and establishing his or her social network to integrate him or her into the family, the neighbourhood, and the community.

What happens to the young adult after discharge from the institution depends upon

a host of factors If the inmate's social network is intact and normal he or she will not face any problem in successful reintegration into the social milieu from which the inmate comes Such cases are only few

Most inmates come from highly disorganised families A poor mother, alone or with other dependent children, deserted or widowed cannot be of much help to the released inmate An old or sick widowed or deserted father with no means cannot also offer much help The parents though alive but too old sick or resourceless will not serve the pu pose of rehabilitation Much worse are the cases of parents who are professional beggars or mendicants incurable alcoholics or drug addicts lepers or lunatics habitual offenders like prostitutes gamblers, bootleggers or petty thieves Inmates coming from families of unreformed ex-criminal tribes gypsies, other nomadic groups practising all sorts of professional beggary in the guise of sooth sayers, songsters, dancers, acrobatics etc, face very uncertain future In all these cases instead of seeking supoort of parents the young adult on discharge is rather expected to support his or her parents and family Otherwise he or she will be an additional mouth to feed in the already beleagured family

Most critical is the situation of orphans and total destitutes Such children come from a variety of backgrounds some are brought to the institutions as neonates deserted by unwed mothers or widows a few are totally orphaned in catastrophes like floods epidemics, earthquakes famines or even communal clashes a small number is brought as missing children never claimed by any one Quite a few of them are so secular that they know no religion or caste nativity or parentage They are the most genuine wards of the state playing the role of in loco parentis Once discharged from the institutions without rehabilitative measures where do they go? What do they do?

Further the inmates are handicapped by the long spell of institutional life It is not conductive to their post release adjustment to the society They are not used to taking independent responsibility as free individuals even for their own daily requirements like food accommodation or work They carry the stigma of 'problematic' boys or girls throughout their life Even a good intra mural training cannot equip the inmates with adequate social and emotional skills necessary for creating and maintaining healthy inter personal relations in work family friendship neighbourhood and community [Lipton et al 1975] For this reason advanced countries like Sweden Norway Denmark, the U S and the UK are diverting children from institutions to more and more family support and community-based programmes [Inger and Neils 1993, Colton and Hellinckx 1993]

Only educational and vocational skills recieved in the institution cannot by themselves enable inmates to get a reasonable employment, accommodation or other inputs There is no specific quota for this category in recruitment sanction of credit or allotment of houses or sites, etc They must compete with others In an over-populated country with few resources competition is tough In this scenario the supportless young adults released from juvenile institutions running from pillar to post to secure some resource of normal livelihood soon grow desperate Is it surprising then if an ex inmate turns into a helpless beggar or a desperate criminal, or a pimp or a prostitute? Our system of gathering annual criminal statistics is not equipped to adequately measure the percentage of recidivism of delinquents and ex inmates of these institutions Definitely some of them are forced by circumstances to indulge in nefarious activities including terrorism Years of training in the juvenile institutions and heavy investment in them go waste if the helpless inmates once released cannot be helped to lead lives as normal citizens There can be no other better reason than this to introduce rehabilitation programmes for the needy inmates of juvenile institutions

India is a signatory to the UN declaration on the rights of the child 1989 as well as to the declaration of the world summit for children 1990 Articles 20 22 33 34 35 39 and 40 of the declaration of the rights of the child directly relate to the state's responsibility for reintegrating the parentless children neglected and victimised children, delinquents and refugee children back into their families neighbourhoods and communities Indian Constitution in article 15 (3) specifically empowers the state for promotional discrimination among children for their welfare Rehabilitation particularly of the orphans destitutes and neglected children is a long felt need that needs early action In the current conditions of socio economic development in the country a good way of providing easier and cheaper measures of rehabilitation to the inmates of juvenile institutions seems to be perhaps to extend the existing PAPs to them since most of them come from highly impoverished background

Forging Links

The PAPs which provide resources directly to the poor individuals and families seem much better suited for the purpose of rehabilitating the inmates of juvenile institutions As they are implemented at the present, the integrated rural development programme, the special component programme for the scheduled castes, the tribal sub plan, the training of rural youth for self employment, and the prime minister's rozgar yojana, are quite adaptable for this purpose These programmes provide highly subsidised long-term credit at low interest rates to the eligible poor families for any income generating small industry, business, or service They also provide some linkage to the training input and market networks (*IRDP Manual* Government of India 1992) The inputs basically required for rehabilitation of the inmates of juvenile institutions are as follows

(a) *Common Features* Certain aspects of PAPs are conductive to their easy extension to the juvenile institutions firstly, planning, co-ordination, and control of implementation of the PAPs is done mainly at the district level although their implementation is at the taluka and village levels Incidentally most juvenile institutions are located at or closer to the district headquarters although their inmates come from villages and towns where they are to be reintegrated Secondly the district level officers the district collector and the chief executive officer of the zilla parishad who plan and control the PAPs are also indirectly responsible for the supervision of juvenile institutions This helps easy inclusion of the juveniles into the PAP network Thirdly the PAPs aim to help the beneficiaries to help themselves is precisely the objective in rehabilitating the juveniles

(b) *Eligibility*: Under the norms of the IRDP which apply to other PAPs as well, the eligibility for assistance is based on the family annual income being below the official poverty line [GOI 1992]. Clearly, most juveniles coming from the poor families qualify for assistance. But since they have not a family in the strict sense of the term, they may be leniently defined as a 'single member family'.

(c) *Age-limit to Major*: As girls are released at the age of 18, they are majors in the eyes of law. But boys being released at 16 have to wait for at least two more years to qualify in terms of age. In the JJ Act there is a provision for extension of the stay of desiring and deserving inmates. Such boys may also be transferred to the existing after-care hostels during this period. The waiting period may be used for placing them in an appropriate trade, business or service outside the institution as an apprentice. Such apprenticeship would help them improve not only their job skills but also skills of inter-personal relation management in the society at large where they have to live on their own after release. The after-care hostels will serve as half-way-houses and the cost during placement may be met out of TRYSEM funds.

(d) *Size of Clientele*: The number of inmates released annually from the juvenile institutions in the states is not too big. Distributed over the districts there would be around 200 to 300 inmates to be rehabilitated in each district. The collective target of all PAPs in each district is in several thousands. Addition of juveniles would not inconvenience the regular target groups too much. Later special quota may be thought of.

(e) *Modalities*: Juvenile institutions and their controlling department may have to be linked to the PAP implementing arrangements at the state, district, taluk and village levels. Major burden of planning rehabilitation for each inmate in advance, consolidating all individual proposals at the institution level, and later at the district level will have to be borne by the controlling department. It shall also shoulder the responsibility for periodic monitoring, supervision and co-ordination at various levels with the help of district level officers and committees. These tasks necessitate reorientation of the controlling department with adequate training, staff and information network.

The model of rehabilitation presented here has the advantage of being very economical since no heavy additional financial outlay or huge staff is necessary to implement it. It uses the available resources and existing decentralised agencies for rehabilitating inmates in the immediate social network wherever possible. Through co-ordination and linkages between the juvenile institutions and the PAP implementing machinery the major goals of effective rehabilitation of needy juveniles may be achieved, where none exists at the present.

SOCIAL STATUS OF WOMEN IN DEVELOPING COUNTRIES

Editors
Man Singh Das
Vijay Kumar Gupta

The book explores the nature of social changes with incisive theoretical analyses of their influence on women who have been relegated to a secondary position in the emerging human configurations. The book also focuses on the past traditional roles of women and identifies directions of change, rate of change and the causes of change in women's status.

Vietnam: Twenty Years After

M S Shivakumar

Twenty years after the fall of South Vietnam to socialist North Vietnamese forces, the normalisation of US-Vietnam relations still depends on the resolution of several contentious issues, the most important of which is the tracing of US prisoners of war personnel missing in action.

IN the decades following the second world war the name 'Vietnam' came to signify either a brutal jungle war zone or a spectacular failure of American power – or both. These standard images were captured in half-a-dozen motion pictures, several television drama serials, countless university courses and hundreds of books about Vietnam that captivated audiences around the globe. Most of these descriptions portrayed Vietnam as a nightmare land where American boy soldiers were assailed by faceless, ruthless guerillas, a symbol of hardline communism, where the party brooks no dissent and cuts itself off from the mainstream of the world; a country so forbidding that thousands of 'boat people' have risked their lives in flimsy craft on the open seas to escape it. That war was over sometime in April 1975.

The Vietnam war lasted some 30 years, killed three million people or more. It featured sieges, set-piece battles, guerilla clashes, the most intense aerial bombardment in history, terrorism and much more. The US lost about 56,000 servicemen and a few hundreds were found 'missing in action' Vietnam lost hundreds of thousands of people; presently, it has about 6,00,000 war invalids among northern veterans and two million civilians who suffer from the 'war trauma". Even today any visitor to North Vietnam observes lot of evidence of destruction and torment the place endured, either physically or among the people Vietnam has spent two decades caring for the war invalids and will probably spend more time in the future too.

In April 1995, Vietnam celebrated the 20th anniversary of its victory over Uncle Sam and the ceremonious integration of south and north regions into one nation. The government formally declared a name for its April 1995 celebrations titled 'The 20th Anniversary of the Complete Victory in the War of Resistance Against US Aggression for National Salvation'. Party newspaper appealed to the citizens "to observe the anniversary quietly; we show to the world that now we are a nation with pride". Behind such an appeal there were traces of concern that if they make a huge spectacle out of this anniversary, it will only serve to make the world continue to think of Vietnam only in terms of the horrible war. The party newspaper, in its run up to the 20th anniversary celebrations, summarised the general feeling among the masses thus: "When we hear the firecrackers explode on the anniversary, we will feel happy about our victory, the victory of Uncle Ho Chi Minh and the Vietnamese Communist Party But also on this day we will light incense for the dead, and we will feel so sorry for all our dead comrades".

Twenty years after the fall of South Vietnam to socialist North Vietnamese forces, xenophobia on the part of the leadership in Hanoi and a US-led campaign to isolate Vietnam internationally resulted in a sharp reduction in the quality and quantity of information available on Vietnam, especially that which transcended the narrowly political. To understand the lessons that we learned from the Vietnam war in the present day context one can look at what remain as the contentious issues in 1995 between Vietnam and US. As a background two key efforts are to be kept in mind: towards the end of the 1980s the Hanoi government began trying to reduce Vietnam's international isolation, in part by opening the country's doors to foreign visitors. Around the same time, the new spirit of co-operation that has come to characterise superpower relations started having an impact on Indochina, resulting in perceptible shift in US policy towards Vietnam in 1990.

In February 1994, Washington ended an economic embargo on Hanoi imposed in 1964 after it entered the war. They established formal links and opened diplomatic missions in 1995 and full relations look likely in the next year or two. Vietnam says it's time to bury the past and for the US to realise that "Vietnam is a nation, not a war". Vietnam could not have achieved its present international 'acceptability' without US approval when Washington took steps to lift its *de facto* ban on International Monetary Fund and World Bank assistance in July 1993. The US did not object when other governments, led by France and Japan, offered to repay Hanoi's IMF arrears, clearing the way for new loans. The IMF, World Bank and the Asian Development Bank have since approved over one billion dollars in aid for roads, ports and other projects vital to Vietnam's drive for growth. Rich nations have pledged 3.8 billion dollars in aid to Hanoi in the past two years. Business executives from the west and 'tiger' neighbours from Asia are falling over each other to explore investment, manufacturing and sales prospects in Vietnam; the US ranks eighth among Vietnam's foreign investors, with 30 investment licences, totalling 500 million dollars. In addition to big names like IBM, Pepsi and Coca Cola, scores of smaller US investors are now exploring possibilities for trade and investment in Vietnam.

Contentious Issues

From the very beginning, the normalisation of US-Vietnam relations had a strong domestic undercurrent, even when the ostensible issues were global and strategic These domestic elements of the relationship are complex, but boil down to two key issues. The first was the post-war prisoners of war/missing in action [PoW/MiA] issue, which was domestically driven, and eventually overshadowed by other aspects of the relationship. The second was the reparations of the war to Vietnam as an entitlement especially environmental destruction that was caused during that decade long battle The fact that the relationship largely comprised of the projections of American internal concerns also helps to explain as to why the path it travelled has been littered with specific conditions or performance criteria. The implications of this trend for US-Vietnam relations came to light in April 1995, and asserted a legitimate interest in both the form and the internal actions of foreign governments.

Is the MiA matter *en route* to resolution at long last? Vietnam has played its cards quite masterfully, albeit, sometimes causing involved Americans to suggest privately that an element of deception, at least in the past. Very few knowledgeable Americans believe that there are any living PoWs in Indochina, or that they have been there in the recent past. But understandably, MiA families are not easily persuaded, especially when stories surface repeatedly that raise hopes. Yet as the slow removal of American embargo intensifies, Vietnamese officials have been increasingly forthcoming, and the issue is receding.

According to latest figures, 1,619 US servicemen are still listed as missing in action from the conflict in Vietnam. A further 501 are listed in Laos, 77 in Cambodia, and eight in China. Since its establishment in September 1988, the US MiA/PoW Task Force and its local counterpart, the Vietnamese Office for Seeking Missing Persons, have conducted 35 rounds of searches, comprising hundreds of individual field visits, at an estimated cost of US $ 100 million annually. This effort is split into four parts: 'discrepancy cases' or instances where a missing US serviceman was last reported

alive, but has since disappeared; trilateral searches involving teams from the US, Vietnam and Laos in areas under North Vietnamese control during the war, the returning of remains, and access to Vietnamese documentation which the US authorities believe could help solve the fate of those still missing An US spokesperson recently agreed that extensive efforts made by the Vietnamese authorities in reducing the number of discrepancy cases down from 200 to around 50 and in trilateral searches Washington continues to be dissatisfied with progress in the return of the remains and access to documentation

Robert Destatee chief of Archival Research Activities for the Task Force in Hanoi in a recent interview to the press [during the anniversary celebrations] disagreed with such views 'Some believe that the Vietnamese have not done enough in this field others such as myself believe they have made a good faith effort and have shared what they have with us There is an unrealistic expectation on the part of some US analysts as to the quality and quantity of documents that the Vietnamese have While they are basically accurate many of the documents share the same problem as ours in that they tended to over inflate their estimates of the casualties they inflicted on the enemy

Such statements were not well received by the ex servicemen and their supporters in the US who allege that thousands of Americans are still languishing in prison camps across Indochina In fact on June 3 1995 Reuters news agency reported from Hanoi as follows Bill Hendon a US activist on the issue of servicemen missing from the Vietnam war turned up in Hanoi this weekend sparring with the US officials and saying he had information showing there were still live US prisoners of war in Vietnam However Col Melvin Richmond, head of the Hanoi detachment of the Joint Task Force Full Accounting denied this but offered to thoroughly investigate the descriptions if Hendon provides complete information of his claims However, Hendon refused to handover information that he claimed to hold Later Col Richmond expressed his despair of the situation Comment was not immediately available from Vietnamese authorities, who in the past have accused American MIA activists of trying to obstruct improving US-Vietnamese relations "Thus, the servicemen lobby and activists have mounted a highly visible campaign which reportedly includes boycotts, threatening letters and telephone calls to US corporations considering doing business in Vietnam, and more recently, publicising their cause on the Internet Though persons like Destatte and others dismiss such claims and argue that most of the documents seized from the North Vietnamese were screened for any evidence of live PoWs/MIAs, they also claimed to have interviewed over a quarter of a million prisoners and had battalions of people monitoring their communications In the last few years, MIA Search teams have also visited every district in the country, some more than once, and investigated thousands of live sighting reports, none of which have proven to be accurate If there were any prisoners other than those who have returned to the US, it is inconceivable that the search team would not have known However, MIA issue remains as a determining factor in US-Vietnamese relations

On its part Vietnamese wait for US accounting of defoliant war More than one million hectares of tropical rainforest and 50 000 hectares of ecologically vital mangrove forest were destroyed by the US s saturation spraying of defoliants especially Agent Orange' designed to strip bare the jungle habitat of Viet Cong guerrillas The unprecedented ecological devastation remains one of the most bitter legacies of the Vietnam war Since 1975 an international body of scientists have also been studying the mounting evidence that human exposure to herbicides has led to a series of health problems including damage to the nervous system, increased risk of cancer and birth deformities

Vietnamese forestry expert Thai Van Trung who has been studying the herbicidal catastrophe since 1975 concluded in a research study that 72 3 thousand million litres of herbicides mainly Agent Orange were sprayed on 10 per cent of South Vietnam between 1960 1971 destroying over one million hectares of tropical semi evergreen forests that amounts to 15 million cubic metres of timber with a commercial value of one billion dollars and regeneration is impossible as it would need 100 years for the soil to fully recover We have noticed climatic changes an abnormal increase in the number of typhoons and floods which has seriously hampered our development ' [*The Nation* May 1 1995] Arnold Schecter of Syracuse University studied the harmful effects of toxins from herbicides on human beings and concluded that there is a clear correlation between exposure to Agent Orange and abnormally high incidence of some types of cancer Endocrine abnormalities were also found in US veterans involved in spraying the chemicals Higher dosage levels have resulted in damage to the nervous system During the 1970s blood tests in Vietnam on people in the south who were known to be exposed to the chemical spraying showed levels of dioxin 900 times higher than Vietnamese who lives in the north Schecter's most recent research on the results of 1995 testing of dioxin levels in the blood (*American Journal of Public Health*, April 1995) notes that southerners still have dioxin levels up to 50 times higher than their compatriots in the north, he also wrote that although most Agent Orange studies have focused on American veterans many Vietnamese had much greater exposure The Vietnamese lived in rural areas, wore open sandals, and while working in the fields were likely to eat contaminated food and drink contaminated water By contrast US veterans generally served in Vietnam for only a year, and consumed US-supplied food

This medical evidence has enabled many US veterans to win lawsuits against the herbicide manufacturers In the later 1970s thousands of US veterans launched a class action claiming they were harmed by contact with dioxin The lawsuit claimed a grand total of US $ 40 billion in damages While the defence contractors blamed the Pentagon and argued that they were not made aware of the military application of herbicides and their long-term consequences and only the Pentagon had conducted this kind of research, the US government denied responsibility Eventually the two herbicide manufacturers settled the lawsuit for US $ 180 million but have subsequently gone out of business trying to settle further individual claims On April 3 the Supreme Court of US agreed to hear their appeal that the responsibility rests with the US government and that the US defence department should reimburse all the damages and costs shelled out to the many plaintiffs

No doubt Hanoi will watch with great interest the Supreme Court ruling expected sometime after October 1995 However the fact that herbicide companies have been forced to accept the medical and scientific evidence has interesting implications for a vastly greater number of potential Vietnamese plaintiffs which could one day become a test case in international law

The after effects of Vietnam War are not only felt among the two major contenders but also among other war allies of US like South Korea, Australia Thailand and the Philippines For example, after Seoul agreed to send troops in July 1964, more than 3 00,000 soldiers fought alongside their American and South Vietnamese allies against North Vietnamese troops Nearly 5 000 died and 20,000 were wounded and three were reported missing in action But 20 years later, Agent Orange has left a deep scar on a nation that paid a debt of gratitude to US in the jungles of southeast Asia South Korea is now grappling with those veterans affected by toxic chemicals the US poured like killer rain across the Vietnamese jungles In March 1995, a new association was formed in Seoul to represent the cause of South Korean victims of Agent Orange This association recently argued that We fought a tough war but the money earned by us

paid by the US government, has made a major impact on reviving the moribund South Korean economy, recovering from its own bitter war against communism a decade earlier " Such macro-economic benefits are lost on the war veterans, who are determined to seek compensation from the South Korean and US governments and the US producers of Agent Orange

However since 1975 Washington has either ignored or refused all Vietnamese claims whether war reparations, compensation or any kind of aid Even NGO humanitarian aid used to be blocked by the US government until last year when the US trade embargo was finally lifted The MIA issue has been used to drown out all other issues between the two nations with the US government insisting on a 'full accounting of all US servicemen classified as 'missing in action' as a prior condition before humanitarian aid can be considered While US policy makers claim this as an humanitarian issue, in reality this full accounting is a 'political weapon'

While the US government s MIA campaign for 'full accounting of American dead in the Vietnam War has largely diverted attention away from the colossal suffering inflicted on the civilian population – the issue of compensation or at the very least humanitarian aid for those affected by the Agent Orange' and other victims of chemical warfare is far from resolved In April 1995 at the 20th anniversary celebrations of the American War, General Tran Van Tra the top commander of the Viet Cong forces in the south reminded the world Vietnam has not dropped its claims for compensation it is logical that those who committed these actions against us should compensate us It is up to the American conscience to make amends

But since the end of the Cold War Vietnamese war claims have been put on the back burner in order to promote better relations the lifting of the US trade embargo and it is hoped that the establishment of full diplomatic relations in the near future While Washington still insists on full accounting of all US servicemen missing in action in Vietnam as a precondition for full normalisation Vietnam despite its very substantial claims puts no prior conditions on the establishment of diplomatic relations It is obvious that many Vietnamese war veterans feel somewhat exasperated by the one sidedness of the relationship General Tran Van Tra who led the Tet offensive of 1968 and is today the vice president of Vietnamese War Veterans Association argued in a recent interview that It is logical that if the US would like to get a full accounting then they should take into account the hundreds of thousands of Vietnamese MIAs it would be better if they would help us to get a full accounting of our own MIAs

The final battle of the Vietnam War will now be fought in Washington, and more crucially, in the larger political arena. Resolving the last issues of the Vietnam War agenda will depend on political decisions made based on 'economic security' concerns of America more than diplomatic negotiations with Vietnam, i e, domestic economic agenda and a more assertive trade policy The concluding chapter of the Vietnam War will be marked by specific decisions that will move the relationship dominated by the legacy of war-time concerns to a true post-war era This will be marked by the termination of the embargo, establishment of full diplomatic relations, and resolution of outstanding claims left over by the war

On the Vietnamese side, the policy context of US-Vietnam relations is somewhat different For Vietnam the situational logic of pursuing normalisation [illegible]

But like the US, Vietnam's policy makers do not have a free hand. There are clear tensions between the 'open door' measures required of an economy moving to take advantage of the dynamic regional growth that surrounds it, and the desire of some sectors of the government to sharply restrict the non-economic influences that may enter through the open door Countries like Vietnam whose policies have largely been shaped by external security threats and challenges will also find that the relationship of domestic to foreign policy is rapidly shifting In that context, the boundary between domestic and foreign policy is being eroded by intensified global interdependence One implication of this development is that the world is being brought closer to home, and that foreign policy will not be as 'foreign' as it once was In reverse, foreign policy issues are increasingly driven by domestic [illegible]

Free Press and *Realpolitik*

Robi Chakravorti

The practice of realpolitik *in modern times involves not only the covert and overt use of forces as an integral part of coercive diplomacy, but also, its shrewd application shaping the timing and the nature of news flow in the media*

A NUMBER of startling revelations of past atrocities by some of America's allies and client states appearing recently in the US media illustrate the limitations of the nature of free press and freedom of expression The press is free to publish reports and commentaries but the question arises whether some of the accounts labelled as 'investigative reporting' on the dirty politics lead to a critique and awareness of the overall picture and thereby act as corrective to wrongs or turn into episodes of cursory acts of deviance or of worthless memorabilia

Reports appearing in the press in late March and April dealt with the murder of an American woman's Guatemalan husband who was a leftist rebel The reports charged the murder to a Guatemalan colonel who was in the payroll of the CIA It took her over three years to get the government to investigate the incident Her actions involved a 12-day long hunger strike in front of the American embassy in Guatemala The alleged assassin of her husband was also involved in the killing five years ago of an American citizen who happened to have stumbled into a smuggling operation involving the Guatemalan army Investigative reports of this type of atrocity reflect one side of the operation of the free media in the US The free press occasionally exposes misdeeds like this one – reports of the murder of four churchwomen in San Salvador were published in the media 14 years ago However, reports of this type of incident are the tip of several icebergs of dirty politics conducted by the US in the name of 'national interest' and it is questionable whether the hidden structure of the long-standing practice of dirty politics is revealed so that it can be corrected

Guatemala, for instance, has for long been a target of Washington's blatant policy of intervention One such revealing incident is the overthrow of the legally elected head of the Guatemalan state, Jacobo Arbenz in 1954 by a Guatemalan colonel named Armas who was financed and armed by the US Arbenz's crime' in the eyes of the US government, was his plans for drastic social reforms which included distribution of Guatemala's plantation land owned by the United Fruit Company to peasants Colonel Armas, after coming to power returned the Arbenz-expropriated lands and permitted plantation owners to cut down wages by about 30 per cent

If atrocities are committed by America's allies and client states which do not involve Americans directly, the incidents are either played down or do not excite adequate political reaction The culprits and their

actions are either presented as isolated cases of deviance or as wrong acts which are forgiven and for which culprits are not punished

The first type of misdeeds seen as isolated acts committed by groups with which Washington has been covertly and overtly associated is exemplified by the killings in Guatemala mentioned earlier Another recent example is the report in the press of the assassination of an opponent of president Aristide of Haiti shortly after the assassination of a legislator who was a supporter of Aristide These two reports appeared in the press but the historical context of the American support of the long-standing military and thug style dictatorship in Haiti is not generally focused on these reports Aristide is a radical politician who came to power after winning 67 per cent of votes but was overthrown in a military coup soon after Since the coup four years ago, according to an account by Chris Tilly who went to Haiti with an observers delegation two years ago about 10 000 people were killed by the military junta many leading members of which were trained by the CIA Targets of the killing were of course the critics of the dictatorship One such target was an important businessman of Palestinian ancestry Antoine Izmery who was very critical of the US In a report published four years ago he colourfully described Haiti as a whore a safe house for bandits with a Mafia organisation controlling it and the boss of the Mafia is the United States He was assassinated in 1993 by army attaches after he was dragged out of a church service attended by UN and OAS observers commemorating the victims of earlier massacre The official Catholic Church which supported the pre Aristide dictatorial regime of Duvalier kept silent about the murder The plotters of the coup which overthrew Aristide organised all these killings and yet none has yet been punished Its leader General Raul Cedras was even honoured by former US president Carter Criticisms of this action by Carter have appeared in the US media, but it is unlikely that Cedras will ever face a trial for his misdeeds

These are two instances of recent acts of misdeeds performed by the US client states in Latin America Such reports do appear in the free press of the US triggering occasional criticisms which do not however lead to any basic policy or attitude change While the so-called facts presented in the free press from time to time about such atrocities are certainly welcome, if these are not seen in the context of political history they can be described as 'factoids' not facts, to use a word writer Normal Mailer used sometime ago

Recent revelations of the past acts of atrocity committed by America's two democratic allies constitute another species of investigative reporting which deserves notice for a critical evaluation of the dynamics of the hide-seek and forgive-forget approach which control the selective attention or inattention as the free press operates If someone not considered to be America's ally or client state had committed the type of atrocity cited below as examples such acts would be more strongly condemned in the media, and by officials in sharply derogatory terms and would have ended in strong official action To strengthen the justification for the Gulf war, George Bush for example, labelled Saddam Hussain of Iraq as a Hitler

Two cases of forgive-and-forget approach are submitted as illustrative examples The first is the recent acknowledgement by the president of Taiwan that when the Chinese led by Chiang Kai shek began to settle in the island in 1947 they massacred over 30,000 native Taiwanese The report appeared as a short two paragraph news item in *San Francisco Chronicle* with the headline 'Taiwan Leader's Apology for Massacre The Taiwan president acknowledged his personal involvement in the event Here is an apostle of Chinese 'democracy which was presented as an angel against the communist devil in mainland China until recently This act of atrocity is unlikely to be dramatised in the American media even if it is, it will receive only academic attention unless it serves the national interest' or interests of powerful ethnic or political lobby groups linked with the 'national interest

A case study in support of this viewpoint is the report of a dirty act by a prominent ally of the US with strong lobby influence on American politics and media It was described in a recently published book *A Death in Jerusalem* by Kati Merton The book describes in detail an act of atrocity committed by a prominent US ally Israel This act committed 47 years ago is generally ignored in the US press In 1948 Count Folke Bernadotte a Swedish UN mediator was assassinated by a Jewish gang in Jerusalem Prominent Israeli politicians such as one-time prime minister Yitzak Shamir were associated with the gang According to the book Shamir selected Bernadotte's assassination squad led by a trigger man named Yehoshua Cohen The then prime minister of Israel Ben Gurion must have known about the murder plot According to the book, he went through the motion of outlawing the Jewish Stern gang accused of killing Bernadotte and ordered scores of its members to be arrested But, within five months, he declared an amnesty and released them all, including Cohen What is startling is that Ben Gurion after his retirement from politics, moved into a kibbutz where one of his closest friends was Cohen, the murderer of Bernadotte

One way of looking at the report of this atrocity and its discriminatory neglect in the US media is to treat it as an illustration of the saying that one country's terrorist is another country's freedom fighter Another way to view this in the context of the current rhetoric of democracy and differential treatment of violence in terms of Uncle Sam's 'national interest' is to take a *realpolitik* approach to dirty politics in the context of ideological chaos resulting from the changes in the political scene the world over In this respect a statement by W G Runciman in his *Social Science and Political Theory* deserves mention In the book published over 30 years ago, he graphically described the contrast between the acts of violence by the left and the right When the left resorted to coercion, he wrote, it is to hasten the advent of promised paradise When the right resorts to coercion, it is part of the natural order of things "a way of maintaining order among poor and unruly creatures, and training them to act in a manner alien to their mediocre nature' The last part of the sentence is quoted from *The Origins of Totalitarian Democracy* by J L Talmon

Talmon's book was published in 1952 long before Jeane Kirkpatrick used the terms totalitarianism and authoritarianism distinguishing the radical types of political control which were condemned from the non radical types which were supported as necessary steps towards democracy and rule of law two phrases which have acquired almost scriptural value in contemporary American political rhetoric Her article was published in the neo conservative magazine, *Commentary* and reported to have supplied the ideological support for the US covert and overt acts of dirty politics during the Reagan and Bush era

With little organised countervailing power in the world scene today such US acts are likely to continue in a freewheeling manner justified by the political attitude of *realpolitik* which may receive occasional notice and criticism in the free press but are unlikely to be restrained by the public opinion One must also add that the writers and editors of the free press can be the target of a form of dirty politics of clever coercive control Many journalists reporting events in Vietnam Nicaragua San Salvador Panama and Gulf war for instance have complained that they were either denied correct information or faced 'friendly fire if they brought forward information which contradicted what the government and its political allies and supporters in the US and abroad pronounced The practice of *realpolitik* in modern times involves not only the covert and overt use of force as an integral part of coercive diplomacy but, also, its shrewd application shaping the timing and the nature of news flow in the media

ING BANK

INTERNATIONALE NEDERLANDEN BANK N.V.

(BOMBAY BRANCH)

(Incorporated with limited liability in the Netherlands)

(In Thousands of Indian Rupees)

Schedule 17: Notes to the Financial Statements for the Year Ended March 31, 1995

1. **Significant Accounting Policies**

(a) **General**

The accompanying financial statements of Internationale Nederlanden Bank N.V. – Bombay Branch ('the Bank') are prepared under the historical cost convention and conform to the statutory provisions and practices prevailing within the banking industry in the country.

(b) **Transactions involving foreign exchange**

(i) Monetary assets and liabilities in foreign currencies including foreign currency non-resident ('FCNR') account balances under the FCNR account scheme are translated at rates of exchange notified by the Foreign Exchange Dealers Association of India ('FEDAI') at the year-end. The resulting profits/losses are included in the profit and loss account.

(ii) Outstanding forward exchange contracts and spot exchange contracts are revalued at rates of exchange notified by FEDAI prevailing at the year end and the resulting profits or losses are included in the profit and loss account.

(c) **Investments**

(i) Classification of investments between permanent and current is as decided by the Management.

(ii) Permanent investments (Investments in Government Securities) are carried at lower of cost (including acquisition cost i e. brokerage paid) or market value and adjusted for amortisation of premium and accretion of discount over the period to maturity.

(iii) The market value of the quoted investments is Rs 50,060/- cost being Rs. 50,015/-. The source of market rate is Reuter's Screen/different foreign banks/N.S.E. indicator.

(d) **Fixed Assets**

(i) Fixed Assets are stated at original cost of acquisition (including taxes, duties, freight and other incidental expenses related to acquisition and installation of the concerned asset) less depreciation.

(ii) The assets are depreciated on the straight-line method at the rates prescribed by Head Office (ING Bank, Netherlands). Depreciation is charged to the Profit and Loss Account on pro rata basis from the month following the date of acquisition. The rates prescribed for each type of asset are higher than the rates specified in Schedule XIV of the Companies Act, 1956.

(iii) Cost of office and other equipment taken over by the Branch from the erstwhile Representative office of the Bank in Bombay have not been recorded in the books. Realization on sale of these assets is booked as Miscellaneous Income.

(e) **Revenue Recognition**

Interest income is recognized on an accrual basis in conformity with the procedure prescribed by the Reserve Bank of India

(f) **Staff Benefits**

(i) The Bank has created a separate recognized Provident Fund for employees. For Gratuity and Superannuation benefits to its employees, the Bank has made payments towards Group policies based on actuarial valuation by the Life Insurance Corporation of India. The Bank is in the process of getting the Gratuity and Superannuation Funds recognized by the Income tax authorities.

(ii) Bonus paid during the year is a contractual payment

(iii) Club memberships include Life Membership fees paid for Corporate members.

(g) **Net Profit/(Loss)**

The Net Profit/(Loss) disclosed in the Profit and Loss account is after providing for Interest Tax in accordance with the statutory requirements and other usual and necessary provisions.

(h) **Prior Year Comparatives**

The previous year figures are not shown as this is the first year of operations of the Bank in India.

(i) **Compliance**

The Bank has taken adequate steps to adhere to the guidelines and circulars issued by the Reserve Bank of India from time to time.

(j) **Advances**

No provision for doubtful advances is required to be made for the year, taking into consideration guidelines issued by the Reserve Bank of India in this respect

(k) **Head Office Administration Expenses**

The Branch has not debited Head Office Administrative Expenditure to its Profit and Loss Account but has claimed the same for tax purposes.

Auditors' Report on the Bombay Branch of Internationale Nederlanden Bank N.V. under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Bombay Branch of INTERNATIONALE NEDERLANDEN BANK N.V. as at 31st March 1995 and the relative Profit and Loss Account of the Bombay branch of the Bank for the year ended on that date, signed by us under reference to this report.

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section 227 of the Companies Act 1956, the Balance Sheet and the Profit and Loss Account together with the notes attached thereto are not required to be drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Forms 'A' & 'B' of the Third Schedule to the Banking Regulation Act, 1949.

1. We have obtained all information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit.

2. The transactions which have come to our notice have been, in our opinion, generally within the powers of the Bombay Branch of the Bank.

3. In our opinion, proper books of account as required by the law have been kept by the Bombay Branch of the Bank so far as it appears from our examination of these books maintained and produced to us in Bombay.

4. The above mentioned Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account.

5. In our opinion, and to the best of our information and according to the instructions given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, as amended in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at 31st March, 1995 and in case of Profit and Loss Account, of the Loss of the Bombay Branch of the Bank for the year ended on that date.

Development Critique in Culture Trap

Saral Sarkar

The cultural critiques of development by equating ecology and culture romanticise indigenousness and wrongly blame the west for pitfalls of industrialism.

IN the last 10 years or so, I have read books and papers and heard discussions in which critics of the hitherto dominant models of development (in the following only 'development') have introduced cultural arguments. I share their rejection of development, but I am very unhappy about what they say regarding traditional and/or indigenous cultures. I am afraid they are supporting in this way, without perhaps being aware of it, movements that are harming mankind.

Cultural Approach

I think we must now talk of two approaches to the critique of development: (1) the cultural and (2) the ecological-economic-political. The protagonists of the cultural approach do not wholly ignore the other approach. But it appears to me that for many of them, the main evil in development is that it destroys or suppresses the traditional/indigenous cultures of the south.

Wolfgang Sachs[1] maintains that the west[2] has in 1949 arbitrarily declared the peoples of the south to be underdeveloped and poor and then imposed or palmed off on them the idea and programmes of development, through which the whole world was to be made one unit and the ways of life of the various peoples uniform. This development has, according to him, caused the evaporation of cultures and languages and destroyed the modest/contented subsistence economies of the traditional cultures. The result of all that, according to him, is that these peoples have not only become poor but have also lost their cultural identity.

For Sachs, the slogan "one world" is a horror because it endangers the "self-willed ways of living and understanding", and because it restricts the space for self-determination and autonomy of the peoples of the world. He is aware of the dangers to the biosphere and of the logic of the "spaceship Earth". But his love of 'difference' and 'chequeredness' is very strong, and hence it is for him "a sacrilege to design the global space as a united, highly integrated world".

T G Verhelst (1990) brings in a few more points. He speaks of "the right of peoples to be different". Whereas Sachs is even against literacy programmes for tribal peoples who do not have a written language, Verhelst does not oppose development. But he criticises programmes for clapping the western model of development including western technology and culture on the peoples of the south. According to him, that is the reason why many partner groups reject or remain passive towards development projects. He interprets this as a form of resistance against imperialism. He thinks that the "failure to give due recognition to the indigenous cultures is one of the fundamental reasons for the failures and difficulties of 'development' work. He demands respect for all cultures and thinks that those NGOs which understand development work as a contribution to liberation should consider indigenous cultures as the foundation of development.

Such views have also been expressed in the south. Let me give a few examples from India. Smithu Kothari writes:

> And alongside this biological survival of marginal communities is the continuous threat to the survival of their cultures. The undermining of cultural plurality is thus built into the dominant model of 'progress' [Kothari 1985:8].

For Anil Agarwal and some ecologists of the south, an examination of the cultural and biological diversity of human society resulted in

> an understanding of the essential rationality of each culture, how it had emerged in its own particular ecosystem and the way people had developed social and production systems, behaviour patterns and survival techniques. Once this was understood, there was an immediate respect for all cultures... [Agarwal 1987:351].

I have also read articles and heard lectures in which Indian ecologists have maintained that India's religious and/or cultural heritage had the effect that the economy of ancient (or pre-colonial) India was very ecological and that 'Ahimsa' (non-violence) and 'Dharma' (right conduct) were/are parts of that heritage.

In the most recent article that I have read on this subject, S Kappen demands that "the right to... culture identity must be affirmed as a fundamental human right". He regrets that "neo-colonialism has a bridgehead in the denationalised sections of the middle classes..." and asserts that "a development that consists in the satisfaction of our... needs (he describes these needs with rather philosophical concepts as "ecotic, poietic, societal and noietic") will necessarily be culture-specific, that is, it will be one that reflects our conceptions and values and dreams and visions". In his opinion, "culture must body forth not only into the political organisation of society", but also into science. Our "approach to western science and technology" must be 'selective', "whatever science and technology we learn from outside must submit to the superior claim of our indigenous wisdom".

Cultural Identity Trap

The foregoing section is necessarily short and only approximately representative summary of the views I want to criticise here. It only illustrates a trend. It is not as if all the authors and speakers who represent this trend say exactly the same things. It is not always clear, firstly, whether the author or speaker means only the traditional cultures of the tribal and marginalised peoples or also those of the majorities among the various peoples of the south. And, secondly, it is not always clear whether one means by traditional culture the views and ways of life expressed and recommended in the ancient holy and philosophical texts or (also) the cultures *actually practised* in the past or the present. I have the impression that everything can be meant that is not western or westernised.

In order to avoid possible misunderstandings, it must be emphasised that participants in such discussions use the word 'culture' in its social-anthropological meaning, namely, "that complex whole which includes knowledge, belief, art, morals, law, customs, and any other capabilities and habits acquired by man as a member of society". In this meaning, 'culture' includes also "the material organisation of life, i e, social and economic institutions" [Edwards 1967:274].

My main criticism against the cultural approach is that for its rejection of development it uses argumentations which are not only wrong but also harmful, even dangerous in their consequence. Development should be rejected, but not because it is western or foreign. It should be rejected because it is ecologically, economically, politically and socially impossible and/or harmful, and that also in the west. Most

protagonists of the cultural approach would likely agree to the second part of the above statement. But then their cultural approach is at least unnecessary for their rejection of development

But their approach is also harmful – not only because it romanticises traditional/ indigenous cultures and so produces a false image of reality Where it can lead us to becomes clear when we read the following in a report on a conference on the new world order held in Germany (in free translation)

> Hans May, director of the Protestant Academy, agreed that even in the next few decades it would be impossible to equalise the standards of living in the Western and Eastern (former GDR) parts of Germany and accepted the idea that this impossibility should be compensated for by strengthening the regional identities of the Eastern parts He then proposed this as a model for the whole world The impossibility of achieving a standard of living in the South which is approximately equal to that in the North leads us to conclude that the *human rights must be differentiated and regionalised* May cautioned in this connection *against discrediting religious fundamentalism* [*Frankfurter Rundschau*, April 27, 1992]

Here the motive is not respect for all cultures or love of difference, but the fear of the south's aspiration to catch up with the north economically which is ecologically disastrous for the whole world In this connection, it is also necessary to draw attention to the fact that at the Human Rights Conference of the UNO (Vienna, June 1993), all human rights groups from the south insisted on the universality of the human rights Their slogan was "all human rights for all" It is only the rulers of some countries who wanted to reject this universality with the argument of cultural differences Obviously, they are also afraid of the aspirations of their own exploited and oppressed and women to catch up with the rich, the middle classes and the men I am not suggesting that all protagonists of the cultural approach explicitly share Hans May's conclusion But their emphasis on cultural difference and identity leads logically to such conclusions

But even for the development decades it is not wholly correct to say that the north imposed or palmed off its development models and culture on the south Most people in the south gladly accepted development and western culture or at least the greater parts of them In India, a National Planning Committee was constituted already in 1938 at the instance of the Indian National Congress According to a standard book on the history of India,

> broadly speaking, the objectives of planning were 'to raise the general standard of living of the people as a whole and to ensure useful employment for all' by the development of the resources of the country to the maximum extent possible, and by the distribution of national wealth in an equitable manner [Majumdar 1967 969]

And since the early 1980s, i e, long before Sachs and Verhelst published their criticism of western cultural imperialism, some European politicians have themselves been explicitly advising the south not to copy the west, maybe out of the same fear that Hans May has Edgar Pisani, in those days a leading politician of the European Economic Community (EEC) said "Divesting our relations (with the south-SS) of any hint of racism is to affirm we are different and we are going to stay different" [Verhelst 1990] Narducci, the then president of the EEC parliament, spoke of the "pernicious conviction that there exist superior cultures that must be asserted" and demanded 'intercultural dialogue' and "respect for specificity and cultural identity" [Verhelst 1990 149-50] In the Third Lome Convention (1984), also the EEC as a whole promised to 'promote the cultural identities' of the peoples of the ACP countries (former colonies of European powers in Africa and Caribbean and Pacific regions) and opined that development and be "based on their cultural and social values" [Verhelst 1990 150]

What brutalities and oppressions religious fundamentalism can lead to, we have seen in parts of the Islamic world, but also in India Think of the Babri masjid and its aftermath One could now argue that the cultural approach does not mean a religious approach But religion is a very important element of culture Cultural identity is, therefore, to a large extent religious identity Verhelst has explicitly subsumed religion in the concept culture And that is correct It does not help at all to obfuscate the matter by introducing unsound differentiations as S Kappen does He regrets

> While, on the one hand, religious revivalism and fundamentalism is cropping up in many parts of the world – which itself is a pointer to a loss of wisdom – people are losing their moorings in authentic religion

What is authentic religion? Is not the Sharia, the Islamic law book, and the decrees of the Popes part of authentic Islam and authentic Catholicism? And who knows what is and what is not authentic Hinduism? Is not the caste system a part of it? In which respects do the respective fundamentalisms differ from authentic Islam, authentic Catholicism and authentic Hinduism? All three have their infidels the Kafirs, the heathens, the Mlechchhas

But it is immaterial what one exactly means by cultural identity, laying emphasis on it causes separation between peoples, nations, ethnic groups, etc Of course, under certain circumstances, it can unite a group of people and so generate some solidarity within the group. But it can do so only by creating separation between this group and the others. Under unfavourable circumstances, the search for identity may easily end in a search for enemies. That can lead to end of peace and generate hatred, war, civil war or communal riots as we know them in India. In North Ireland it is a mixture of religious and national identities, in the former Yugoslavia it is a mixture of ethnic and religious identities, in the former Soviet Union it is a mixture of national, racial and religious identities, in the US it is the racial or colour identity and in India, in addition to all that, it is often also a linguistic one – Bengali, Assamese, Oriya, Tamil, Hindi, etc Of course, in such conflicts, there is almost always a deeper economic cause, but emphasising separate cultural identities makes finding a compromise solution impossible

Particularly for India, the emphasis on cultural identity constitutes a great danger. There is no such thing as an Indian traditional culture There is a Hindu traditional culture, but that is not the traditional culture of the Indian Muslims, a very large minority, or of the Indian Sikhs And there are also Christians, Jains and Parsis in India If S Kappen's idea becomes reality, then it would be Hindu traditional culture that would "body forth... into the political organisation" of Indian society Then it would be the end of the secular Indian state Then we would have created a Hindu Rashtra with consequences that do not need any elaboration

The opportunistic attitude of some in the west (like Hans May) towards religious fundamentalists and cultural and other kinds of identity fetishists will be of no use. For, in economic matters, the latter generally do not value any difference In economic matters, most of them – whether Hindu, Muslim or Christian fundamentalists or Buddhist or Confucian identity fetishists of Hong Kong, Singapore and Thailand – want to catch up with the north and contribute as much to the destruction of the biosphere as the industrial societies of Europe and America It, therefore, does not surprise anybody to see Iranian Ayatollahs processing with computers their holy scriptures in the library of Gom For the north industrial wealth and for the south cultural identity – this new ideology of imperialism is easy to see through

"We are different and we are going to stay different" – this ideology must be rejected for another reason. With it, the Americans can defend their ecologically destructive and exploitative 'American way of life' as their cultural identity With it, the Hindus can defend untouchability and almost all peoples of the world the subordinate status

of women These are/were indeed parts of the respective traditional cultures And in fact, in South Africa, the argument of different cultural and ethnic identities enabled even many liberal and nationalist-Christian whites to support racist Apartheid policies without having to use the discredited term 'race'

There are also people who, of course, reject development for ecological, economic and social reasons, but who, nevertheless, land in the culture trap Here is an example In the Singrauli region of Madhya Pradesh, India, some activists of a movement for defending the interests of the victims of 'development' expressed the view that the only alternative to development is to return to the past They spoke of the glory that was India before the British came They maintained that the villages of ancient and pre-colonial India were a happy world free from exploitation, that there were no famines then, that women then used to be treated as equals of men Although these assertions are all wrong, they are still expressions of some ideals But the culture of ancient India also contained caste discriminations So these romanticists also defended the caste system [Dhagamvar 1985] Another example is S Kappen from whose paper I have already quoted He also convincingly criticises capitalism and industrial civilisation from ecological, political and social standpoints But his solution is also a retrieval of the perennially valid insights of the past whatever that might mean

Alleged Wisdom of Traditional Cultures

One meaning of this phrase of S Kappen perennially valid insights of the past could be the alleged ecological wisdom of the ancients Without doubt most cultures that existed at the beginning of the industrial revolution had found some sort of ecological balance their economy must have been more or less adapted to their ecology Otherwise they could not have survived It is also a fact that in Egypt and parts of China and India peasants have been cultivating the same fields for several thousand years So their agriculture and, generally their way of life must have been ecologically sound They must also have had some ecological wisdom for after all, their livelihood depended to a much larger extent than today on the health of their ecology But they were also blessed by certain circumstances Firstly they did not have the technologies of today nor the fossil fuels with the help of which modern cultures are destroying the biosphere at a rapid rate Secondly the pressure of population growth was much less in those days And thirdly there was enough empty or thinly populated territory to which the part of the population that could not be fed any more could migrate Europe would have been ecologically ruined if America had not been discovered in the 15th century

But archaeologists and historians have unearthed a lot of evidence that shows that also the ancients destroyed their ecology in many parts of the world Only, in their case the process was very much slower than today, so slow that not many individuals could perceive it in his/her lifetime Clive Ponting (1991) gives several examples The Mediterranean region had experienced massive ecological degradation before its present landscape took shape It was due to the relentless pressure of long-term settlement and growing population expressed in deforestation for various purposes and overgrazing One of the main reasons for the collapse of the civilisation of the Mayas (Central America) was ecological degradation The Sumerian and the Indus Valley civilisations declined because of overirrigation resulting in waterlogging and salinisation of the agricultural land In north China, deforestation in the highlands plus agriculture on formerly grass-covered loess soils resulted in massive soil erosion which was the main cause of the often disastrous flooding of the Yellow river (so-called because of the colour of the huge amount of soil it carried)

In present day ecological literature we often read about the ecological wisdom of the peoples of the pre industrial eras One popular example is that of the Bishnois some 300 of whom sacrificed their life in order to protect trees [Tilting 1983] These Bishnois had a material interest to protect the trees that protected their village from the Thar desert of Rajasthan India But it cannot be overlooked that the king the axemen and the workers who wanted to fell the trees also had a material interest to do so viz to get fuel for producing lime which they needed for building a palace It was simply a case of conflict over resources in pre industrial pre colonial India Today also there are such conflicts e g the conflict in connection with the Narmada dams between those who would lose their land and those who would get water for their land In this respect at least there is not much difference between the past and the present except in the matter of tempo Ecologically the past was not more virtuous/wiser than the present

Finally let me quote the evidence of an ancient wise man on the effects of ecological wisdom of the ancients Plato describes the effects of deforestation and soil erosion in ancient Greece as follows

> What now remains compared with what then existed is like the skeleton of a sick man all the fat and soft earth having wasted away, and only the bare framework of the land being left there are some mountains which now have nothing but food for bees but they had trees not very long ago there were many lofty trees of cultivated species and boundless pasturage for flocks Moreover, it was enriched by the yearly rains from Zeus, which were not lost to it, as now, by flowing from the bare land into the sea, but the soil it had was deep and therein it received the water storing it up in the retentive loamy soil and provided all the various districts with abundant supplies of springwaters and streams whereof the shrines still remain even now at the spots where the fountains formerly existed [Ponting 1991 76]

The cases of ecological destruction revealed by archaeologists and historians might perhaps be dismissed by those who romanticise the past as isolated cases Perhaps such cases were really not very numerous But there is no doubt that in all traditional advanced cultures of the world – the Indian-Hindu the Arabic-Islamic the Chinese-Confucian etc, there was always and there is still exploitation and oppression violence and crime We know that in almost all cultures of the world hierarchy class or caste system and patriarchy have condemned large parts of the population to a permanently humiliated existence for no other reason than that they were born in the wrong family or as women And almost all cultures of the world including the tribal ones have waged wars It is not even true that the wise men of the ancient Indian culture were apostles of non violence The entire Bhagavat Gita is in exhortation for fighting a war And historians tell the tale of Hindu colonial and cultural conquests in south east Asia between the second and 16th centuries AD Jainism and Buddhism are non violent religions But they do not forbid economic exploitation of fellow human beings In view of these facts one cannot have respect for all cultures And except in the case of their economies which were probably more or less ecologically sound I do not see any 'essential rationality' in each traditional/pre industrial culture (not to speak of each modern industrial culture) The ancient Hindus did not create their caste system and untouchability in order to adapt themselves to their particular ecology And nowhere in the world did/does the ecosystem make it necessary that men should oppress women

In almost all societies there are (have been) contradictions and conflicts and some of them are (have been) related to cultural values There are (have been) struggles against exploitative oppressive, discriminating values, mores and customs, struggles against superstition and for scientific knowledge And in general, there are (have been) struggles for emancipation No culture deserves wholesale praise or wholesale contempt And all of them are inadequate for the difficult and complex tasks of today Today only dialogue and critical as well as differentiating solidarity are appropriate behaviour in the relations

between peoples belonging to different cultures

To be sure, there are (have been) tribes, among the members of which solidarity and mutual help is/was the norm But this norm is/was never extended to the members of the neighbouring tribes And the same tribes have/had no norm that prohibits exploitation or even massacre of neighbouring tribes (look at the Hutus, Tutsis and the Zulus, for example!) In any case, it is illogical to build up a whole ideology or an alternative paradigm on the basis of a few positive elements in a few exceptional cultures Equally illogical is to quote a few suitable sentences from the rarely read holy and philosophical texts of traditional advanced cultures and then to assert so is/was their culture The Bhagavat-Gita and the Upanishads were/are not expressions of the actually existing Hindu culture Just as little was/is the Sermon on the Mount an expression of the actually existing cultures of the Christians

Theoretical Error

A fundamental theoretical error of the protagonists of the cultural approach is to draw a parallel between ecology and culture They talk of ecological and cultural diversity in the same breath Diversity is absolutely essential and monoculture is very bad for the health of a particular ecology But for the health of a human society, it is not bad if all people in it speak the same language or wear similar clothes or worship the same God There is another difference A mango tree will not grow in Europe and an apple tree in south India But Christianity has thrived in the Philippines and Yoga has become very popular in Europe We have to oppose genetic engineering because of its dangers An artificially created bacteria may multiply and spread uncontrollably and cause irreparable ecological damages But an artificially created cultural or social institution can be abolished or counteracted if it proves to be harmful (whether the political decision to do that will be taken is another question)

Lewis Mumford one of the major philosophers of the eco-alternative movements in Europe and America, gives another reason for preserving the traditional (he says national and regional) cultures He wrote

> One of the great benefits of individualised national and regional cultures is that, if the opportunities are consciously seized, these potential alternatives can be experimented with under varied conditions and their advantages compared Any philosophy of history that takes account of natural and human diversity must recognise that selective processes in nature have reached a higher stage in man, and that any mode of organising human activities, mechanically or institutionally, which limits the possibilities of continued trial, selection, emergence, and transcendence, in favour of a closed and completely unified system, is nothing less than an effort to arrest human cultural evolution [Mumford 1970 159]

This is not convincing Firstly, he is reducing the national and regional cultures to the status of guinea-pigs to be experimented with Secondly, the argument here sounds like we should have a culture bank just like we should have a gene bank Neither is a very respectful attitude to other cultures And thirdly, it is the protagonists of the cultural approach who are trying to arrest human cultural evolution by demanding that traditional cultures should remain as they are or even become again as they were before But my argument against Mumford's observation is that neither cultural guinea-pigs nor a culture bank is necessary for his purpose In nature, if a species becomes extinct, it is gone for ever But we can, if we want, revive old extinct cultures or elements thereof Descriptions of old cultures and their various elements are available in books The revival of the Olympic games is a case in point Moreover, whereas genetic engineers need a gene bank for their experiments and creations we can use our fantasy and intelligence for creating entirely new social or cultural institutions, rules and regulations

What Do Peoples Want?

Protagonists of the cultural approach insist on the peoples right to be different the right not to become like the Europeans Alright but who is compelling them to be like the latter? Since the 1960s, all peoples of the world are at least politically free And since the early 1980s the Pisanis and Narducci and the EEC are even telling the peoples of the south to be different Nobody prevented us from using camels or bullock carts or wearing dhotis instead of trousers It is we who wanted to have cars and wear trousers and so on

Of course since the 1960s, the circumstances have changed and many indirect (economic) compulsions have come up But in principle, nobody would have any objection if a people (or a part of it) itself wants to revive preserve and practise its traditional culture as long as that does not harm others But what do the peoples want? What are their dreams and visions? There is no doubt at all that the great majorities of all the peoples of the south want to catch up on what the north has achieved in the areas of economy, science, technology, education, etc In addition to their own traditional art, literature, music, etc, they also want to learn and enjoy what the west has created in these areas One only has to look at the Hindus, Buddhists and Muslims in India, Thailand and Egypt and one would be convinced that it is so. Whether that is good or not is a different question There is no doubt that in social matters - e g, marriage and other ceremonies, rituals and customs in connection with birth and death - in religious matters and in matters of clothing, most peoples of the south practise their traditional culture to a great extent But this they do only so far as it does not stand in the way of their efforts to catch up with the north in the areas of economy science, technology and education

Protagonists of the cultural approach want that the indigenous peoples practise their traditional cultures But what do the latter themselves want? Let us take an example from India Siddharta, himself a protagonist and activist of the cultural approach, writes about the kurubas a tribal people of Karnataka

> Apart from imitating Hindu values they are also being influenced by western and commercial values communicated through the cinema Many tribal youth do not know tribal songs but will enthusiastically sing film songs in the Kannada language They still practise herbal medicine But modern medicine has made deep inroads For serious ailments many get admitted to government hospitals If the tribals are giving up some of their values it is not entirely because of the aggression of the capitalist economy To a certain extent they themselves want these changes The space that the modern period creates for the individual is exhilarating to many tribal youth who find some of the customs of the clan oppressive (like the authority vested in the yajamana or chief, for example) It must be admitted that the freedom of the individual and the space for that is an important gain [Siddharta 1991]

I think similar things more or less can be said also about other tribal peoples of the world also about the American Indians, also about those living in the forests of Amazonia

Industrial Civilisation and Capitalism

Why should the western culture be bad for the peoples of the south if it is good for the peoples of the north? Verhelst perhaps saw this question coming He writes 'Like the third world the west is suffering from cultural uprooting" That is also the opinion of Siddharta, who has lived many years in France This is confusing For, western culture cannot be uprooted by western culture Who or what is then uprooting it? At this point Verhelst suddenly makes other factors responsible for the evil, namely, the great Promethean adventure intensified during the last 300 years" and the modern culture through which many westerners have become 'egocentric' and "creatures of domination and competitiveness' [Verhelst 1990 72] With this analysis I fully agree In plain

English, these factors are called industrial civilisation and capitalism, the destructive results of which the protagonists of the cultural approach are actually criticising but wrongly attributing to western culture, which, according to Verhelst himself "contains much of great value". Industrial civilisation and capitalism (also the 'socialism' of eastern Europe was only a variant of industrial civilisation) are evil, not because they originated in the west, but because they are ecologically, economically, socially and politically destructive – both in the south and the north. The alternative programme of the critics should not, therefore, be a return to or retrieval of eastern, traditional, regional or national cultures, but an ecological and collective economy, an egalitarian and solidary society and a truly democratic political system – both in the south and the north.

Against the strong temptations of industrial civilisation and capitalist culture, appeals to love of difference, tradition and cultural identity have no effect. They do not convince. Also the existing religions with their long and not very glorious history do not convince any more. Especially Christianity that calls upon its followers to 'subdue' the earth and "have dominion over every living thing that moveth upon the earth" and all the religions that are oriented towards life in the next world are unsuitable as rallying points for saving the world. Actually, in this connection, we should differentiate between religion, ethics and spirituality. Like a baby, a religion demands total acceptance. As in the case of a baby, it is extremely difficult to accept only the good aspects of a religion and to reject the bad ones. What could probably convince are informations about and logical analysis of the great ecological, economic, social and political dangers arising from industrial civilisation and capitalism. But that alone won't do. It must be supported by a new ethics, the basis for which already exists in almost all human beings in the form of an ability to love and a sense of justice. No doubt, the human psyche contains also the abilities to hate, to kill, to be unjust and so on. But the struggle between the two sides of human character is not yet over. Creation of the new ethics and making people accept and practise it are the greatest cultural tasks of today and the near future.

We Need New Cultures

Some of the protagonists of the cultural approach have also recognised the need for change or reform, which must, however, according to them, remain within the framework of traditional/indigenous culture. For Agarwal, "the return to one's own culture" is "not a blind harking back to traditions" [Agarwal 1987:351]. Sachs writes, "The opposite of 'development' is by no means stagnation. ...From Gandhi's 'swaraj' to Zapata's 'ejidos' there are in every culture visions of change". But even this modification or attenuation does not remove the negative aspects and dangers of the slogan 'back to tradition'. Moreover, many and radical changes are necessary for solving the problems we are confronted with. But a culture that wants to change itself radically must be prepared to cease to be the same culture. If the Americans, in 20 years from today, give up their private cars and travel only by trams, trains, buses and bicycles, eat only vegetarian food and dissolve their armed forces – all necessary for ecological and humanitarian reasons – then that would no longer be the 'American' culture, but a new one.

Indeed, we must leave behind the traditional cultures as well as the modern industrial/capitalist culture, however much we might be in love with or used to them. We must create new cultures. We must not weep over the evaporation of traditional

SAGE Publications

JOURNAL OF HUMAN VALUES

Edited by S K Chakraborty *Indian Institute of Management, Calcutta*

The *Journal of Human Values* examines human values in the framework of their historico-social origins without ignoring the possibility of cross fertilization across cultures.

The Journal

- engages in a serious exploration of deeper and durable themes accumulated over the centuries, which lie embedded under what may appear to be insignificant in the present
- provides an international forum for the exchange of ideas, principles and processes concerning the application of human values to organizations and institutions and to the world at large
- carries critical essays, theoretical explorations and empirical studies

cultures. All hitherto existing cultures have proved themselves to be incapable of tackling the great crises mankind is confronted with today, crises which these cultures have themselves generated through their omissions and commissions. It need not be one single new culture for the whole of mankind, although I do not know any argument against it except that cultural diversity is a beautiful thing. By all means, we can have several new cultures in future. Why should anyone be afraid of the origin of new cultures? In the history of mankind, many cultures have disappeared and all cultures originated sometime in history as new cultures. None is there since eternity and for eternity.

The new cultures to be created must accept some categorical imperatives which were unknown to the hitherto existing cultures when they originated. The most important of them is the ecological imperative. They must accept the limits to growth – both to economic growth and to growth of population. A large number of children must not be considered as God's gift. Nor must the desire for a private car or at least one son be respected.

And they must accept the imperative of equality. Without equality there will be no peace, neither in a society nor among the peoples of the world. All the ideals of Enlightenment and the French Revolution did not bring peace because the principle of equality was reduced to mere equality before law. In the name of right to property, great inequalities in income and wealth were legitimised. In the name of freedom of contract, exploitation of fellow citizens was allowed. And in the name of 'white man's burden', colonial conquest, plunder, oppression and slavery were declared as a civilising mission. The west's betrayal of the ideals of Enlightenment and the French Revolution is the original cause of today's counter-Enlightenment of all kinds – religious fundamentalisms, racisms, nationalisms, ethnic expulsions, xenophobia, etc. It is mainly under conditions of exploitation, oppression, discrimination or contempt by another people, which is somehow dominating, ruling or superior, that an excessive, morbid, separatistic need for identity arises. It may be called cultural identity, but it may be based on anything: nation, tribe, race, clan, caste, religion or language. But also a return to the genuine ideals of Enlightenment is no longer adequate. Even if they were realised, that would not solve the problems. For, even the philosophers of Enlightenment were not aware of the ecological and demographic problematique.

Siddharta reports about the kurubas that "they lived as a group and their collective responsibilities were sacred. If somebody did not have food, he did not starve. The tribe saw to it that he had enough to eat". In general, they had a collective spirit. This value must be defended, revived and developed further – not because it is part of the traditional culture of the kurubas but because it is good for them as well as for the whole mankind, and especially because it is the right value for the great tasks ahead. This value is necessary for peace and ecological transformation of economy. Where it does not exist (any more), it must be created anew.

There is no rule that the ideas and impulses necessary for the radical changes must originate in the particular culture concerned. In the history of mankind, all peoples have learned a lot from one another. The Europeans took over Christianity from the Palestinian Jews. Gandhi learned a lot from Tolstoi, Ruskin and Thoreau. And many Europeans and Americans have learned much from Gandhi and LaoTse. Why should we then be suspicious of the slogan 'one world'? The laws of nature are the same for all peoples and the earth is one from the very beginning. Also the world of the various peoples must become one for several purposes. The most important of them is solving the global ecological problems. But also for solving the local ecological poblems and the problem of hunger in the poor countries of the south, global co-operation and help from the rich countries would be necessary, at least for the next two or three decades. 'One world' need not necessarily mean the one world conception of the GATT, the World Bank, the IMF and the TNCs. Necessary for the process of making the world one in our sense is – apart from dialogue, solidarity and mutual help – also constructive criticism and self-criticism among those minorities in all peoples who want to change the world and so save it. Nobody is saying that the Europeans and Americans must take the initiative in changing the traditional cultures of the south. But if some people in the countries of the south are struggling to bring about the necessary changes, then it is legitimate and necessary that their political friends in the north help them with moral and concrete support. For example, when Taslecma Nasreen is struggling in Bangladesh against Muslim fundamentalism, it is the duty of all people in the world who share her views in this matter to amplify her efforts by criticising Muslim and all other religious fundamentalisms. Similarly, it is legitimate and necessary that we in the south criticise Euro-American culture, not only because it is exploitative and ecologically destructive but also because it violates human rights through discrimination against the blacks and foreigners and by rendering hundreds of thousands of Europeans and Americans homeless.[3]

I am not afraid that the world of the future will know only one monotonous culture. The future ecological and decentral eco-nomies and the various new institutions of the different regions would provide enough space for new and differe expressions of economic, social, political, religious, spiritual, literary and artistic life of the various peoples. But we must not forget that the peoples of the world are only so many variants of the same human species. The similarities between them are much greater than the differences. I do not mean by it only the species-similarities. The peoples of the world are not only biologically similar. Psycho-analysts have shown that also their psyches and unconsciouses are similar. They dream similar dreams. Also their cultures are largely similar. Institutions like marriage and family, belief in a God or in gods and goddesses, priesthood, temples, etc, artistic expressions like poetry, music and dance – all these things are almost universal. They existed among most peoples even before they had contacts with each other. So, also culturally, we are one mankind.

Notes

1 Wolfgang Sachs: Zur Archaologie der Entwicklungsidee (an essay in 6 parts), in *EPD-EP*; different issues, 1989. (The essay has also appeared in English, but I cannot give the details. English translation of the title: On the Archaeology of the Development Idea.)

2 The two terms 'West' and 'North' mean in discussions of this kind actually the same thing. 'West' is generally used when the subject matter is culture, 'North' when it is development. I have had to use both because my subject matter is both culture and development.

3 In the Universal Declaration of Human Rights of the UNO (1948), dwelling is explicitly mentioned as a human right (Article 25/1).

Land Reforms and Agrarian Change in Karnataka

Surinder S Jodhka

Land Reforms and Changing Agrarian Relations by C B Damle Rawat Publishers, Jaipur, 1993 IX + 249, Rs 325

I

IT is rather surprising that despite the large volume of literature available on the successes and failures of land reform legislations from different parts of the country not many micro level studies have been carried out to understand the consequences that land reforms might have had on the related aspects of village life such as agrarian relations rural power structure changing caste equations and poverty This can perhaps be attributed to the fact that much of the literature on post independence developmental programmes has ignored the significance of a historical perspective and the need for understanding various aspects of the changing agrarian structure in relation to one another [Pandey 1994] It is in this context that C B Damle's book becomes an important contribution to the existing literature on agrarian processes in contemporary India

The novelty of Damle's study lies in his ability to combine a historical perspective with a field study of four villages Damle selected two villages each from a subsistence and commercial setting for his field study in the Dakshina Kannada (DK) district of Karnataka One village in each setting was known for successful implementation of land reforms and the other was selected from amongst the low implementation villages This made his research design for the field study doubly comparative

Damle attempts to deal broadly with two questions First an analysis of the specific context and the various relevant factors affecting the implementation of different land reform legislations in the DK district And second the way these legislative measures have changed the agrarian structure in a micro setting With this what P C Joshi in his foreword to the book describes as 'comparative historical approach Damle tries to show how much of the claims about radical nature and successful implementation of the 1974 Land Reform Act is a myth Looking at it together with the negative effects of the 1961 legislation Damle argues that the overall impact of the 1974 Act on the agrarian structure of the DK district has been very limited He also tries to show how even in the success villages the 1974 Act did not lead to any radical change in terms of the land ownership patterns or the social inequalities

Damle identifies two necessary conditions for the successful implementation of land reforms First an active political will and second socio-political consciousness and organisational strength of the tenants For optimal results the two have to be present simultaneously While the government intervenes from above, the suppressed classes have to play a complementary role from below (p 17)

The first two chapters of the book spell out objectives location and framework of the study The third and fourth chapters are largely historical in nature In the rest of the book Damle discusses the findings of his field study

II

Before the advent of the British rule the agrarian situation in the South Kanara region was a curious blend of peasant proprietary system and a system of sub infeudation with landlords tenants sub tenants and bonded labour representing different layers of interest in land locked in ties of mutual dependence (p 31) Like other parts of the country British rule had brought about significant changes in the agrarian structure of the region The two crucial changes that came about with the raiyatwari settlement were (i) a gradual but significant increase in the incidence of tenancy and (ii) growing practice of land mortgages often resulting in the alienation of land This was made possible by the conferment of formalised private ownership of land by the colonial regime This trend continued till the middle of the 20th century Between 1901 and 1951 the number of tenants in DK district went up by 125 per cent (p 45) As it is well known this was a pan-Indian phenomenon

It was in this background that land reforms were seen to be necessary for any kind of positive economic change with social justice and for creating a social base for a democratic system of governance

Though the present state of Karnataka came into existence in 1973 different legislations were being passed since 1948 that affected one or the other part of the state (earlier known as Mysore state) Most important of these was the Mysore Land Reforms Act of 1961 The main objective of this Act was to provide security to the tenants against eviction The act also imposed ceilings on landholdings and with the exception of those cultivators and agricultural labourers who wanted to self-cultivate, nobody could buy agricultural land

This Act turned out to be a farce Though it was framed in 1957, the Act was implemented only in 1965 and that too with a number of loopholes The landlords got enough time to take care of their interests A large number of tenants were evicted in the name of 'resumption for self cultivation To avoid ceilings mala fide transfers of land under different names were carried out during those eight years In the context of a near complete absence of political will' the Act ended up harming the interests of those whom it claimed to benefit

The main contention of Damle is that the real impact of the much celebrated 1974 Act cannot be understood without giving due consideration to the negative' impact that the 1961 Act had particularly in the case of tenancy reforms By the time the radical tenancy legislation was tabled in the state legislative assembly for enactment in 1974 nearly 78 per cent of the tenants had already lost their occupancy rights because of their evictions mostly on the flimsy ground of resumption for self cultivation (p 65) However the author does not completely dismiss the positive impact of the 1974 Act His main contention is that the impact has been much lesser than what it has been made out to be Much of this confusion has been created by a shift in the base year to 1970 71

III

To examine the impact and dynamics of land reforms at micro level Damle shifts to a discussion of his field study in his fifth and sixth chapters The two level comparative analysis i e between subsistence and commercial setting on the one hand and between success and low implementation villages on the other helps him draw some interesting conclusions

His first argument is that more than anything else it was the ability of the contending classes to mobilise their strength and resources that mattered If tenants organised themselves, the chances of their being able to get ownership rights over land were more and if landlords got together, they succeeded in defeating the legislation Similarly where landlords came from non cultivating upper castes and were largely absentees, the chances of tenants getting their way was more than in situations where landlords came from cultivating middle-

upper castes who had more direct interests in the land

Second, the land reform legislations were more effective in the subsistence paddy cultivating areas than in the commercial plantation villages. And interestingly, in both the settings, most of the transfers took place among the upper and middle castes implying that even where the land reforms were successful, the beneficiaries came from the upper and middle castes and rarely from the dalit caste groups.

However, land reforms, even where successful, had not been able to alleviate the economic status of the beneficiaries much. Though the ex-tenants had become landowners (even the agricultural labourers who got homestead land were no more 'landless') most of them had unviable holdings and these holdings were getting further fragmented This process was more pronounced in the subsistence setting where the proportion of unviable holdings among the middle castes was as high as 86 per cent. Hence, most of them had to look for alternative sources of employment, including agricultural labour.

The situation in the commercial setting was better. A higher proportion of the ex-tenants had stopped working as wage labourers and had become self-sufficient. Damle also suggests that the overall economic development had been comparatively more in the commercial setting than in the subsistence setting. Consequently agrarian relations in the commercial setting had become more formalised while the elements of 'patron-client' types of dependency ties were still visible in the subsistence setting However, in both the settings there had been an overall increase in the number of agricultural labourers, particularly casual labourers This too had been a consequence of the land reforms Many of the ex-tenants who got evicted had joined the ranks of the agricultural labourers.

However, Damle's discussion of the field study seems to have very little continuation with the earlier chapters based on secondary and historical source material. For example, the 'political will' factor has almost been completely bracketed out while assessing the causes and consequences of land reforms in the study villages.

Apart from the land reforms, another factor that Damle feels has played a critical role in bringing about some positive economic change in the DK district has been the availability and growing popularity of the institutional sources of credit. Credit plays a crucial role in reproducing dependency relationships in agrarian societies [Brass 1990; Jodhka 1994]. And in a context such as this the relations of credit assume particular significance for any discussion of changing agrarian relations.

However, Damle's claim that the "private credit system' had declined significantly and the credit needs of almost all the categories were being met by the institutional sources sounds a little premature specifically in light of his own claims regarding the growing fragmentation of holdings, their becoming unviable and there being virtually no increase in the income of landless labourers. Even if insignificant in quantitative terms, the nature of dependencies that the borrowings by landless labourers and marginal landowners from big landowners could be of crucial significance for a sociological analysis of the agrarian structure

The author's framework of agrarian classes is also rather loose. Analysis of agrarian class structure has a long tradition particularly in Marxist scholarship. Damle not only ignores the classical writings (of particular significance here would be the contributions by Lenin, Mao and Kautsky), he also bypasses the Indian debate on the subject He tends to operate purely at an empirical level to the extent that his framework of agrarian classes differs from chapter to chapter and setting to setting The usefulness of concepts like class lies in their abstract nature and their applicability in varied empirical contexts as heuristic devices. This becomes particularly important in a comparative study like the one that Damle has done.

In the same way his attempt to differentiate the class of 'rich landowners' and that of 'big landlords' sounds a little too economistic when both seem to come from similar caste backgrounds and not always were his 'landlords' purely absentees going by his own observations in the case of the Shirlyara village (p 125). Similarly, putting medium, small and marginal landowners together in one category does not make much sense particularly in the light of the critical significance that has been assigned to the 'middle peasantry' in the literature on peasant societies.

Though it is difficult to expect completely flawless printing, repeating a whole paragraph (pp 197-98) could have easily been avoided had the editors been a little careful.

However, none of these problems rob the book of its value as a useful contribution to the growing sociological literature on agrarian processes in contemporary India.

Concept

THIRD REVOLUTION IN INDIAN PERSPECTIVE

V.S. Gupta

200 pp	(599-0)	Hardbound	Rs. 325

The book relates communication technologies and their relevance to the important and basic issues confronting the country at present: Women Empowerment, National Unity, Environmental Protection and Rural Development, etc. It dwells upon certain aspects including socio-cultural impact, the gap between the information-rich and the information-poor, the impact that TV and cable programmes are likely to have on young minds, as also the awareness compaigns launched by NGOs and other voluntary bodies and academic organisations.

V. S. Gupta, is professor at the Haryana Agricultural University, Hisar.

A Sane Nuclear Policy

A G Noorani

Indo-Pak Nuclear Standoff: The Role of the US by P R Chari; Manohar Publishers, Delhi, 1994; Rs 350.

A NATION'S sanity, as that of an individual, is put to test when the peril touches survival itself As it is, discussions on foreign policy in India and Pakistan reek of chauvinism, dressed in self-righteous rhetoric which never succeeds in concealing double-standards. This book is an outstanding exception. It is a powerful plea for sanity in nuclear policy. What is more, it is extremely well documented and fairly sets out and analyses contrasting viewpoints. Published under the auspices of the Centre for Policy Research, New Delhi, it is in a sense a working paper for the policy-maker and analyst. The relevant material is cited in the book, options are defined and conclusions stated. The reader who disagrees with the analysis on any point will be able to pursue the leads since nothing is suppressed from him.

A carefully calibrated policy has to chart a course in the grey zone. The author charts such a course throughout. He rightly dismisses the exaggerated fears voiced by the Americans, with calculated persistence, as also some versions of the nuclear capabilities of India and Pakistan Yet he points out that the situation is grave enough and the balance of terror is far less stable than many imagine. The two states have never had a dialogue worth the name on their relations in the nuclear field. They have spoken to each other mainly through the US which has its own agenda. Minister of state for external affairs K Natwar Singh said on November 8, 1986 that it was "irrelevant to say 'talk with Pakistan'" on the nuclear question. "It is a global problem and Pakistan has a role to play as a proxy of the US. That is why it is not bilateral." The Rajiv-Zia accord on talks on October 23, 1985 in New York was swiftly aborted.

Robert L Gallucci, now US negotiator with North Korea, said in 1993, "if a nuclear weapon is to be detonated in anger in the next five years or so...the most likely place would be South Asia .. I see countries that are contiguous, both able in the near-term to deploy nuclear weapons if they so chose, both with some delivery capability and both moving in the direction of ballistic missile capability that could be applied to nuclear weapons These are countries that have fought before and that have a near-term crisis that could erupt at any moment in Kashmir." The CIA's director, James Woolsey, had the same tale to tell. India and Pakistan present "the most probable prospect for future use of weapons of mass destruction".

The Clinton administration's second report to the US Congress, submitted on February 8, 1994, on *Progress toward Regional Non-Proliferation in South Asia* states: "We continue to believe that both India and Pakistan could assemble a limited number of nuclear weapons *in a relatively short time*. India and Pakistan have combat aircraft that could be modified to deliver nuclear weapons. Both are developing or seeking to acquire ballistic missiles capable of delivering nuclear or chemical weapons. Such weapons have the potential of striking major population centres in the other country." (Emphasis added by the author.)

The author's comments are apposite: "Whether they do possess nuclear weapons is a matter of speculation. But the consensus of opinion is that the period intervening between a decision to acquire nuclear weapons and its availability to them has been reduced to weeks. Following several recent crises in their bilateral relationship, e g, in early 1987 during the Brasstacks exercise, and mid-1990 following a troop build-up on the Indo-Pak border, this time-frame could have been reduced further to days."

India displayed its nuclear weapons capabilities two decades ago on May 18, 1974 with the Pokharan explosion. The author is one of the few in this land to assert in print that it was a mistake, which indeed it was. One wishes someone would do a study on that event alone. Why did Indira Gandhi give the green signal when she did? What were the considerations that governed her decision? Those of domestic politics? For, every relevant consideration militated against it. The author cites some. One might add the ongoing talks with the US on joint determination to start the reprocessing plant at Tarapur. A test made sense only when we were out of the woods. In 1974 we were not. Israel has not tested a nuclear device but has fostered the impression that it has nuclear weapons.

The author sums up the debate in India and Pakistan on their respective nuclear postures, holding the scales even while doing so. The two took different routes. "India's route, deriving from its nuclear energy programme, would be based on plutonium derived from its natural uranium fuelled, heavy water cooled and moderated reactors, and separated in its established reprocessing facilities. By contrast, Pakistan would follow the uranium path, based on its centrifuge enrichment capabilities. A further significant difference between their military-nuclear programmes is that India's nuclear option is derivable as an offshoot of its diversified atomic energy and space programmes, whereas Pakistan's option is more narrowly focused on its enrichment facilities and limited missile capabilities. These circumstances make it possible for constraints and denial regimes to target Pakistan's relevant nuclear programme more easily than is practicable with India."

There are three fundamental differences between the two. India's programme is under firm civilian control. In Pakistan it is the armed forces who rule the roost. For all the circumspection it exercises, India has been vastly more open about its programme. Not so Pakistan. Finally, Pakistan's uranium enrichment programme has no nuclear reactor to fuel.

India is miles ahead of Pakistan. "It is believed incidentally that India is 'showing an interest in materials that are necessary for the development of thermonuclear, as distinct from only nuclear weapons'. It also has a nuclear-powered submarine (Advanced Technology Vessel) programme based on the Charlie class SSN (INS Chakra) that it had leased and later returned to the former Soviet Union. Enriched (20 per cent) uranium would find use in a reactor to power submarines. Despite routine disclaimers that 'India does not have any regional or international ambitions and the country's naval capability is being only tailored to guard the long coastline and the exclusive economic zone', the strategic direction of all these developments is clear and would explain the interest revealed by India in uranium enrichment technology."

Both countries have embarked on missile programmes whose objective cannot be in doubt. "The question remains to be satisfactorily answered as to how this missile, or the Agni, could be cost effectively deployed unless they are equipped with non-conventional warheads."

Against this background, Chari proceeds to discuss the options open to the two countries pointing out, however, the asymmetry in their respective situations.

India has to reckon with China. Pakistan is virtually an ally of China. It is all too obvious that despite the significant improvement in Sino-Indian relations, China has not given up its objective of containing India on the subcontinent.

The options vary from establishing a minimum deterrent posture based on untested nuclear devices to overt nuclearisation. A sense of realism is injected in the appraisal of the options. "Any nuclear force contemplated by India would need to configure into planning exercises the need to deter both Pakistan and China. A nuclear force based on first generation fission weapons that could be delivered by aircraft or short-range surface-to-surface missiles would serve as a plausible deterrent against Pakistan. But the requirement of nuclear forces *vis-a-vis* China would be quite different and would need to include a minimum deterrent force of relevance against China. At the very least the Agni IRBM would require *deployment in a land-mobile configuration* to ensure their survivability, because *it would need emplacement near the Sino-Indian border* to acquire value targets in mainland China.

"A nuclear warhead miniaturisation effort, coupled with a regular missile testing programme, would be unavoidably necessary if Agni is to be deployed. Assuming that such a test series is possible and is effected, the nuclear forces that India would have to deploy for establishing deterrent capabilities against Pakistan and China would in totality need to be fairly sophisticated and considerably more technologically advanced than a rudimentary nuclear force that may suffice in the Indo-Pak context." Are we prepared for that now? "The question whether missile deployment would stabilise or destabilise Indo-Pak relations is unanswerable with any degree of finality. All that can be said is that *their deployment would raise mutual tensions and the destructiveness of future conflict to a higher plane.*" (Emphasis mine.)

Neither India nor Pakistan is prepared to 'roll back' its programme. Each keeps the option open. But this has a price and it cannot last long. "A nuclear posture premised on ambiguity and uncertainty is essentially contrived, and could not be continued *ad infinitum*". Here the author delivers caveats which might bruise egos and disturb complacency in both places. He pours cold water on their claims to nuclear prowess and proceeds to question comforting assumptions that the present nuclear stand-off stabilises or that an overt nuclear deterrent will provide stability to Indo-Pak relations.

"It is possible to conclude at this stage that sweeping generalisations suggesting that nuclear weapons could either stabilise or destabilise Indo-Pak relations are not possible, because these are irresoluble propositions and would hopefully remain unproven assertions. So much is certain Nuclear weapons introduce a new and qualitatively more potent danger to the obtaining Indo-Pak impasse. This has proven to be recurrently crisis-ridden and becomes apparent from the history of their relations over the last decade."

Two Indo-Pak nuclear crises are cited at some length. One occurred during the course of the Brasstacks exercise (1987) and the other following a reinforcement of Indian troops in Kashmir in 1990 in the wake of the outbreak of militancy in the state. The first is the subject of a study by the author and other scholars entitled *Beyond Brasstacks*, due to be published in August by the publishers of the present work. Shirin Tahir-Kheli's forthcoming book *Lessons for the Future: The Gates Mission to India and Pakistan* deals with the 1990 crisis during which president George Bush sent his deputy national security adviser, Robert Gates, to the subcontinent. (Shirin Tahir-Kheli held high positions in the Bush administration.) It seems that the fears on both sides were exaggerated, thanks to lack of communication and paucity of intellectual equipment and understanding.

Pakistan is ruled by its troika – the army, the prime minister and the president. India has a prime ministerial system. But, as practised in the last two decades, it has seen the virtual collapse of the cabinet and the transfer of "effective power to the prime minister's office (PMO) which has grown to gargantuan proportions and sits in judgment over the entire processes of government. In times of crisis the locus of decision-making shifts from the concerned ministries/departments to the PMO where individuals with limited knowledge and experience advise the prime minister and ultimate decisions are taken. Again, this narrowing down of the decision-making base, dependence on a coterie of favourites, and by-passing the normal processes of administration is a prescription for large failures." This has played havoc, not least under P V Narasimha Rao whose indecision and incapacity for leadership are legendary.

Chari takes the reader through the talks which India conducted with the Clinton administration as also the ones between the foreign secretaries of India and Pakistan followed by exchanges of non-papers.

What conclusion do we draw from all this? All efforts to develop truly effective CBMs have failed. "The more pertinent conclusion possible at this stage is that nuclear weapons have no relevance to the real security problems lying between India and Pakistan. This is their promotion of subversive activities in each other's territory. The ensuing loss of lives, damage to public property, exacerbation of social tensions, disruption of economic activity and setbacks to their internal political processes far exceeds that caused by all past Indo-Pak conflicts. The expected or assumed stabilising effects of nuclear deterrence in the Indo-Pak context are therefore largely illusory because they have no relevance to addressing this range of their real security problems."

On this aspect, two points may validly be made. India had within its power to settle the Siachen problem, but resiled from a concluded accord in 1989, aborted the conclusion of another accord on it in November 1992 and in January 1994 falsely claimed that an accord had been reached in 1992 and should be enforced now. Pakistan saw in it a ploy to divert attention from Kashmir and refused to co-operate. (For details see this reviewer's article, 'The Siachen Affair: Obduracy and Media Manipulation', *Frontline*, June 3, 1994.) The 1989 and 1992 episodes deserve greater attention, not only to cure self-righteousness but to expose the cavalier treatment of a grave problem which costs human blood.

On Kashmir, the main issue, India's stand is disingenuous. It denies the existence of a dispute, asserts that it is an internal matter, asks for talks under the Shimla Agreement but says no negotiation is possible. It rejects mediation but does not mind US ambassador Frank Wisner intervening on its behalf by counselling the Hurriyat leaders to participate in elections. It ignores the fact that the people of Kashmir are totally alienated from India, albeit disenchanted with Pakistan as well. The one flaw in Chari's admirable work is that it does not reckon with India's intransigence on the main dispute, Kashmir, on Siachen and on the nuclear aspect of its relations with Pakistan.

This is all of a piece with the style of diplomacy revealed in relations with Sri Lanka and Bangladesh as well. Not surprisingly, the card-carrying nuclear hawks – the noise they make should earn them a different appellation, 'nuclear jays' – are the ones who support these policies. Great power delusions warp nuclear policy and diplomacy alike. The result is not greater security, but far less than was obtainable.

INDIA BRANCH

Schedule 17—Notes forming part of the Accounts as at March 31, 1995

I. Significant Accounting Policies

a) General

i) The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

ii) Revenues are accounted for on accrual basis except interest on advances classified as "non-performing" according to the prudential accounting norms prescribed by the Reserve Bank of India

b) Transactions involving foreign exchange

i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the financial year except Foreign Currency Non Resident account balances which are carried at the rates specified by the Reserve Bank of India or at the spot rates of swap contracts, as applicable.

ii) Outstanding foreign exchange contracts and contingent liabilities on account of outstanding forward exchange contracts are at the contracted rates and have not been revalued

iii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction.

iv) Profit or loss on outstanding forward contracts is accounted for on accrual basis.

c) Investments

i) Investments in Approved Securities which are intended to be held till maturity, are classified as "permanent investments". The classification into 'permanent' and 'current' categories is in the ratio of 70:30 in accordance with the Reserve Bank of India guidelines. Permanent Investments are carried at cost and premium if any, is amortized over the remaining period of maturity.

ii) All other investments which are held on trading account are classified as "current investment" and are valued as under:-
— 'Quoted' investments are valued at 'lower of cost or market value'. In the absence of market quotations, such investments are valued at lower of cost or value ascertained on yield to maturity basis in accordance with the Reserve Bank of India guidelines.
— 'Unquoted' investments are carried at 'Cost' or valued on 'yield to maturity' basis whichever is lower.

iii) Provision for diminution in value of current investments is ascertained on an aggregate basis by category of investment.

d) Advances

i) Advances are net of provisions for loan losses made in conformity with the norms laid down by the Reserve Bank of India.

ii) Provision for loan losses is based on their classification into "performing" and "non-performing" assets in accordance with Reserve Bank of India guidelines Provision for non-performing assets is made as under:

Sub-standard assets	- 10% of net advance
Doubtful assets	- 100% of the unsecured portion and 20% to 50% of the net secured portion depending on the period for which the asset has remained non-performing
Loss assets	- 100%

e) Fixed Assets

i) Fixed assets are accounted at their historical cost except 'Premises' which are revalued and are accounted for at the values determined by Government Approved Valuers The surplus on revaluation is credited to Revaluation Reserve. The premises were last revalued as on 31st March, 1993.

ii) Depreciation is provided for on the diminishing balance method at the rates specified in Schedule XIV to the Companies Act, 1956.
In respect of additions during the year, depreciation is provided with effect from the half year in which the addition is made.

iii) Depreciation in respect of revalued assets is provided on the revalued amount and charged to the Profit and Loss Account

f) Staff Benefits

Contribution to the approved Gratuity Fund has been made as per valuation by an actuary.

g) Revenue Recognition

Income is recognised on expiration of time basis except interest on non-performing advances and guarantees/letters of credit commission which are recognised on realisation basis

h) Profit and Loss Account

Provisions and Contingencies include:

i) provisions for taxes on income in accordance with statutory requirements,

ii) provision for loan losses,

iii) provision for diminution in value of investments,

iv) transfers to contingency and other funds,

v) other usual or necessary provisions, and

vi) bad debts written off.

II. Provisions and Contingencies include Extraordinary and Prior — period charges on account of interest and penalty levied by the Reserve Bank of India - Rs. 21,533,425.

III. The Bank has entered into an agreement for settlement of its dues by the owners/landlords of one of its erstwhile premises. Under the agreement the bank has received back its deposit together with interest. Moreover, the other co-tenants who had filed claim suits against the bank aggregating to INR 70,578 have, in principle, agreed to withdraw the suits on final clearance from the respective authorities for reconstruction of the building. The management is of the opinion, that these suits will be shortly withdrawn.

IV. Previous year's figures have been regrouped/rearranged wherever necessary.

BANQUE INDOSUEZ

(Incorporated in France with Limited Liability)

INDIA BRANCH

Auditors' Report on the Indian Branch of Banque Indosuez under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Indian branch of Banque Indosuez (incorporated in France with limited liability) as at March 31, 1995 and the relative Profit and Loss Account of the Indian branch of the Bank for the year ended on that date annexed thereto

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of Section 211 of the Companies Act, 1956

We report that

(1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory

(2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian branch of the bank

(3) In our opinion, proper books of account as required by law, have been kept by the Indian branch of the bank so far as appears from our examination of these books

(4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian branch of the bank dealt with by this report are in agreement with the books of account

(5) In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956 in the manner so required for banking companies, and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at March 31, 1995 and of its profit for the year ended on that date

Agricultural Growth and Agrarian Change in West Bengal and Bangladesh

Ben Rogaly
Barbara Harriss-White
Sugata Bose

Drawing on papers presented in a workshop held in Calcutta in January 1995, this article reports on debates over the nature of the relationships between agrarian structure, agricultural growth and the state in West Bengal and Bangladesh. It scrutinises reports of rapid agricultural growth in West Bengal (and less spectacular but still significant agricultural growth in Bangladesh) since the early 1980s and expands the concept of structure to include structures of commerce, of bureaucracies, of exchange arrangements in land, water and labour, as well as changing ideologies of gender, caste and ethnicity. The local impact of the West Bengal Left Front government's agrarian reforms (including Panchayati Raj) are also analysed and trends in poverty in the two Bengals since 1980 are examined.

I
Introduction

SINCE the early 1980s there has been a rapid increase in the output of rice in West Bengal [Saha and Swaminathan 1994a, Sawant and Achuthan 1995] after decades of mediocre performance.[1] Rice output is also said to have increased rapidly in Bangladesh [Palmer Jones 1992].[2] Both of these observations contradict the implications that might have been drawn from Boyce's earlier work on the two Bengals for the period 1949-80 [Boyce 1987]. Boyce suggested that elements of the agrarian structure, including inequality of landholdings, stood in the way of growth in output. Disputes between relatively large landowners as well as sabotage by those without productive assets prevented the expansion of water control – the critical input.

To examine the apparent contradiction between structure and growth a workshop on 'Agricultural Growth and Agrarian Structure in Contemporary West Bengal and Bangladesh' was held in Calcutta from January 9 to 12, 1995.[3] The workshop was organised in thematic sessions beginning with historical overviews of the relationship between agrarian structure(s) on the one hand and agricultural growth and decline on the other. There followed an examination of the evidence on growth in agricultural output and discussion of the contrasting policies of the government of Bangladesh and the state government of West Bengal. Attempts were made by some authors to link changes in output to government policies. Others focused on the dialectic between agrarian structure and agricultural growth.

The workshop aimed for intellectual eclecticism and got it. While some took a technocratic view of policy, others held that policy should be examined in terms of its practice rather than its stated intentions. Agrarian structure was also deconstructed. It might be more accurate to talk about 'agrarian structures'. While some analysed agrarian structure in terms of the distribution of land among the rural population, it became clear that control over tube-wells was of special significance, particularly in rice producing areas with highly fragmented landholdings. Others drew attention to the structures of agricultural commerce (local, national and international) and of bureaucracies, to ideologies of gender, caste and ethnicity and to institutional exchange arrangements for land lease and labour hire, as integral aspects of an expanded conception of agrarian structure.

Given the unique political success (in the Indian context) of the Left Front government (LFG) in West Bengal and its emphasis on the implementation of sharecroppers' rights, land redistribution and sweeping local government reform, it was inevitable that the implications for growth and equity of this set of policies would come under the closest scrutiny. Several papers were based on detailed study of the LFG practice at the micro level.

The final day of the workshop focused on the impact of agricultural growth in the two Bengals on the livelihoods of poor rural people. Here too there was a mixture of micro and macro levels of analysis.

This report offers a summary of the workshop, drawing on papers presented and some of the discussions which followed. The second section draws heavily on Sugata Bose's overview of the historical relationship between growth and structure in Bengal. In the third section, evidence on the rates of growth of production in the 1980s and early 1990s is discussed. This includes debate over the reliability of figures suggesting very rapid growth indeed in West Bengal. The fourth section summarises papers concerned with the relationship between 'structure and growth' in the last two decades. Micro studies of the impact of Left Front government reforms follow in the fifth section, leading into a discussion of the impact of growth on poverty in section six. The report ends with brief conclusions.

II
Historical Overview

Until the middle of the 19th century, crop output in Bengal grew, mostly at the extensive margin and largely driven by population increase. However, despite continued expansion of the net cropped area in East Bengal from 1860 to 1890 and demographically induced intensive techniques thereafter, Bengal as a whole experienced stagnation in agricultural production between 1860 and 1920. In West Bengal over that period, malaria and the decay of rivers led to a decline in both area and output [Bose 1993].

Between 1920 and 1980 the regional trends converged: stagnation in agricultural production coexisted with rapidly increasing population. In particular there was slow growth in the yields of aman paddy, which accounted for about half the gross cropped area in both East and West Bengal.

At the workshop Sugata Bose argued that research into the structural obstacles that may have held back growth in production should involve analysis of the role of the state – including, in the case of the colonial state in Bengal, its acts of omission in irrigation development and of commission in the modes of appropriation of the agrarian surplus over which it could exert influence. In their paper, Saugata Mukherji and Manoj Sanyal re-examined cropping patterns and output trends for the period 1900-1988

locating Bengal's agricultural stagnation until the late 1970s in conditions created by the colonial state: ill-defined property rights, differential access to inputs and resources and the failure of the state to revive canal irrigation and promote private investment in land and technological inputs.

However, Bose's paper also argued that agricultural commercialisation in the colonial era was the outcome of state imperatives as much as of expanding market forces. And it was made possible by the continuing non-commodification of labour – i.e. the reliance on family labour in peasant production.

In resolving the contradiction between the expansion of commodity production for capitalist markets and low levels of productive investment, Bose has shown that the surplus from production had been appropriated by a number of class fractions, including the colonial state, local landlords, metropolitan capitalists, indigenous merchants and moneylenders and rich peasants. However, the principal modes of exploitation and relations of appropriation have shifted over the last two centuries from being rent-based (in the context of the colonial revenue system), through credit and debt (from the late 19th century until the 1930s) to the land-lease basis of later decades. For the discussant, Rajat Ray, the key issue in the period prior to the Great Depression of the 1930s was why the domestic market for rice had not been expanding. The answer lay in structures of surplus appropriation which prevented surplus accruing to peasants and which thus dampened local demand. Bengal had had to achieve any increases in output through sales on the highly competitive international market.

Bose's paper also showed how, in the decades following independence, the impacts of agrarian structures on growth were indirect and context-specific. Those who appropriated surplus aimed to do just that. Holding back growth was a by-product. In many eastern districts, by this time in East Pakistan/Bangladesh, where smallholdings were predominant, richer smallholders leased out land in small parcels to ensure increased labour input. Production continued to be based on family labour. In western districts (by now in the state of West Bengal), also characterised by smallholdings but with a longer established agricultural labourer class and a more substantial rich peasantry, the latter maintained a wider range of economic activities and had access to higher prices for their produce. Increasingly richer smallholders in Bangladesh have used leverage to gain the major share of resources originating in foreign aid, while the same group in West Bengal have better access than others to capital-intensive agricultural technology.

In North Bengal (characterised by a rich farmer-share-cropping system), despite rapid growth between the 1940s and 1960s, class disparities widened, and agricultural labourers and sharecroppers became further impoverished. The question of the relationship between growth in agricultural production on the one hand, and absolute as well as relative poverty on the other, thus remains an empirical one for the present period as well. Papers which addressed this at the workshop are briefly summarised in section six. First it is necessary to ask whether the extraordinary rates of growth reported, especially in West Bengal, are based on sound data

III
Evidence on Growth in Agricultural Production

One of the major aims of the workshop was to carefully examine official data on agricultural production in West Bengal and Bangladesh in the 1980s and early 1990s. Recent statistical analyses of such data suggested that in West Bengal, growth rates for the production of foodgrains had been higher than in any other Indian state. Using the government of West Bengal' index of total output based on its own data, Anamitra Saha and Madhura Swaminathan found that the growth rate of foodgrains output in West Bengal between 1981-82 and 1991-92 was 6.5 per cent per year [Saha and Swaminathan 1994a:A-2].

The ensuing debate in *Economic and Political Weekly* [Datta Ray 1994; Saha and Swaminathan 1994b] highlighted the complexity of estimating yields, especially of the main crop, aman paddy. Multiple varieties of aman paddy are cultivated on varying qualities of land with major differences in yield between plots. Further, West Bengal has no reliable data on landholdings, both due to the legacy of the Permanent Settlement and to the lack of a 'potwari' system for keeping land records. So both measurement of yields via crop cutting samples and the calculation of district-wide data using area estimates require close scrutiny.

In reply to Saha and Swaminathan, B Datta Ray, the former director of the Bureau of Applied Economics and Statistics (BAES) in the government of West Bengal, argued that biases occurred in the sampling, which drove up estimates of production [Datta Ray 1994]. Saha and Swaminathan (1994b) replied that, on the contrary, if biases did occur they would skew the results downward. One possible source of bias was that towards late harvested paddy. Arrival at a sampled plot which had already been harvested would, argued Datta Ray, lead to selection of another later-harvested plot, which would likely to have been sown in a longer duration and therefore higher yielding variety of paddy. Saha and Swaminathan countered (1994b) that if there was a bias towards selection of longer duration varieties this would push yield estimates down as high yielding varieties tended to be of shorter duration.

At the workshop, James Boyce suggested that a major source of bias was the changing methodology for the collection and preparation of crop output data. Until the 1980s the state BAES conducted independent sample surveys for acreage estimation and crop cuts for yield estimation, based on the statistical methodology developed under the direction of P C Mahalanobis at the Indian Statistical Institute in the 1940s. The subjective estimates of the Directorate of Agriculture (DoA) – the state agency charged with implementing policies to boost agricultural production – could be checked against the BAES figures, and the BAES data were generally used as the basis of official state government estimates. In the early 1980s the DoA unilaterally began to 'adjust' some BAES estimates. In the mid-1980s the integrity of the data was further compromised as BAES sample surveys for acreage estimation were abandoned altogether, and official yield figures were converted to a simple average of the often quite divergent BAES and DoA estimates.

Boyce speculated that the true rate of agricultural growth in West Bengal in the 1980s may have been around 4 per cent per year. While not as spectacular as the rates estimated from the official data, this would still represent an impressive performance, far surpassing prior growth rates in the state and comparing quite favourably with agricultural growth elsewhere in India. The fact that this growth occurred during a period of modest but significant agrarian reforms is noteworthy, suggesting that greater equity is compatible with efficiency and growth. Boyce regretted that questionable changes in West Bengal's agricultural output estimation procedures have made it difficult to assess objectively the state's performance and to analyse these accomplishments. He strongly recommended that the *modus operandi* of BAES acreage and yield estimation be restored to its pre-1980s status; that separate publication of the resulting BAES data be resumed; and that official figures be restored to the earlier BAES basis.

During the presentation, Biplab Dasgupta argued that if the bias in yield reports had been constant over the 1980s, the rate of growth, which was the main focus of dispute, would have remained unchanged. Whatever, the actual rate of growth in agricultural production in West Bengal, the Left Front government has gained credit from the very high levels implied by official data [see, for example, *Business India* 1994].[4]

This growth needs to be put in context. Abhijit Sen and Ranja Sengupta used both state and central government data to compare rates of output growth of rice and total foodgrains among eastern Indian states and Bangladesh. Sen and Sengupta found that

Bihar, Orissa and West Bengal all moved to rapid output growth rates in the 1980s (over those of the 1970s) Growth in rice production in West Bengal in the 1980s was 7 6 per cent per year ' compared to 6 1 per cent in Orissa and 3 3 per cent in Bihar Productivity growth in the three states was 6 2 per cent 5 9 per cent and 5 2 per cent respectively For foodgrains as a whole production and productivity grew fastest in West Bengal (6 9 and 5 6 per cent respectively), followed by Orissa (4 7 and 3 7 per cent) and then Bihar (3 3 and 3 3 per cent) In another recent analysis Sawant and Achutha similarly report a general increase in foodgrains production in eastern India, with West Bengal in the lead (1995) It is this lead over the respectable performance of other states that requires explanation

Sen and Sengupta went on to show that the level of intensification of land use in West Bengal as indicated by the rate of growth of gross cropped area was unmatched in the other two states None of the three states consistently increased fertiliser, use of high yielding variety seeds or irrigation in the 1980s over the 1970s Sen and Sengupta admitted that the data on irrigation was flawed because it underestimated investment in private irrigation However they suggested that proxy indicators like increases in rural lending by commercial banks and electricity consumption could confirm that private irrigation was more important in the 1980s '

The overall picture of low growth in input use led Sen and Sengupta to conclude that West Bengal established a relatively high base level of inputs in the 1970s followed by increased x efficiency in the 1980s If this were the case (i e if motivation and effort applied to agricultural production increased in the 1980s over the 1970s and was much more significant in West Bengal than in neighbouring states) some of the credit might be laid at the door of the state government whose political and agrarian reforms could be said to have created the enabling conditions Boyce noted that an alternative hypothesis is that the output growth has been overstated in the official statistics

The paucity of data on yield and output is, however far greater in Bangladesh In contrast to the relatively rosy scenario painted by Richard Palmer-Jones (1992), data available at the workshop suggested that at the national level, while growth in agricultural output has exceeded that of population over the last two decades, there was no major shift in the 1980s compared to the 1970s and growth has not been on the scale reported for West Bengal

Sen and Sengupta analysed data from the *Bangladesh Statistical Yearbooks* of the Bangladesh Bureau of Statistics and found annual growth in rice production to have averaged 2 48 per cent in the 1980s and 2 66 per cent in the 1970s In Quazi Shahabuddin's paper, agricultural output was reported to have increased by 2 7 per cent per year between 1972-73 and 1992-93 Here too growth of output was found to be slower in the later period (1986 87 – 1992-93 2 7 per cent per year) than in the earlier period (1972-73 – 1985 86 3 0 per cent per year) Indeed, growth of rice production between 1989 90 and 1993 94 was computed to be just 0 48 per cent per year

According to Shahabuddin, the proximate cause of the growth in output for the period to the end of the 1980s was an increase in area under high yielding varieties of rice which in the early 1990s, accounted for 75 per cent of the gross cropped area and 60 per cent of the total value of crop output Although Shahabuddin attributed the recent growth in production to intensification of input use this raised rather than answered questions about the direction of growth Both the total consumption of chemical fertiliser and total irrigated area increased into the early 1990s The annual rate of growth of total irrigated area was 2 85 per cent in the 1970s, 6 21 per cent in the 1980s and 8 26 per cent in the early 1990s Why then were output growth rates in the 1990s so low ? Indeed why was there a decline in the acreage of boro paddy in the early 1990s ? Has there been compensating growth in the production of other crops ?

Given the recent history of stagnaton in agricultural output in Bengal as a whole, the growth rate of 2 7 per cent per year over the last two decades has been heralded as a success However when the apparent downturn of the early 1990s is set alongside the policy shifts towards deregulation of agricultural markets in the 1980s the role of liberalisation in providing incentives to greater production in Bangladesh remains a question for research

Thus while there is strong evidence from West Bengal to indicate rapid growth in agricultural output since the mid-1980s (even if the average annual rate was 4 to 5 per cent per year rather than 6 to 7 per cent), evidence from Bangladesh is much scantier and the growth less remarkable The available figures suggest a slow-down in the 1990s after modest increases in per capita agricultural production since the early 1970s

IV
Agrarian Structures and Agricultural Growth

The nub of the debate giving rise to this workshop lay in the question whether agrarian structure in Bengal acted as an obstacle to agricultural growth On close inspection, agrarian structure is about much more than the distribution of land and other assets among rural people and/or the organisation of agricultural production Even these factors varied widely across Bengal Moreover, structures of rural industry, trade and commerce, may be so closely interwoven with agricultural activity that the question requiring study is whether rural social and economic structures acted as obstacles to growth Structures may shape the pace and social distribution of the growth rather than simply restrict it Further, causality is likely to be complex, interactive and lagged rather than unidirectional, with growth impacting on structures as much as vice versa Papers presented at the workshop included investigations focusing on both directions of causality and varying concepts of structure, including land and other productive asset distribution, ownership and mode of allocation of irrigation water agricultural product markets, socially embedded labour exchange and ideologies of gender and social rank The rhetoric and practice of state policy' may also be seen as structural and papers focusing on this in West Bengal are reported separately in the next (fifth) section

Shapan Adnan's paper showed how the distribution of tangible assets (mainly land) in one ward in Pabna district shaped the process of agrarian technical change Contests between classes over resource allocation through both market and non-market mechanisms worked in the favour of the richest families Coalitions of rich farmers enabled the transition from a predominantly sharecropping rental system prior to 1971 to the appearance of fixed rent leases thereafter Adnan argued that the fixed rate system was an outcome of landlord domination because the tenant bore risk and paid regardless of output Rates were set on a take-it-or leave-it basis, with increases being led by one landowner and followed by the others Further productive accumulation was constrained by these changes as rich farmer practices aiming at rent maximisation caused the accumulation of land for further rent extraction It was much harder for poorer people to acquire shallow tube wells because of the convoluted procedure required to form a co-operative (mandatory in tube-well ownership until the mid 1980s) and the size of the bribes involved

Thus, for a period apparently dominated by state intervention in agricultural input supply, structure – in the form of class differences – influenced the direction of growth This in turn caused changes in agrarian structures – particularly in rental contracts Indeed shares were reintroduced for the renting of water Adnan explained this as the outcome of a balance of forces between waterlords and rich peasants owning plots in the command area The result for poor producers was a decreasing share of the agricultural product, as rent-receiving landlords increased their proportion of the surplus through rent hikes, and waterlords increased theirs through deliberate overpricing of water through the share

One key feature of rich peasants' class power was their capacity to bribe low level bureaucrats, elected office-holders, bank employees and others. Whereas this was crucial during the period under study – one of large-scale involvement by the state – class contentions under the liberalisation of agricultural markets require separate consideration. Adnan's central argument was that the incentive to extract surplus as rent was associated with a polarisation in which production on owner-occupied holdings was delegated to the poor. The implicit assumption here is that the changes in structure associated with technical change – particularly subinfeudation and unproductive investment – were outcomes of the initial structures and were responsible for low output growth. In discussion, Willem van Schendel argued that non-market resource allocation mechanisms (such as 'shalish, shamaj' and religious rituals, which were touched on by Adnan), non-agricultural activity and institutions of intra-household resource allocation had been neglected in this study and in the workshop generally. The question of whether such institutions moderate or exaggerate the unequalising impact of liberalisation remained unanswered.

Mahabub Hossain gave an account of changes in government policy towards agriculture including the privatisation of fertiliser distribution and the lifting of import regulations on irrigation equipment. He suggested that equity was adversely affected both by the continuing favourable access to credit of richer farmers and by the investment of the latter in shallow tube-wells. Charges for water in the command areas were higher to small farmers than to medium and large farmers. This supports the findings of Adnan's microstudy for the period leading up to 1986.

However, the dynamics of water markets reported in these Bangladesh studies contrast with those encountered by Neil Webster in Bardhaman district of West Bengal. Whereas in the former, water was allocated to landowners (albeit on an inequitable basis), in the latter, in the boro season, tube-well owners leased in the land in their command areas on a take-it-or-leave-it basis. Webster termed this 'water blackmail' – it is made possible by the monopoly structure of irrigation water ownership.

Geof Wood's paper also examined how different classes of actors in rural Bangladesh managed household survival and accumulation. Wood took an actor-oriented approach focusing on what people do, rather than what constrains/enables them. Making people rather than households central entails analysis of intra- as well as inter-household relations. Wood reflected, from numerous research rounds in rural Bangaldesh, on the broad structural trends towards (i) smaller holdings and (ii) the strong intrusion of agrarian capital and new technology. At the same time increasing landlessness was only partly absorbed by non-agricultural employment and there was a proliferation of roles, including the provision of water and other 'services'. Wood thus questioned whether the farm household remained the appropriate unit of analysis for studies of production relations in rural Bangladesh, as decisions were increasingly made around tube-well command areas (perhaps in arrangements akin to those reported by Webster from Bardhaman district of West Bengal) rather than on the basis of a household's total landholding. Indeed, the larger a holding, often the greater the number of scattered plots and thus the greater the complexity of transactions required to cultivate intensively.

Wood pointed out the recent rapid increase in the number of shallow tube-wells with command areas of 10 to 25 acres and the overall dependence on irrigation indicated by the 1990-91 figure of 50 per cent of net cropped area double-cropped (and 10 per cent triple cropped). In contrast to Adnan, he conceived of shallow tube-well 'services; as entrepreneurial activity rather than as a route to a rentier income for water-lords. Each command area had its own house rules, requiring different levels of cultivation intensity and an increasing likelihood that other 'services' such as ploughing would be provided by the tube-well owner(s). Increasing use of contract labour gangs might indicate the 'servicing' of plots across command areas. Nevertheless, while such complex arrangements may have been developing in the irrigation-dependent boro paddy season, in the aman season there were much higher prospects for the management of each landholding by the household owners of that holding. Although Wood's paper was largely speculative, it was based on over two decades of engagement with the Bangladesh countryside and its challenge to orthodox conceptions of agrarian structure deserves serious consideration. Wood emphasised the proliferation of non-agricultural 'services' but also raised questions about the sources of capital for investment in such activities and the subsequent distribution of surplus along lines of region, religion, class and gender.

Barbara Harriss-White's paper on agricultural markets in West Bengal also focused on the relation between growth and structure – particularly the impact of the former on the latter. Harriss-White's framework for analysing market structure built on a systems approach to agricultural markets which also attends to class differentiation within the system, to the functional differentiation of component firms, to variation in the competitive environment for contract formation and to the social and political embeddedness of exchange. Transactions in market systems for three staples (mustard oil, potato and rice) in three market centres in West Bengal (Memaral, Gulsi and Katwa) were examined. Trading firms revealed complex internal structures taking the form of a high degree of uniqueness of combinations of activities. These activities included buying, selling, brokerage, storage, processing, transport, the finance of trade and of production. Asset ownership revealed a highly skewed market structure mirroring to a large extent the distribution of land, including urban land and storage and processing sites. However, as in the case of mustard seed non-local, non-land based capital, was as much involved as local commercial capital, and qualified any simple relations of determination of market structure by the structure of landholdings.

Harriss-White found that growth in the marketed surplus in West Bengal has been associated with an explosion of petty trade in a political constituency generally favourable to the Left Front government. However, the state has effectively blocked accumulation in this sector (and therefore competition from it) by rationing licences to petty traders and continuing to try to protect mercantile magnates through legal arrangements guaranteeing local monopoly control over the wholesale trade, restricting processing technology to large scale and through subsidised credit targeted away from small traders. With the state's failing to implement regulated market law, much of such regulation has been left in the hands of collective institutions of civil society with oppressive, arbitrary and extra-legal penalties on (usually weaker) outsiders.

Harriss-White asked whether this economic empowerment of commercial magnates was international or had such research as hers problematising the development of small-scale petty trade simply not reached the regime? The Left Front government's focus on reforms in the structure of land ownership and in tenurial relations represented a concentration on structures of production to the exclusion of property relations in exchange and circulation. In the meanwhile a compro-mising accommodation had been developed between a powerful commercial elite and the state.

Suman Sarkar and Kali Shankar Chattopadhyay tackled the issue of whether growth and technical change in agriculture could dissolve the constraining institutions in which market exchange is embedded or whether market institutionssurvive, notwithstanding growth. Village level field research in the mid-1970s and now, in localities undergoing a variety of growth trajectories, was compared. In the 1970s markets were physically fragmented and socially segmented such that a spectrum of prices could obtain in a given location and point in time for a given crop, and such that intervillage price differences were greatest

than justified by transport costs alone Agricultural growth has brought about considerable change in marketing systems a reduction in the use of periodic marketplaces a great increase in itinerant trade and the creation of chains of agents bound by credit, the conversion of village traders to rice mill agents and increased price collusion by commercial rice millers Sarkar and Chattopadhyay concluded that commercialisation was relatively economically differentiating, that growth in the marketed surplus accentuated the economic power of the mercantile capitalist class and that liberalisation would increase their capacity to bias towards traders and away from suppliers the gains from trade

The structure of agricultural product markets in Bangladesh was discussed by K A S Murshid based on a collaborative study with Ben Crow [Crow and Murshid 1994] of Noakhali and Bogra districts Crow and Murshid found that in a relatively 'backward' region only 30 per cent of grain outflows were not tied Producers were obliged to sell to their creditors who were mainly merchants and absentee landowners In an 'advanced' region on the other hand 92 per cent of grain sales were not tied to loans and here the main creditors were friends and relatives These structural differences in the product market have been sustained by different institutional environments In the 'backward' area for example tied contracts between money and product markets have continued because of the oligopsonistic power of a transport cartel dominated by absentee landowners and backed by force depriving producers of alternatives

Ben Rogaly's paper discussed structures of labour exchange in West Bengal and stressed their importance for interpreting macro data on changes in wages and employment The paper was based on evidence from two localities one in an irrigation intensive area of Bardhaman district and the other in a rainfed area of Purulia district While wage data cited by Sengupta and Gazdar (forthcoming) for West Bengal suggested their rapid growth in the late 1980s and early 1990s coinciding with the rapid growth in agricultural output Rogaly argued that efforts to understand the impact of wage changes on poverty required data on the structure of labour arrangements Two components of structure were highlighted therefore

(i) the forms of social and economic differentiation both *among* agricultural workers and *among* agricultural employers in which labour supply and demand are embedded – these include landholding structures and ideologies of gender and caste, all of which change over time, and

(ii) the forms of labour arrangement or contract which also enable and constrain demand and supply 'choices

Rogaly found at least six different indigenous types of hired labour arrangement being practised in each locality Conventionally several of these are lumped together as 'casual' including individual – and gang based piece rate arrangements, seasonal beck-and call ties and daily time rate employment Yet, there were significant differences not only in remuneration but also in the types of social embeddedness of each one Variation in remuneration occurred *within* arrangement types Such differences were shown to be grounded in wealth differences among labourers, in gender and caste ideologies and in the detail of party politics

In analysing the impact of growth in production on the structure of labour exchange it was therefore necessary to track changes in the occurrence of different arrangement types and variation within each type Changes associated with the recent growth in agricultural production have included an increasing use of seasonal migrant workers (again raising measurement problems for one off annual or decennial surveys) and greater use of gang based piece rate labour As ideologies of work and employment shift and are contested and as local untouchable jati offer less labour for hire an increasing number of former seasonal migrant (often adivasi) have settled in intensively cultivated areas Analysis of the impact of the interaction between growth and structure on workers' livelihoods requires the tracking of changes in (i) hired labour arrangements (ii) the distribution of landholdings, and (iii) the often contrasting ideas of different jati about appropriate work place 'choices' for women and men

Jayati Gupta's presentation drew out the critical links between unequal property rights in land for men and women on the one hand and gender relations in the household and at wider levels on the other Drawing on evidence from Medinipur district of West Bengal in the late 1980s, Gupta also highlighted the importance of dowry in the reproduction of the land-owning structure The non-land resources of dowry enable land to be retained by the males in the natal household Equally this form of dowry may be used to capitalise land controlled by males in the bride-receiving household Greater co ordination was required between the women's movement and the 'peasant movement' in pushing the gender distribution of land owning rights onto the the policy agenda In discussion Naila Kabeer also emphasised how dowry became a key means of economic accumulation for those with sons showing the importance of studies of family size and composition to studies of household mobility

In his paper on wealth, power and status among CPM-supporter groups in rural West Bengal, Arild Ruud linked economic well-being to cultural change Ruud's main question was why the local party leadership of the CPM, many of whom were caste-Hindu in the Bardhaman district (West Bengal) villages where he worked, favoured certain groups of the poor - particular jati from among the 'scheduled castes' – and not others Ruud further argued that the 'civilisational' objectives of the CPM's cultural project (anti-casteism, teetotalism and literacy) followed closely from earlier cultural and social reform movements

Ruud described the operation of jati ideologies and how these structured the distribution of benefits from agricultural growth The two scheduled caste' jati discussed were Muchi and Bagdi Ruud argued that Bagdis, former lathiyals have benefited more than Muchis from economic reforms Bagdis have also been favoured in the selection of party candidates The party's civilisational project' has succeeded with Bagdis who are more scrupulous in religious observances than Muchis The Bagdis have become included in the sphere of power via their adoption of certain values Once Congress supporting liquor producers they became teetotal CPM-loyalists They have achieved higher literacy levels than Muchis indicating greater social belonging and status The Muchi attempts to raise their social status have been widely ridiculed and scorned In this way the paper weaves together (i) changes in the ideologies of two scheduled castes , (ii) the 'civilisational' ideology of certain caste Hindus and (iii) the distribution of political, social and economic boons of the 1970s and 1980s

Thus in the workshop agrarian structure took on multiple meanings Growth in Bangladesh has been shaped if not impeded by the prior distribution of productive assets The development and diffusion of irrigation technology may have combined with landholding distributed in fragmented smallholdings to move decision-making at least in the boro paddy season from household to command area By constrast in West Bengal, waterowners' use of monopoly power was described as 'water blackmail' Growth in West Bengal agriculture had led to an explosion of petty commodity traders, who were (whether intentionally or otherwise) constrained from accumulation by state policies subsidising trading, storage and processing magnates Growth in production also impacted on forms of labour exchange in West Bengal, with increases in seasonal migrant labour and piece rate arrangements in labour deficit areas However remuneration of agricultural labour and supply to different arrangement types was embedded in landholding structures and caste and gender ideologies, which were themselves contested and changing Household composition, particularly the number of sons and daughters had major implications for accumulation because of a system of property rights favouring sons and

the related dowry system. One micro study in West Bengal also suggested that where there were absolute gains among suboridate groups during the 1980s, they accrued to 'untouchable' jati favoured by the dominant peasant jati, who were also subject to the latters' 'civilisational project'.

'Policy' in Practice: Case Studies of CPI(M) at Village Level

In linking the Left Front government's agrarian reforms and Panchayati Raj to changes in agrarian structure or to agricultural growth, the history of smallholder movements and other agrarian radicalism in West Bengal should not be forgotten. In his paper to the workshop, Nripen Bandyopadhyay argued that both the relatively large percentage of land owned in holdings of five acres or less and the continuity of agrarian struggle in West Bengal since the 1940s created an enabling environment for the reforms. Others have argued that a tradition of grass roots activism was necessary for the reforms' success [Prasad 1995, cited in Balakrishnan 1995] Further, according to Arild Ruud, changes occurring since the late 1960s in terms of land redistribution and mobilisation by parties of the Left triggered cultural changes in the 1970s and 1980s. Like Ruud's the three papers summarised in the remainder of this section were taken from micro studies. All three focus on the practice of 'policy' at the local level since 1978.

Neil Webster used the local history of agrarian radicalism in a group of villages in eastern Bardhaman district to argue that collective action worked and that the Left Front government should take the opportunity at appropriate junctures to recognise the value of non-governmental organisations able and willing to facilitate collective action by landless people. In the 1950s farmers in the area had formed a service co-operative for shared storage, marketing and, later, mechanised ploughing. In the 1970s, when land was redistributed to some landless scheduled caste households collective cultivation had worked until the land could be allocated into separate holdings. The beneficiaries then preferred to cultivate separately.

Webster argued that collective action by poor householdsis located in a combination of a collective experience of deprivation (tied to exploitation) and a common social identity. Co-operatives may thus be appropriate in this area for the control of mini-submersible tube-wells (MSTWs), which have a larger command area than shallow tube-wells (STWs) and are known locally as 'minis'. Currently MSTWs are owned almost exclusively by colluding large cultivators. The latter co-operate over sites to avoid overlap and refuse to rent out water, thus acquiring land on fixed rent in the boro season via 'water blackmail'. If this continues, then the owners of very small holdings will be excluded (as predicted by Adnan for different reasons in villages in Pabna district of Bangladesh) and 'water blackmail' will provide larger colluding land – and MSTW – owners with high oligopolistic returns to boro cultivation

Webster suggested that this anti-poor outcome was not the intention of the Left Front government, but urged the latter to acknowledge the existence of new actors in order to encourage non-governmental facilitation of local constellations of the poor in irrigation ownership.

Dwaipayan Bhattacharyya's paper aimed to shed light on the ways the Left Front government used its engagement with the politics of agrarian reforms as a legitimacy-building exercise, as its component parties, especially the CPM, played on the existing balance of forces to retain power at the village level Electoral considerations cut across class or political divides The ensuing 'politics of middleness' (defined by Bhattacharyya as "a consensus evolving unifying politics of mediation between several sectional interests) did not alter the structure of inequalities in rural West Bengal. The paper also implied that the practice of the local branches of the constituent parties in the Left Front government contrasted markedly with the period of United Front rule in the late 1960s. It could be argued that the policy declarations of the first Left Front government in relation to rural areas were based on a class analysis relevant ten years earlier, when the vestiges of zamindari may still have been tangible, and class harmony ('peasant unity') between rural wage workers and middle (if not rich) peasants would have been more credible.

Glyn Williams' study of three Gram Panchayats in Birbhum district led to more optimistic findings. The interaction of agricultural growth and political change in the three villages where he carried out fieldwork in 1992-93 involved empowerment of the poor, which would not necessarily have been the outcome of either on its own. The increase in demand for labour together with the implementation of Panchayati Raj increased the bargaining power of labour. The former led to a decline in personalised employment arrangements because of which labourers were better able to shift support between factions They could thus use the vote for material gain. The presence of large numbers of 'untouchable' workers in one area was also associated with their 'takeover' of the panchayat, which would only have been possible with Panchayati Raj.

No general conclusions can be drawn from these three micro studies. The CPM has had unprecedented political success reflected in its repeated re-election to power in the vast majority of gram panchayats, panchayat samitis and zilla Parishads. Bhattacharyya illustrated graphically how, in order to achieve political success, it may be necessary to take advantage of rivalries between local leaders. While Williams' study suggests that poor agricultural workers have benefitted economically because of the political reforms, Webster warns that the control of irrigation water by owners of large holdings may be beginning to work against the interests of such workers.

VI
Poverty in West Bengal and Bangladesh

While growth in Production was rapid in West Bengal in the 1980s and ahead of population in Bangladesh over the same period, the discussions of 'structure' and 'policy' in the two sections above indicate the difficulty of immediately identifying changes in the well-being of rural poor people from macro data and of making inferences about poverty reduction *either* from agricultural growth *or* from changes in agrarian structure.

Recent trends in poverty in Bangladesh were examined by Zillur Rahman. Rahman argued that poor people had multiple earning sources, including self-provisioning agriculture, homstead production, petty entrepreneurial income and wage income. The household was seen as an unsatisfactory unit of analysis because it often broke down into sub-nuclear units or membership was transitory Further, poverty was about vulnerability to crises (both anticipated and unanticipated) as well as income. Gender disparities were common among the poor, with women accessing lower levels of nutrition and extreme poverty in female headed households

Rahman briefly summarised poverty trends in the period 1971-90 before focusing in more detail on the recent period Although absolute levels of poverty were especially bad after the disasters of 1971 and 1974, there was consistent improvement thereafter, stalling only at the time of the 1987-88 floods Since then overall improvement has continued. However, detailed data for 1990-92 indicated that while the number of people in "moderate" poverty declined, extreme poverty increased. In 1992-93, when rice prices collapsed, monthly expenditure data indicated a "consumption bonanza" compared to 1991-92. The very recent increase in rice prices due to fertiliser price increases have had very negative effects on poverty [Syed Hashmi, personal communication]

The main cause of the overall improvement over the late 1970s and 1980s was growth in annual crop output (estimated in Rahman's study to average 3.13 per cent per year)

which was greater than population growth. However, the scale of improvement was modest partly because of low levels of overall economic growth and partly because of the occurrence of shocks leading to the vulnerability of income gains to the poor. The lack of improvement in well-being of the poorest was partly due to the self-selection of moderately rather than extremely poor people to targeted programmes.

Sunil Sengupta and Haris Gazdar's work indicated clear increases in real wages in West Bengal correlated with the period of rapid agricultural growth (i e, since 1982-83) [Sengupta and Gazdar, forthcoming]. Although the neighbouring states of Orissa and Bihar also experienced growth in output and higher real wages, NSS data clearly indicated that the proportion of rural people below the poverty line in West Bengal declined between 1982 and 1987, while it remained stagnant in the neighbouring states. Infant mortality was also shown to have declined relatively fast in West Bengal. However, Sengupta and Gazdar's analysis suggested continuing gender bias in literacy and undernutrition.

Madan Ghosh and Tony Beck are carrying out field research into access of poor people to common property resources. At the workshop, Beck argued that studies of the impact of growth on poor rural people had neglected to analyse its impact on ongoing struggles over common property resources, including fuel, fish and gleaned grain. Further, he cited earlier research which had measured the additional income accruing to different wealth groups as a result of the installation of 14 shallow tube-wells in a village in 24-Parganas district (north). Income from the new boro paddy crops had accrued mainly to the richest groups, while the poorest, despite an increase in employment income, had gained much less. The quantity of grazing land available also declined. Beck argued that this increase in relative poverty mattered very much to poor people, who now experienced a lower quality of life, more important to them than incremental employment income.

The workshop thus presented a mixed picture of the impact of agricultural growth on poverty. While poverty in Bangaldesh decreased in aggregate, the position of the extremely poor worsened. In West Bengal, while many gained increased employment and higher wages, relative poverty had increased and the quality of life of the poorest may have decreased.

VII
Conclusion

The main question addressed at the workshop and requiring further research was how agrarian structures in the broadest sense shape the direction of agricultural growth and vice versa. This included the interaction of the gender, caste and class in differentiating impacts of growth and of state policy changes. It also included the ways in which patterns of agricultural (and rural non-agricultural) investment and accumulation are grounded in pre-existing relations of production. For example, research is required into how the gendered structure of property rights is related to such accumulation and whether existing inequalities between households shaped decisions to invest in shallow tubewells rather than deep tubewell or canal irrigation.

Further research is also called for into the nature of rapidly expanding new agrarian markets, including markets for water in the two Bengals. Are production decisions in rural Bangladesh increasingly made at the level of the irrigation command area rather than household landholding? What forms of social organisation can enable poorer households to control irrigation water to prevent further skewed accumulation? Are there roles for non-governmental catalysts of localised collective action as part of the West Bengal government's anti-poverty strategy?

'Policy' is not separate from structure. The West Bengal agrarian reforms of the late 1970s were clearly grounded in an earlier history of 'peasant' struggle. Does initial evidence from parts of the state suggesting that early implementation of Panchayati Raj increased the power of rural workers in bargaining for a greater share of the gains from growth reflect wider trends? What has been the impact of agricultural market deregulation in Bangladesh and how is it associated with slower growth in rice output in the early 1990s?

These emerging research agendas call for the use of longitudinal micro studies alongside secondary data. However, analysis needs to link local and regional with more widespread changes to include the penetration of global markets, imported products including inputs and machinery and the impact of increased tendencies to export production. Recent reports of high environmental costs to intensive use of groundwater, including arsenic poisoning [Jadavpur University 1995], warn against complacency over the sustainability of the new agricultural growth in the two Bengals.

Notes

[The authors are grateful to Nripen Bandyopadhyay, who co-directed the workshop in Calcutta. Thanks also to Arjan de Haan and Samita Sen for acting as *de jure* rapporteurs and to James K Boyce for his comments on an earlier version of this paper. Remaining errors are ours alone.]

1 The average annual growth in output of foodgrains increased from 0.6 per cent between 1969-70 and 1981-82 to 6.5 per cent between 1981-82 and 1991-92 [Saha and Swaminathan 1994a, A-2].

2 The trend growth rate in boro paddy production from 1979 to 1991 was 9 per cent per annum [Palmer-Jones 1992:A-130].

3 The workshop was hosted by the Centre for Studies in Social Sciences, Calcutta, in collaboration with Queen Elizabeth House, University of Oxford, UK, and the Centre for South Asian and Indian Ocean Studies, Tufts University, USA. It was funded by the Overseas Development Administration, UK. The workshop brought together 70 researchers, including a relatively large number of younger scholars, working on contemporary agrarian change in West Bengal and Bangladesh in Bengal. A volume of selected papers is being prepared for publication.

4 Conversely, in Bangladesh, it could be argued that in conditions of aid-dependency it works to the advantage of the regime to demonstrate low levels of growth in food production.

5 At the workshop, Boyce pointed out that this growth rate was pushed up by abnormally low output in 1981-82 and 1982-83. He estimated that the use of a kinked exponential growth model with a break point at 1980 would reduce Sen and Sengupta's figure by 1 per cent.

6 Although other sources report many shallow tube-wells in West Bengal as using diesel rather than electric poser, e g, Neil Webster's paper at the workshop.

Changing Terms of Political Discourse

Women's Movement in India, 1970s-1990s

Indu Agnihotri
Vina Mazumdar

The revolutionary changes which followed the two world wars created fora and structures that promoted debates on women's rights. By the beginning of the 1990s however, the international context in which the struggle for the advance of women's rights was being waged had been transformed Debates being actively promoted today twist the very premises and values on which the movement had been based It is against the background of these developments which have influenced the women's movement in India that one must evaluate the goals and directions of the movement and locate its strengths and weaknesses

I
Introduction

THE 20th century promoted the cause of gender justice by internationalising struggles for equality by women and other oppressed people Women's struggles against their subordination were intertwined in varying degrees with ideologies and movements based on the values of freedom, self determination, equality democracy and justice Confined earlier by locale or limited foci, these now found expression through movements against imperialism for national liberation and social transformation The defeat of fascism and the forced retreat of imperialism around the mid century paved the way for social advance of which gender relations were a key component along with the other broad objectives of human rights and the end of iniquitous social orders The revolutionary changes which followed the two world wars also created fora and structures that promoted debates on women s rights The International Women s Decade was initiated during this period of hope which also posited a new International Economic Order By the end of the decade, however, this hope was already shaky [Mair 1985] In the mid 1990s, the context in which the international struggle for advance of women's rights is being waged has been transformed Debates being actively promoted today twist the very premises and values on which the movement had been based Terms like empowerment, choice, reproductive freedom, spiritual autonomy, etc, are being appropriated by forces inimical to the goals of the women's movement Can the movement ensure the continued existence of fora to mount pressure for intervention in favour of more equitable gender relations – both at the level of international realpolitik as well as at ground level processes?

It is important to note these international developments since they have influenced the movement in India from the start If we were to spell out the parameters within which the movement developed in recent years, these would be (a) the decadal thrust provided by the preparations for the UN Conference in Mexico, and the initiatives coming forth from the Non-Aligned Movement in this context, (b) the history of and relationship between earlier movements for freedom, equality and democracy values which were subsequently enshrined as basic political tenets in the Constitution of India, and the constraints felt towards achievement of these in independent India and (c) the influence of ideas coming across through the various streams of the women s liberation movements of the west Thus equality, democracy and freedom were at the same time, actual national and ideological goals which the women s movement addressed in all their connotations including specific gender perspective and components

II
The Indian Movement

Although in India colonial rule and the freedom struggle marked the beginning of an awakening among women, differing streams within the anti-imperialist anti-feudal struggle posited different even contentious images of identities for women [Sangali and Vaid 1989] But the nationalist consensus symbolised in the Fundamental Rights Resolution of the Indian National Congress 1931 postulated freedom, justice, dignity and equality for women as essential for nation-building The Constitution assured these rights In the post-independence period, however women exploring avenues for socio-economic and political mobility came up against the limitations of a third world ex colonial state This posed conflicts between their new rights and the values carefully promoted by a longstanding patriarchal social hierarchy Social disabilities and gradual isolation from the politico-ideological struggles that were shaping the nation building process led to the fragmentation of the women s movement and the women's question faded from the public arena [GOI 1974, Mazumdar 1978]

This is not to imply that no struggles were waged during this period But, with the exception of the tempo built up before the passage of the Hindu Code Bill, 1956, these could not form the basis of spurring agitations which could catch the public imagination cutting sectional demands and organisations

In contemporary India the resurgence of the women's movement and its contours have to be seen in the light of (1) The crisis of state and government in the 70s going into the emergency (2) the post-emergency upsurge in favour of civil rights, (3) the mushrooming of women's organisations in the early 1980s and the arrival of women's issue on the agenda (4) the mid-1980s, marked by a fundamentalist advance and the 1990s when the crisis has deepened with regard to state government and society

The women s movement in India is one of the many burgeoning efforts at reassertion of citizen's claims to participate as equals in the political and development process This places it in a situation of direct confrontation with the forces of conservatism and reaction The fundamentalist onslaught in one country after another have exposed the vulnerability of women's advance in most places In the third world as well as erstwhile socialist states, however, the combination of these with the onset/ acceleration of free market capitalism has both strengthened the powers of the oppressors as well as created new instruments for hegemony, by weakening the balancing mechanisms and ideologies that sought to place limits on their rapacity In India the mid-1980s have seen an onslaught on even existing rights of women through a harking back to 'tradition' and culture' and the positing of images which emphasise women's reproductive role as the only natural, historical one The fundamentalist/revivalist face of many social movements today is directly opposed to the radical demands and upsurges coming from below

These decades in India have marked the end of the age of complacency apathy and acceptance of the existing social order Undoubtedly these stem from both problems of transition is well as the outcome of the world s largest experiment in democracy Shifts in foci and awareness of problems that impinged on women s lives, the social construction of gender relations and the identity of women from different classes in their attempts to resolve the problems of the national economy and polity occurred during a period of dissolving certainties that characterised local national or global systems

This changing character and the contradictions are reflected within the governmental structures and in a shifting attitude towards the women s movement A major question facing all governments in office has been how to respond to the movement and its demand to place the women s question on the political agenda The government s response has been teetering between responding to the conservative or the radical forces in dealing with the women s question

The women s movement in turn, has mounted pressures on the state and government from the opposite end of the spectrum itself experiencing major transformations it has grown immensely despite pressures from diverse areas Within the movement diversities manifested themselves in many ideological cleavages and fragmented regionally uneven growth But the issues on which women first articulated their visible opposition covered a vast terrain – ranging from those which were gender specific to those which impinged on citizen s rights class formations values and the direction of social transformation

The main concerns of the movement as it emerged were laid out in the issues opened up by the report of the Committee on the Status of Women in India (CSWI) which drew attention to the wide diversities in culturally prescribed gender roles in India's plural society The committee raised serious doubts about the development or modernisation models that not only ignored the real differences that revolved round caste class and ethnic history but exaggerated the influence of religion culture and social attitudes on gender role prescriptions Questioning the continued invisibility of women' in areas/sectors where they were largely involved the CSWI pleaded for a renewed concern that would reflect real life issues and aspirations of the majority of women [GOI 1974 3]

This disenchantment of women with the post-independence development scenario was not a stance dictated by exogenous political considerations Demographic indicators like the accelerated decline in the sex ratio, increasing gender gaps in life expectancy mortality and economic participation or the rising migration rate were disturbing enough Combined with this was the utter failure of state policy to live up to its constitutional mandates in any field of national development The CSWI noted clear linkages between existing and growing social and economic disparities and women's status in education, the economy, society and the polity [GOI 1974 234], putting the demand for equality on an actual historical terrain It also formed a starting point for women s studies [1]

In this paper we have confined ourselves to the movement's responses to violence fundamentalism and the debate on economic role and processes We have focused on these not only because of limitations of space but because we see a close link between the marginalisation of women as economic beings (a trend which is now on the rise despite the movement s interventions in the last decade and a half) and the rising trend of violence targeting women In India today the most modern techniques of propaganda are used to project women as consumers and reproductive beings rather than producers and, above all as members of one or other particular community which seeks to establish its political identity by right of birth, religion or culture Fundamentalism provides an ideological framework while globalisation and glorification of the market provides the operative instrument to demolish women's claims to equality freedom and dignity as individuals This awesome combination poses a challenge which is forcing women s organisations into rethinking, soul-searching and questioning of their roles and identities in the reshaping of the struggle

This, however does not mean that the movement has not intervened in other critical sectors that affect the overall processes of national transformation, e g, education, science, technology, research and development management of natural resources and food security We have here focused on three main aspects which are critical determinants in the struggle for gender equality

The focus on these themes reflects both the views of the authors as well as that of activists in the movement The method followed is one of fairly widespread consultation with activists through workshops organised in different regions to get a feedback on what activists considered to be the major issues looking back on the last two decades [2] The paper does not attempt to write a history of the movement It only focuses on the issues trends and challenges as these have emerged while locating women in the overall context of the complexity of India's social and political entity of a democracy-in-making, as well as a democracy endangered

III
Violence: Case of Expanding Arenas

From its earliest phase in the late 1970s the contemporary women's movement perceived growing violence as a major issue, bringing 'visibility' to the movement itself This identification violence has also been interpreted in many ways, by analysts of the movement Primarily of course, it has been seen as a 'rallying cry' or a 'rallying point'

Violence, however is perpetrated through the given institutions of the state, community, the family and society at large It draws sustenance from prevailing ideologies which seek to propagate status quoism through advocacy of 'falling-in-line', be it in response to transgression of social norms or laws, which are defended in the name of age-old customs and tradition, religious or caste identities, or even political dissidence Such status quoists perceived the movement's adoption of violence as a threat to basic social institutions like the family community and construction of gender roles developed by the elites and projected as universal to 'Indian' culture – at all levels Over the decades, however, there has been a change in this perception

Rape

It was the widespread national level campaign, in the course of 1979-80, on the Mathura case which brought women's issues onto the public agenda The Supreme Court's acquittal of two policemen involved in the rape of a minor tribal girl brought to the fore several crucial aspects of women's oppression, viz, the roles of class and caste in oppression of women, and the issue of accountability of public servants and the judiciary in achieving the constitutional guarantees These were pointedly raised by four law teachers in their protest to the chief justice

> Must illiterate, labouring, politically mute Mathuras of India be continually condemned to their pre-Constitutional India fate? [3]

Though the agitation sparked off by the Mathura case led to significant changes in the Evidence Act, the Criminal Procedure Code and the Indian Penal Code, including the introduction of a category of custodial rape, the changes introduced were not sufficient The concept of power rape was resisted and has only recently been admitted through an amendment in the Civil Rights Act Significant loopholes nevertheless remain, both with regard to the law and its implementation

While the movement's understanding of the issue has widened, success has been limited due to both lacunae in the conceptual definition as well as monitoring of procedures. The definition of rape does not extend to marital rape and anomalies exist between the Child Marriage Restraint Act and the rape law in that consent is not required for intercourse in marriage before the age of 18. Also, whereas the character of the victim is not supposed to be a consideration in determining rape, clauses in earlier legislation to the contrary effect continue to be used and even the Supreme Court has violated the principle of custodial rape on this count. There is also the element of 'provocation' or, as the Supreme Court put it recently while reducing the sentence in one case, inability to resist temptation so that rape became a 'crime of passion'. Apart from all this there is the inability and unwillingness of the state machinery to act in a manner as to collect evidence in order to prove rape. As has been highlighted in the case of rape of nuns in Gujraula, UP, the law leaves sufficient loopholes for agencies such as the concerned police and medical personnel to not act, with perfect impunity. Of late, the movement is emphasising the rising trend in child rape, and demanding new legislation to combat the trend.

Anti-Dowry Agitation

Of all the agitations focused on violence the one that most touched the public imagination, the media and the widest sections outside the pale of organisations, was that which protested against dowry and dowry-related violence. It is the anti-dowry agitation which emerged as a rallying cry.

The 'atrocities against women' headline, attracted attention in the post-emergency scenario of 'excesses', and the 'Brides Are Not for Burning' slogan focused media attention both in India and abroad on women's lives. The question has often been posed, whether it perpetuated the 'women as victim' syndrome? But for those who became crusaders in the fight against dowry the movement transmitted a pulsating sense of energy which over time got transformed into a brand of activism which asserted women's agency in social change. It was this public assertion of what had till then been seen as a private agenda, which shook older organisations from a seemingly unending slumber.

One of the amendments in the Criminal Law, Section 498-A, passed in the wake of the agitation, encompassed for the first time a definition of cruelty which included not just physical but mental cruelty as well. One of the most commonly used clauses in cases filed by women, the invoking of the clause has in effect focused on the issue of domestic violence. The successive campaigns brought into focus the trauma women undergo within the confines of the ever-enduring family, glamorised by policy-makers and elite groups in general, as "the basic foundation of Indian society".

By 1982 organisations in Delhi and elsewhere built up formidable evidence of dowry-related murders being passed off as 'suicide' or accidents [Kishwar and Vanita 1984; Kumar 1992]. In several cases activists had themselves recorded the dying declaration of victims and urged the courts to treat this as evidence. Newspaper headlines screamingly reminded readers that 'dowry deaths' were on the increase. But the government, the police and other official agencies alongwith society at large slumbered in insensitivity and the convenient middle class ploy was used to dismiss torture of a young bride as an 'internal family matter'. It was a consistent, widespread mass campaign both individually by organisations and jointly under the aegis of the Dahej Virodhi Chetna Manch (DVCM) that finally mounted pressure on the government to act, if only out of political expediency. The Law Commission undertook a *suo motu* study on improving the law to combat this social menace more effectively. The parliament appointed a joint committee of both houses of parliament to review the working of the Dowry Prohibition Act. Though members were drawn from all political parties, it included several leaders of national women's organisations and led to one of the rare occasions of "all the women speaking with one voice" [Government of India 1981; Palriwala 1985].[4]

What came into focus in the course of the campaign was a clear link between dowry and the urge to accumulate consumer items as well as mobilise resources to be used as 'investment' or 'capital' to start petty business or enterprise [Karat and Agnihotri 1993]. These facts were so stark that for the high court to assert that the giving of gifts was customary was sure to invite the wrath of women's organisations. The irony of the high court assertion seemed greater in view of the fact that in 21 years since the Dowry Prohibition Act of 1961, only one conviction had taken place.

However, as anyone in the movement would today testify, even as increasing 'cases' of harassment and torture are registered with the numerous complaint cells as well as legal aid centres, the menace of dowry has increased mainfold. Did the focus shift from fighting dowry to only highlighting dowry deaths, asks an activist? Why could we not end dowry, ask others? There are no simple answers. While analysts have critiqued the movement for an emphasis on legal remedies, the fact is that the movement addressed itself to much more, and also achieved more. The question that may be raised is, was it and is it possible to fight dowry in a social context where both caste and consumerism are penetrating deeper? Matrimonial columns of leading dailies now proudly classify advertisements along caste lines, and consumerism has spread its tentacles far and wide in Indian society. The DVCM's demand of comprehensive legislation including changes in the whole gamut of inheritance/succession/property laws has gone unheeded, prompting even feminists/ erstwhile feminists to "rethink" dowry [Kishwar 1988a; 1988b]. Dowry, far from being a 'deep-rooted' Indian tradition, is the fastest way to make quick money in India while also claiming social sanction and legitimacy [Srinivas 1983]. In fact despite the most visible solidarity shown on the issue in the media, concerned women parliamentarians and activists, the issue has today been relegated to the background from the public eye in the face of more 'immediate' and 'pressing' problems, which are not altogether separate from the social agenda inherent in the anti-dowry campaign. In fact with the given state of a son-preference in Indian minds amniocentesis and sex-selection also draw their rationale from the dowry menace

Amniocentesis and Sex Selection

In 1974 the department of human cytogenetics, All India Institute of Medical Sciences (AIIMS), New Delhi, started a sample survey with the aid of amniocentesis to detect foetal abnormalities. By 1975, the AIIMS knew that the tests were being followed by abortion of female foetuses. While the AIIMS tests were stopped by 1979, reports came in from Amritsar in Punjab where medical entrepreneurs openly advertised their services referring to daughters as a 'liability' to the family and a 'threat' to the nation's population problem. Expectant parents were exhorted to avail of the services of clinics to rid themselves of the daughters to come. At a meeting convened in New Delhi in July 1982 a three-point position was arrived at wherin: (a) government was requested to restrict use of amniocentesis to only teaching and research establishments; (b) the Indian Medical Council was requested to take severe action against members indulging in unethical practices; and (c) women's organisations were to remain vigilant against the spread of the practice for commercial purposes [Mazumdar 1994].

While government did issue some circulars to this effect, not such action followed. In the meantime the sex determination business had came to stay, with clinics spreading even to small towns and information on this count reaching families.

which were otherwise unaware of technological advances Today the business flourishes more rampantly in North India, where in some places which earlier practised female infanticide, female foeticide has come in From the south alarming reports have come in of the prevalence of female infanticide among the Kallars in Tamil Nadu Ironically, this was not a tradition of the community Approval and connivance for the practice are being granted by an emerging new prosperous community leadership which includes educated professionals as well as politicians

In 1985, The Forum Against Sex-Determination and Sex-Pre-Selection (FASDSP) was formed in Bombay The Forum addressed itself to the entire spectrum of new reproductive technologies It sought wider alliances, undertook surveys, and filed a public interest litigation A private member's bill introduced in the state assembly, forced the government to move into action The bill finally adopted by the Maharashtra government in 1988 had several lacunae as does the central government's bill passed in July 1994 A question that has arisen from these long campaigns and the debate is, what about the women who practise female foeticide or infanticide? The new law treats them as guilty and punishable But does a woman in India have the right to choose or decide?

Population Policy

A strange link has united sex-selection followed by female foeticide and female infanticide Both cite national population concerns as the instigation for these anti women acts The government of India's current efforts to formulate a new population control policy in consultation with or at the behest of its international benefactors, include a series of measures foisted on women after the initial attempts at vasectomy during the emergency period met with stiff resistance The notable features of this policy are that (a) it is premised on the assumption of the population bomb theory (b) women feature as the main targets since they are the agency of reproduction (c) the contraceptives include steroids and hormonal injectables with long term effects on the health of the user, (d) no provision/consideration for monitoring of impact [5]

Women's organisations have been fighting for several years against the entry of these hazardous contraceptives which exploit women's desperate need for safe contraception , and proposals for coercive 'fascist' punitive measures such as changes in the People's Representation Act to disqualify those with more than two children and in the Maternity Benefits Act to restrict the benefits up to two children, while increasing leave provisions for abortions. These concerns were articulated forcefully before a recent expert committee appointed by government of India to draft a new national population policy [6] The committee's report, while upholding gender equity as crucial, and declaring its position as pro-poor, pro-women and pro-nature, recommends disincentives and other measures that have united many women's organisations in protest and one woman member dissociating herself from the recommendations" [7] It has also stirred up a public debate

Political Violence

In a highly charged political environment, violence against women too is viewed through coloured lenses Whereas the movement has attempted to contextualise the woman victim on the basis of prevalent social inequalities, the prevalent divisions in society take the edge out of the condemnation of the crime *per se* Thus in every incident of violence against women the attempt is made to underplay the crime itself by focusing on the identity/position of the perpetrator as well as the victim in order to mobilise support on the basis of defined parameters of polarisation in the specific context These can be caste, community, regional or even politico-ideological Thus rape and other atrocities inflicted on women and others in Nagaland, Manipur Assam, Tripura, Punjab or Kashmir by the armed or par-military forces can be condoned by the administration as well as government under cover of action taken to put down subversive activities A more perverse definition of pro-national activity in complete violation of constitutional guarantees, human rights as well as women's rights would be difficult to find It is this 'teaching a lesson to curb dissidence (whatever its shape or form) which is disturbing Given the trend of growing criminalisation of politics in India this form of violence can be crucial in keeping women away from public life [8] In fact this also reflects a cynical societal response to transgression by women of given norms of social behaviour, which in turn are defined along lines of caste and status

This applies to the increasing social acceptance of violence against women In recent years there has been a spate of incidents of stripping, rape and other forms of humiliation inflicted on dalits as well as other women in different parts of the country in recent years This is in addition to earlier instance of lynching of women on suspicion of being 'witches' Many have seen in these the reflection of new political configurations and conflicts arising out of the aspirations of upwardly mobile backward castes This comes along with reassertion of authority by traditional community and religion based structures

Claiming sanction and power to wield authority on the basis of various brands of identities, there is in contemporary India a powerful ganging-up of conservative and reactionary forces which aggressively impose moral prescripts Where other processes fail, gender equality and women's rights to freedom is opposed through intimidation, humiliation and violence in complete violation of norms of civil society

What is important is that even as the movement for women's rights has strengthened, there is the opposite phenomenon of increasing social acceptance of violence and its use for political purposes This violence is limited neither to the personal sphere nor to the framework of man-woman relationships [Karat and Agnihotri 1993]

It is notable that response from social scientists on the theme of violence in general and specific to women has not been very illuminating There have been few studies of the patterns of violence or even causal analysis [Das 1990, Datar 1993] While the movement itself identified violence against women in many ways and has expanded its horizon in terms of definition of violence also, corresponding perspectives in terms of analysis of the phenomenon are singularly lacking Within the movement of course differing perspectives continue to persist While there is a shift away from the earlier emphasis on domestic violence alone, there is a simultaneous trend of subsuming other arenas of conflict – communal conflicts, fundamentalism, even economic conflicts within 'violence against women'? Conceptually, this gives primacy to a gender perspective, but it oversimplifies conflict in other spheres and other levels of societal existence, by reducing them to a one dimensional affair Such conceptualisation also ignores differences in perception of these varied conflicts among diverse groups of women

IV
Fundamentalism and Communalism

The wave of fundamentalist xenophobic upsurges sweeping across the world threatens the international women's movement as a whole In India the complex social structures, evonomic constraints and political opportunism have provided ample breeding ground for the growth of revivalist ideologies and identity politics These have adopted aggressive postures, showing scant regard for the Indian Constitution or the fundamental rights it guarantees All religious, ethnic or cultural fundamentalists are basically hostile to gender equality whatever the rhetoric they profess

As early as 1983, 'a deal' was reportedly struck between the government of India and the Akali Dal, spearheading the agitation for

a Sikh state, to withdraw the agitation if government of India accepted a separate personal law for Sikhs. The bill drafted by the Dal would have deprived Sikh women of their rights to a share in their fathers' property (provided under Hindu Succession Act 1956) of right of divorce except through the dispensation of the religious heads (against the provision of the Hindu Marriage Act), and would have legitimised polygamy through the custom of *chadar andazi*, claimed as a 'Sikh custom'. Protests from national women's organisations and others backed by several Sikh women including five village mahila mandals, apparently compelled GOI to change its mind and no bill was introduced.

1985 however marked a shift in Indian politics. Pro liberalisation statements and measures by the government on the economic front began to be combined with compromises and even advancing the cause of fundamentalists. People's disenchantment with the nature and pace of India's development was sought to be offset by successive governments by playing the communal card with each community to win their support.

May 1986 witnessed a total surrender by the government to Islamic fundamentalism. The Muslim Women's (Protection of Rights on Divorce) Act 1986 deprived divorced Muslim women of their right to seek maintenance under section 125 of the Criminal Procedure Code a secular law open to all communities [Engineer 1987].

The act came in the wake of a year long debate on the Supreme Court judgment in the Shah Bano case. While upholding a Muslim woman's right to this legal remedy not available to them under Islamic personal law, the court observed that it was high time for government to think of a uniform civil code. In the months that followed Muslim fundamentalists organised themselves for a show down with government accusing it of interference with Muslim Personal Law. It is no coincidence that the campaign proceeded alongside protests against the re-opening of the gates of the Babri masjid which Hindu fundamentalists claimed was the birth place of Lord Rama. Women's organisations campaigned and drew support from large numbers of Muslim women especially from the poorer sections, intellectuals and reform groups from the community against the bill. The Bharatiya Janata Party however, suddenly 'espoused the demand for the uniform civil code'. Muslim fundamentalists responded with the hysteria of 'Islam in Danger'. Despite sharp differences within the ruling party and the resignation of a Muslim minister (who had opposed the bill), the bill was enacted with the help of a three-line whip issued by the Congress to its members [Hasan 1989, Palriwala and Agnihotri 1993].

Petitions challenging the new law as anti-constitutional are still pending hearing in the Supreme Court. Meanwhile, organisations report that many more Muslim women come to discuss their problems and participate in other campaigns for women's rights [10].

In September 1987 in Deorala a village in Rajasthan Roop Kanwar, a young bride burnt to death sitting atop the funeral pyre of her dead husband, while several thousands of people watched and even chanted slogans glorifying sati. Though a few in the media came out with strong statements against the event, many played it up as if it was a return to pristine glory likening Roop Kanwar to a devi (goddess), who presented a sharp contrast to the urban elite westernised feminist women who had disowned their traditional values. Sati therefore was sought to be projected as a sort of ethnic re-assertion of indigenous womanhood [11].

The state government remained paralysed despite massive protests by women's groups and a court order to stop the celebrations of the event. But protests from all over the country forced the government of India to intervene belatedly with a quite unnecessary and ineffective law against both the act and the glorification of sati. A strange feature of this law is to make the victim if she escaped death culpable for attempted suicide [12].

Women's organisations, some scholars and legal experts argued that sati was murder that its worship in Rajasthan and elsewhere was being encouraged by the rich Marwari business community and the landed Rajputs. They also prophesied that glorification of such heinous crimes would encourage violence as well as the positing of a family and community bound identity for women.

Ayodhya: Prelude and Aftermath

In December 1992 when aggressive Hindu fundamentalists demolished a 500 year old mosque in Ayodhya claiming that it was a mandir (temple) which marked the birthplace of Lord Rama, the government's perfidy was fully exposed indicating the depth of the crisis of state and government. It also deepened cynicism about the state's legitimacy. The demolition also sparked off riots in several parts of the country.

The overtly political manipulations of fundamentalists also found other victims. Several scholars were threatened or harassed for not adhering to fundamentalist versions while writing cultural, religious or even literary histories with a gender focus. There have been several such indications of growing intolerance. These were not confined to any single community. Repeatedly during discussions on the movement activists expressed the view that countering communal politics is the greatest challenge before the movement. Many expressed the need to define religion and secularism as more positive, ethical values and to discuss links with other progressive organisations [13].

Activists express concern at the rupture with the essence of progressive movements of the 19th and early 20th centuries. The growth of a metropolitan culture and continued use of English as the *lingua franca* of officialdom often makes the non-English speaking feel alienated from the emerging elite cultural ethos. This disjunctive situation was capitalised by communal parties who stepped in to fill the void [14].

Of late there are many activists who have established dialogue with reform movements and women's groups coming up within the religious framework. It is argued that this is necessary since religion seems to be the only outlet sanctioned by society for advance of women's latent talents. There is also an ongoing debate regarding retrieving religion from fundamentalists and highlighting the progressive aspects of socio-religious reform movements. Others argue that such instrumental use of religion at this critical juncture of its politicalisation would not only be self defeating but might even prove hazardous since it may lead to the assumption that reform too can come only through preordained idioms in denial of secular space. Activists from minority communities argue forcefully that they can advance only if the majority does so. Respecting people's faiths is one thing. But excessive preoccupation with religious analysis within the movement would endanger the fragile solidarity that has been achieved [15].

The movement has sought to counter communal propaganda amongst women. Organisations have intervened according to their capacities in riot situations to provide relief as well as to start a process of dialogue between women of different communities. Apart from several local initiatives by the myriad women's organisations, at least two rallies of several thousand women each were held in Ayodhya 1989 and Lucknow 1992. Nevertheless, as had been witnessed on previous occasions when a clash took place between women and fundamentalism, the inaction of the government on the plea of neutrality was a stance which itself constituted an active intervention.

The fundamentalist/communalist organisations aware of the ferment in women's minds are today making a bid to channelise/harness the nascent consciousness about women's rights for their own purpose. Taking advantage of women's deep attachment to religion they are today floating new organisations and fronts such as the Hindu Mahila Sammelan and the Durga Vahini wherein women's role as mothers, progenitors and defenders of the faith etc, are highlighted along with their role in the family. Fundamentalists of all hues have moved in this direction.

and the class and gender bias marked out for criticism

The critique of macro policies basically adopts three thrusts (a) that they would enhance rather than reduce inequalities among the people in general (b) that this would make the condition of the majority of women already struggling for survival in the informal sector still more vulnerable and (c) they would contribute to the social turbulence and violence of which women and children are the major victims Critiques have also condemned violence stemming from the promotion of consumerist lifestyles through the mass media as such lifestyles trap women into the stereotype of being objects and subjects of consumerism [Bhasin and Agarwal 1984] It is important to note that the few important concessions wrested from the government in the poverty alleviation through economic development programmes provided some space for urban poor and rural women to use the opportunities made available to organise and articulate their demands However, the macro policies remaining untouched and unchanged continued the processes of marginalisation

The issue facing the movement today is about the relevance of these debates and efforts The earlier critique of macro policies was from a standpoint of introducing a pro women approach within the given parameters using the constitutional guarantees as the basic reference point Today Indian women feel that the structural adjustment programmes and the package of economic reforms threaten not only earlier gains but also the stated national goals by successive governments While the movement was critiquing the development model SAP has now removed the few regulatory/compensatory aspects of India s mixed economy leaving global market forces the sole players in the field The processes especially to those with inconvenient historical memories bear significant resemblance to what happened to the Indian economy and to women s role in the economy in particular during the colonial period [Krishnaraj 1988 Patnaik 1993 Krishnamurty 1989 Ghosh et al 1994 Mitra 1979]

This realisation has made unity amongst differing organisations easier to achieve today In a joint statement women s organisations asserted We say no to Dunkel no to GATT we oppose the unrestricted entry of TNC s into the Indian economy They argued that

> discussions on the impact of the new economic policies usually focus on the impact on the organised sector since women make up only a small percentage here it is assumed that the impact is minimal We need to unitedly and forcefully correct the picture In our multidimensional roles as workers as peasants as producers as citizens as mothers, wives, daughters, as women the economic policies hit us the hardest [29]

The overall impact of SAP has to be understood in the context of the overbearing reality that already 94 per cent of the women workers are part of the informal sector and that they constitute half the labour force in the unorganised sector [30] What is the future lying ahead for women in an economy which itself shall be struggling to find a space within the model of 'sustainable development' under the aegis of a carefully orchestrated Structural Adjustment Programme?

Conclusion

The contemporary women s movement in India spans a large canvas There are small groups as well as large national level organisations [31] While some are recent having been formed only over the last two decades, others go back to over 50 or even 100 years Some organisations focus on single issues while the mass organisations cover a vast range The organisational structure as well as activities undertaken differ

The movement has been fraught with tensions, rifts and differences, reflecting differing notions of what are women's issues or how the movement should proceed to focus on these In comparison with the early years of the decade, today it is much easier to come together With an experience of working together for over a decade and a half women s groups in the country are fairly well aware of the issues they agree on and where they differ However neither the agreement nor should the differences be seen as static or in a frozen time frame Whereas ideological differences remain and perspectives differ the overall thrust is in favour of unity in action [1]

The same attitude is reflected in the issues being taken up In the 1970s the movement took off as part of an overall build up against the authoritarian regime symbolised ironically by a woman prime minister It then got fragmented and even perhaps insulated For a while even overtly political statements were resisted Today it is much easier to come together even on a platform to denounce the economic and other policies of the government The 1990s represent a trough in the political graph where the need to join hands and build alliances with other forces is even greater

The women s movement has undoubtedly grown Its outreach is far beyond the figures of enrolled membership of organisations These have now to take note of the increasing articulation of confidence by women at the grass roots level Nothing illustrates this better than the response to the literacy campaigns in several states where earlier attempts to reach women had been abysmal failures At a general level it is estimated that two-thirds of the neo-literate learners as well as two-thirds of the volunteers are women [Government of India 1994] The impact of the literacy movement came to be highlighted in the context of the anti-arrack movement in Andhra Pradesh However another remarkable achievement in recent years has been the process set in motion by the implementation of the 73rd and 74th constitutional bodies which provide for 33 per cent representation for women in local bodies in rural and urban areas

Whereas observers rightly see in this a qualitatively new dimension that has been added to the women s movement through this development the depth and complexities of these linkages are yet to be understood In rural India as also in the cities it is the new found articulation and confidence which is coming into conflict with the consolidated combine of conservative social forces which draw strength from the regressive steps taken by government as well as political representatives of reactionary forces It is the latter which are today preparing to mount an onslaught through the political process to check women s halting steps to advance and strengthen democracy in India

Movement politics as it has developed in India tends to show up elements which are unclassifiable Ideological differences exist – but within a continuum – and tend to get blurred when strategic choices have to be made between priorities But the debates continue and the questions persist Is the movement s decentralised structure and multiple arenas of interaction a point of strength or weakness or both? Is the movement s excessive preoccupation with the state s development policies and legislation welfarist in its objective rather than 'feminist or radical' Does the extension of the issue of violence against women from the domestic to the social and political spheres indicate a backsliding or an advance? Or does it successfully combat the dichotomy posed between economic welfarism and body politics? Should the women s movement get involved with issues related to environment population child rights, globalisation/marketisation international debt burden all of which arise from its widening base at the grass roots level or should it retain its autonomy while restricting its focus?

Clearly as it has developed, the focus could not be confined to the issue of interpersonal relationships The limits to creating an essentialist, biological entity as well as identity of 'woman' have become only too obvious While the ideological outreach of 'feminine' identity politics has widened this spread has also demolished the fossilised image sought to be created From different starting points, organisations have moved towards a more holistic vision As

the proto-fascist undertones of political events/processes become clearer along with the state's surreder to them, the need to join hands is felt ever more deeply, lest we come out with a *cri de coeur* – "we have the movement but they (the other?) have the women". While the movement is aware of these challenges the strength of its grass roots support base provides a ray of hope that counter-actions and counter-ideologies are not impossible.

Notes

[This paper, commissioned for a volume of studies on the women's movement in different countries, was written on the basis of a process of wide-ranging inter-action in four regional consultations to incorporate activists' own perceptions of current challenges It was not included in the volume since the authors refused to comply with large-scale revisions in the text, deleting certain sections by the editor/publishers/the agency funding the study The deletions included the introduction and conclusion, the section on population policy as well as large parts of the discussion on communalism/fundamentalism, on the grounds of their not being "specific to the women's movement in India". Instead new paragraphs/pages were incorporated which contradicted the views of the authors The political context in which women's struggle was being waged in India was edited out altogether Reports of the consultations which provided the evidence for our analysis shall be published shortly

There is a wide difference in the age of the two authors of this paper However, both happen to be students of history What initially brought us together was the contemporary women's movement's effort in India to bring out a journal in English Vina Mazumdar was the first publisher of Manushi and, Indu, a member of its editorial collective Our link with the movement could be put very logistically – there is perhaps not a single joint statement/document of the women's movement which may have emanated from Delhi to which both or either of us, individually or as part of sponsoring women's organisations – the Centre for Women's Development Studies and the All India Democratic Women's Association, have not been signatories Our doubts, dilemmas and convictions in some way reflect the continuum of consciousness passed over from one generation of Indian women to another]

1 A recent study, making note of *Towards Equality* as a reference point, points out that as a "founding text" it is perhaps a good measure of "the contrast between the Indian movement and the movement in the US, which often cited Betty Friedan's *The Feminine Mystique* as the book that set the women's movement in that country going". See Tharu and Lalitha, K (eds), 1994, *Women Writing in India*, Vol II, OUP, p 101.

2 The first such consultation was held in Bombay where activists from Maharashtra and Gujarat participated. At a similar exercise in Calcutta, groups and organisations from West Bengal, Bihar and Orissa came together. The third consultation in Delhi brought together activists from the northern and central region and the southern region activists met in Hyderabad in November. Reports of these consultations shall be published within the year

LIBERALIZATION: INDIAN AND CANADIAN PERSPECTIVES

edited by G. N. Ramu and Vishwas P. Govitrikar

This volume brings together insights from eminent Indian and Canadian academics, government officials, industrialists and activists on such questions as the following

- Is globalization inevitable?
- To what extent are the economic policy changes in India and Canada crisis-driven rather than strategy inspired?
- What are the moral and practical implications of the impact of globalization on the poor and the marginalized?

Eminent contributors include Deepak Nayyar, W David Hopper, Isher Judge Ahluwalia, C Rangarajan, Shankar Acharya, M V Srinivasan, Raunaq Singh, Jim MacNeill, Anil Agarwal and Marjorie Griffin Cohen

1995 **128 pp.** **Rs. 225.00**

Employment Situation of Tribal Population in Orissa

1981 Census Data

K K Mohanti
Sakti Padhi

A closer look at the 1981 Census data shows that the tribal population of Orissa is engaged in mostly low-productivity, low income employment, i e, they are invisibly underemployed In terms of policy this means that employment creation for tribals must be linked to improved access to land and other resources

FISCAL crisis and balance of payments crisis affecting the Indian economy have become the centres of attention and discussion in both academic and policy circles There is, however, another quiet crisis which is equally, if not more alarming, namely that on the employment front According to the latest available data for the Indian economy (Table 1), the growth rate of employment has declined between 1977 78 and 1987 88 in all the major sectors of the economy except in mining and construction (which account for only some 4 5 per cent of total employment) To give one important and striking example in agriculture (which in 1987 88 accounted for 65 5 per cent of total employment in the economy), the growth rate of employment has steadily and sharply declined between 1972 73 and 1987 88 (Table 1) There has in fact occurred a fall in the *absolute* number of workers in registered manufacturing [1] Now this has been taking place in the face of what is by now fairly well established – namely an increase in the growth rate of GDP in the aggregate as well as in all major sectors, particularly in the 1980s This means that the employment-output ratio must have sharply declined in the 1980s, i e, employment growth is becoming less elastic (responsive) to output growth, a phenomenon which has been aptly described as 'jobless growth'

According to the Seventh Plan document, it was estimated that the labour force would be increasing at an annual rate of 2 56 per cent during 1985-90 and at 2 24 per cent during 1990-2000 [2] If the growth rate in employment during part of the Seventh Plan period was only around 1 55 per cent (Table 1), as against the growth rate of labour force of 2 56 per cent, it follows that the rate of unemployment must have increased sharply in the second half of the 1980s

In such a situation, the enormous task of ensuring employment to the incremental labour force is best seen in the following quotation from an important Planning Commission document.

> Labour force is projected to increase by about 37 million during 1990 95 and another 41 million during 1995 2000 Thus the total number of persons requiring employment would be 65 million during 1990-95 and 106 million over the decade 1990 2000 Employment growth in the aggregate over the estimated employment of 300 million in 1990 would have to be about 4 per cent compound per annum if the goal of providing employment to all is to be achieved by the end of the Eighth Plan and over 3 per cent per annum if it is to be attained by 2000 AD [3] This indeed is a tall order, given the historical rates of growth of employment in India To see the massive investment requirement of providing jobs for all unemployed over a five year period the estimated cost is known to range between Rs 60,000 crore and Rs 75 000 crore or between 18 and 22 per cent of the targeted public sector outlay of Rs 3,35,000 crore during the Eighth Plan [4]

It is in the light of this grim employment scenario that the Eighth Plan's thrust is purported to be what has been called an 'employment-oriented growth strategy', and the issues relating to 'right to work' in academic policy as well as political circles are raised It is in this context that it becomes important to examine the level of employment, rate of unemployment and

underemployment and what are some of their proximate determinants

In this paper, we choose to focus on the tribal population of Orissa for several reasons First of all, very little is known about their employment/unemployment status though there is evidence that the incidence of poverty is very likely to be significantly higher among the tribal population compared to the general population Second certain data on unemployment and underemployment exclusively for tribal population is available at the district level (though the reliability of these estimates can be questioned) from the 'Special Tables on Scheduled Tribes of the *Census of India* which make it possible to carry out certain analytical exercises

The paper is divided into three sections In the first section we shall examine the sexwise workforce participation rate for main and marginal workers[1] for the tribal population and compare the same with the general population Here the workforce participation rate will be taken as a broad indicator of the overall level of employment In the second section we shall look at the industrial classification sexwise of rural main workers in terms of three broad categories, namely cultivators agricultural labour and other workers (rural non agricultural employment) In the third section, we shall present the data for open unemployment and visible underemployment among tribal population sexwise (Here similar data for the general population is unfortunately not available from the census for the purpose of comparison) We shall then attempt to see the relationship between rates of open unemployment and visible underemployment on the one hand and industrial classification of workers on the other In particular we are interested in exploring the following hypotheses with district cross section data using simple correlations (a) Rate of open unemployment is a positive function of proportion of agricultural labour among main workers and a negative function of proportion of cultivators this effect is assumed to work through variations in access to land and inequality of landholding reflected in proportion of cultivators and proportion of agricultural labour (b) Rate of visible underemployment is a negative function of proportion of cultivators among main workers and a positive function of agricultural labour, again through access to land (c) Whether and in what way rural non-agricultural employment has any association with mitigating effect on the rate of open unemployment and/or the rate of visible underemployment

Workforce Participation

Before we move into the main concern of this section, let us take a quick look at the magnitude of the tribal population relative to the total population in different districts as well as the distribution of the tribal population across districts (Table 2) As can be seen, rural Orissa is home to some 5 6 million tribal (this is nearly 10 per cent of the all India tribal population, whereas the total population of Orissa is only about 4 per cent of the total all India population) In Orissa the tribal population accounts for nearly one fourth of the total population Among districts of Orissa, this percentage is between 40 to 60 in Koraput, Mayurbhanj, Kendujhar and Phulbani and around 30 in Kalahandi and Sambalpur districts whereas it is less than 10 in the coastal districts of Cuttack Puri and Baleswar Thus, the six districts namely Koraput (23 per cent) Mayurbhanj (15 9 per cent) Sundergarh (10 8 per cent) Sambalpur (10 2 per cent), Kendujhar (8 3 per cent) and Kalahandi (7 3 per cent) together account for 75 5 per cent of the tribal population of rural Orissa

Let us now take a look at the workforce participation rate (which is simply the crude worker population ratio, i e, unadjusted for age composition of the population) This is presented separately for main and marginal workers sexwise in the case of tribal population and general population (Tables 3A and 3B) It should be noticed from these two tables that the workforce participation rate (WFPR) is higher for tribal than for the general population While this is true in the case of main as well as marginal workers for both male and female workers, the difference is particularly pronounced in the case of female marginal workers This is seen to hold good for all the districts of Orissa as well, with the difference being particularly sharp in the four coastal districts of Cuttack, Puri, Baleswar and Ganjam (where the percentage of tribal population is relatively much less – Table 2) with respect to male and female main workers and female marginal workers

What this means is that significantly the overall level of employment and participation in productive activity and hence absorption of labour is higher for tribal than for the general population What this might signify will be spelt out in the end

Industrial Classification of Rural Main Workers

We now turn to see how rural main workers are distributed across major economic activities in terms of a simple three fold classification namely cultivator agricultural labour and 'other workers (which mean all *rural non* agricultural i e, non land based, activities) The relevant data are presented

Source Computed from data in *Census of India*, 1981 Part 16 Orissa, Part-III-A and B, General Economic Tables

in Tables 4A and 4B, for tribal and general population respectively

The following salient points may be noted from these two tables First, for the state as a whole the proportion of cultivators is higher for the tribal population as compared to the general population (for both male and female workers) At the same time, the proportion of agricultural labour is also somewhat higher in the case of the tribal population (this is much more so in the case of a number of districts) As a result, the proportion of rural non agricultural employment is more than double for the general population compared to that for the tribal population in the case of male workers and one and a half times higher in the case of female workers This is more or less true at the level of districts Second at the district level the proportion of cultivators is much lower and the proportion of agricultural labour is much higher among the tribal population than among the general population in the case of the coastal districts of Cuttack Puri and Baleswar for both male and female workers On the other hand Phulbani is the only district where the opposite is true i e here the proportion of cultivators is higher and of agricultural labourers is lower among the tribal population as compared to the general population for both male and female workers On the whole one could say that tribal male and female workers have relatively more restricted access to land depend more on agricultural labour and have far fewer opportunities for rural non agricultural employment as compared to male and female workers among the general population

Open Unemployment and Visible Underemployment

The census in its 'Special Tables on Scheduled Tribes', gives two kinds of data number of non workers seeking/available for work and number of marginal workers seeking/available for work We have taken the former as a rough proxy for number of persons *openly* unemployed (and then worked out the rate of open unemployment by taking the ratio of this to total number of main workers) We have taken the latter, i e those workers who are working for anything less than six months in a year (marginal workers according to the census) but seeking/available for work for a longer period of time, as the workers who are *visibly* underemployed (as distinct from *invisible* underemployment which refers to a situation in which a person is employed full-time [not seeking/available for work], but not able to earn a certain minimum income, i e, those who are engaged in essentially *low productivity* employment) The relevant data are presented in Tables 5 and 6

First, as regards rate of open unemployment, it may be seen that for Orissa as a whole, it is as low as 1 6 per cent for male workers and relatively higher (6 3 per cent) for female workers Among districts relatively higher rates of open unemployment are noticeable in Keonjhar district among female and male non-workers in Dhenkanal district for female non-workers and in Sundergarh and Mayurbhanj districts in the case of male non workers Though we do not have similar data for the general population to be able to compare according to the NSS data on employment and unemployment the rate of open unemployment for rural male labour force of Orissa in 1983 was 5 1 per cent Thus one could tentatively infer that the rate of open unemployment among tribal (male) population is not much higher than among the general population

Second as regards the rate of visible underemployment we find (Table 6) that it is very much higher among male marginal workers than among female agricultural workers with a lot of inter district variations But then as can be seen from Table 3A *male* marginal workers form only 2 per cent of the male population (and in no district does it exceed 3 per cent) therefore for the tribal population *as a whole*, even the rate of visible underemployment would not be more than say, 10 per cent (since females account for nearly 90 per cent of *all* marginal workers) except in Kendujhar and Dhenkanal districts

We have attempted to see how the rates of open unemployment and visible underemployment are correlated with the structure of employment by using inter district cross section data The simple correlation matrix is presented in Table 7 (tribal male) and Table 8 (tribal female) Some pertinent inferences that can be drawn from the estimated correlation coefficients may be put as follows (i) The rate of visible underemployment and the proportion of cultivators among main workers are significantly *negatively* correlated only for tribal male workers This is in line with our expectation and may be interpreted as follows a higher proportion of cultivators among main workers means better and wider access to land and hence a higher degree of on farm employment which makes some dent in the rate of visible underemployment (But it should be noted that the correlation coefficient is just about significant at the 5 per cent level) In the case of female workers the correlation coefficient has the expected negative sign but is statistically insignificant (ii) The rate of open unemployment is correlated neither with the proportion of agricultural labourers nor with the proportion of cultivators but is highly significantly correlated with the rate of visible underemployment This is true of both male and female workers However it is not obvious what this correlation means (iii) Finally, the level of rural non-agricultural employment is positively and significantly correlated with both the rate of open unemployment[7] and the rate of visible underemployment in the case of tribal male workers In the case of female workers the level of rural non agricultural employment is positively and significantly correlated with the rate of visible underemployment and negatively and significantly correlated with the proportion of cultivators among female main workers This perhaps means that the rural non agricultural sector plays a critical role in absorbing surplus labour from the farm economy

CONCLUSION

To sum up the main points in the case of the tribal population of Orissa there is a relatively higher level of participation in economic activity as compared to the general population (as reflected in the workforce participation rates) Second, the rate of open unemployment does not seem to be much higher among the tribal population than among the general population Third we have suggested that the rate of visible underemployment is not spectacularly high (though similar data for the general population is not available for purpose of comparison) Finally the tribal populations has much fewer opportunities for rural non-agricultural employment compared to the general population

From the above points we would like to draw certain general policy conclusions First, the tribal population is engaged in mostly low productivity, low income employment i e, they are essentially invisibly underemployed Therefore, the question of employment creation must be linked up with the question of productivity growth Second, improvement of access to land, non land and common property resources of resource poor cultivators, semi landless and landless tenant cultivators and agricultural labourers can make some dent on visible underemployment as our correlation exercise suggests Finally promotion of rural non agricultural activities with a high employment potential through incentives subsidies training and skill formation, and infrastructure development is a necessity since as the correlation exercise suggests the rural non-agricultural sector acts as a sponge for absorbing at least some surplus labour from the farm sector Some targeting of this towards the tribal population is called for since as we have seen the level of participation in rural non agricultural activities is much less for the tribal population as compared to the general population

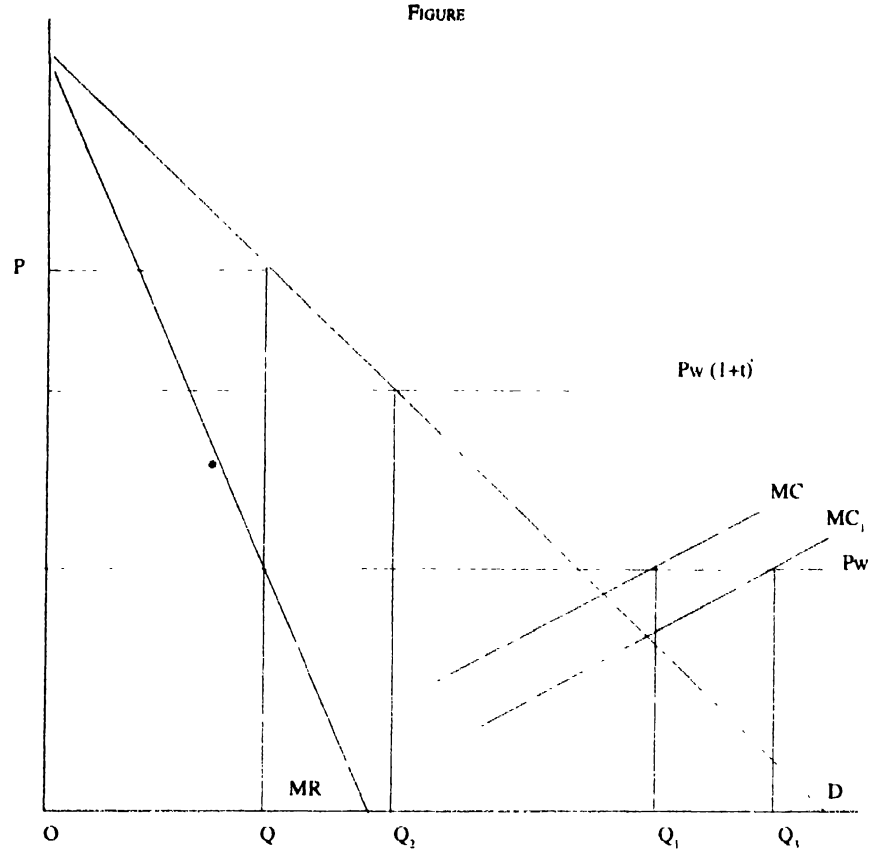
Import Protection and Exports

Murali Patibandla

THE note by Marjit and Sarkar (1995) in this journal attempts to show that reduction in tariffs on imports of a commodity could lead to decline in its exports. The arguments put forward by the authors is not only one-sided but also leave serious gaps in the explanation of the possible results within their model. This note shows by taking the basic model used by Marjit and Sarkar that reduction in import tariffs on a commodity does not necessarily lead to a decline in its exports. If one takes import tariff reduction to be both on the final good and also on intermediate goods used in its production, it should lead to increase in exports by shifting the cost curves downward. Analysis of exports in the context of the present policy reforms towards making policy prescriptions warrants a careful examination of the effect of liberalisation polices in general on the evolution of the domestic market structure and its implications on costs of production rather than going by piecemeal approaches.

I

We take the domestic producer to be a monopolist in the protected domestic market and a price taker in the competitive world market. In the figure, Pw is the world price line, DD is the domestic demand curve, MR is the domestic marginal revenue curve and MC is the marginal cost curve. A price discriminating monopolist maximises profits when marginal cost is equal to marginal revenues realised in both markets (MC = MR = Pw). The firm will produce OQ_1 level of output out of which it will sell OQ in the domestic market at price P and export QQ_1. It can continue to charge domestic price P as long as import tariffs (t) keeps the import price above P. Let us consider a reduction in import tariffs bringing in an import price line Pw (1+t). The firm cannot charge any price above Pw(1+t) as imports will eliminate the firm in the domestic market. At price Pw(1+t), the size of domestic demand is OQ_2, increased by the extent of QQ_2. According to Marjit and Sarkar all of OQ_2 will be catered by the domestic producer which leads to a decline in exports by the extent of QQ_2. There is no reason why one has to believe that at a price of Pw(1+t) only the domestic producer should satisfy all the domestic demand. The increase in the domestic demand might be satisfied by imports by the extent of QQ_2 in which case the domestic firm will continue to supply OQ in the domestic market and the reduction in tariffs will have no effect on the magnitude of exports. In such a case, the only effect of a reduction in import tariffs is reduction in the domestic market price and producers' surplus (excess profits) and an increase in consumers' surplus. One way exports could decline, within this framework, is if the monopolist decides to charge a price that is lower than Pw(1+t) (but higher than Pw) in order to eliminate imports in the domestic market. But this happens only when the total revenue she can realise with a domestic price that is lower than Pw(1+t) is higher than the total revenue she could realise by following the domestic price of Pw(1+t). This, in turn, depends on the price elasticity of demand in the domestic market and the extent of the difference between the domestic market and world market prices.



In the above analysis the cost curve is taken to remain unchanged after the reduction in tariffs. If trade liberalisation is taken in terms of reduction in tariffs on both the final good and also raw materials and intermediates used in its production it will have implications on the cost conditions. Reduction in tariffs on intermediate goods may reduce the cost of production and shift the marginal cost curve downwards as shown by the curve MC_1 in the figure. Consequently the total output will increase; exports increase to the extent of Q_1Q_2.[1] Within this framework, exports could decline if there is an upward shift in the domestic demand curve. One of the explanations provided by Patibandla (1992a) for the decline of exports of manufactured goods in the 1980s, when import liberalisation, especially of intermediate goods, was initiated is that the upward shifts in the domestic demand curve might have been more dominant than the downward shifts in the cost curves during this period. The 1980s was a period when the pent up demand of the middle-class for consumer goods was released. But as long as there is no significant increase in the incomes of the lower income groups (or if income distribution remains to be highly skewed), the outward shifts in the domestic demand curve will not sustain for a considerably long period.[2] In other words, once the domestic demand is saturated it is the downward shifts in cost curves that determine exports. The cost conditions depend not only on a given technology but also on the market structure conditions. If the market structure becomes very competitive (highly contestable) as a result of market reforms, domestic firms may have to compete with lower costs of making systematic technological efforts and improving upon the organisational efficiency (X-efficiency) which, in turn, will push cost curves downwards and contribute positively to exports. Lower import tariffs would prevent firms from charging high domestic prices (towards maximising producers' surplus) but they do not have to cause a decline in exports. In other words, tariffs could be used to discipline domestic monopolies and collusive oligopolies.

One of the explanations provided in the literature for the Japanese export success is that high levels of domestic market protection facilitated dumping in export markets. In other words, import protection facilitates the domestic monopolist to restrict domestic supply at a high price and subsidise exports with the excess profits made in the domestic market. This type of dumping strategies are necessary if domestic production costs are higher or equal to the international frontier. In the case when the domestic and international costs of production are equal, dumping strategies are used to eliminate foreign rivals in export markets through predatory pricing. If the domestic costs of production are higher than international frontiers and this gap widens, dumping strategies will be highly costly and will not be sustainable. In the case of Japan, dumping strategies were pursued along with consistent efforts at improvement of cost conditions.

II

The Japanese and South Korean policies are generally cited to justify the argument that import protection could lead to export promotion [Krugman 1984; Patibandla 1994]. Import protection in the case of developing economies (or newly industrialising economies) like India was justified on the basis of arguments of infant industry protection and realisation of static and dynamic economies of scale [Patibandla 1992a]. An important aspect of the Japanese and Korean policy frameworks is that they are a combination of trade and industrial policies under an effective institutional set-up. Promotion of domestic monopolies

FIGURE

through import protection and policy-based entry barriers provide domestic large firms sole access to the domestic market and facilitate realisation of static and dynamic economies of scale (dynamic comparative advantage). But the possible trade-offs of this is that in the absence of an effective disciplinary mechanism, domestic monopolies could derive monopoly rents without having to make any systematic and consisent efforts towards improving cost conditions which had been the case of several Indian industries in the past. In other words, high levels of X-inefficiency associated with monopoly power, in turn, could cause upward shifts in cost curves and decline in exports. The Japanese and Korean policy frameworks ensured that the firms that were provided with domestic monopoly status and other incentives like access to imported inputs at international prices performed accordingly with a 'carrot and stick' policy mechanism [Patibandla 1992b]. In the absence of an effective institutional (and domestic market) mechanism that could monitor and discipline domestic monopoly and oligopoly producers, lowering tariff levels on imports could be one of the possible means of disciplining them.

Notes

1 This result is also valid in the case of characterisation of domestic market structure in terms of Coumot oligopoly [Patibandla 1995]

2 Highly skewed income distribution restricts the domestic market size for manufactured goods This must not be interpreted to mean highly skewed income distribution is good for export promotion. See Patibandla [1992a].

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

THE JOHN D. AND CATHERINE T.
MACARTHUR FOUNDATION

THE MACARTHUR FELLOWSHIP FOR POPULATION INNOVATIONS 1995 - 96

The John D. and Catherine T. MacArthur Foundation is a private, independent grant - making Foundation dedicated to helping groups and individuals to improve the human condition Since it began operations in 1978, the primary objective of the Foundation, headquartered in Chicago, has been to encourage study and action in diverse field such as population, environment and natural resources, international peace and cooperation, and in the United States, health, education, mass communication and community organizing.

POPULATION PROGRAM

The most recent addition to the Foundation's field of interest is the Population Program, established in 1988. The Foundation perceives the need for population initiatives to go beyond the traditional boundaries to encompass broader social and economic contexts, especially gender relations. The Population Program concentrates its grant - making on reproductive health issues, the interaction between population and the environment, communications and education, and leadership development The program's work is mainly concentrated in four countries Brazil, India Mexico and Nigeria

THEMATIC AREAS

The India Program has identified Reproductive Health and Rights as areas which have been neglected. Reproductive Health implies not just the absence of disease or infirmity, but the ability of people to reproduce, regulate their fertility and practice and enjoy sexual relationship safely. It further implies that reproduction is carried to a successful outcome through infant and child survival, growth and healthy development. It also means that women can go safely through pregnancy and childbirth, when desired, and that fertility regulation can be achieved without health hazards

Reproductive rights include both the power to make informed decisions affecting reproductive health, as well as the access to resources to carry out such decisions safely and effectively. Reproductive health and rights of women depend on the creation of an enabling environment for women's empowerment.
The program invites innovative proposals which focus on.

- improving dialogues between women's groups, health care providers, policy makers, and others.
- providing sex education and information on STDs/HIV/AIDS to women and men of various ages, especially neglected members of the population such as adolescents,
- improving the quality of services and care in the area of reproductive health;
- drawing attention to neglected topics such as sexuality, gynecological and obstetric morbidity, maternal mortality, abortion, infertility, non - terminal contraception and reproduction choice,
- enlisting the participation of men in improving gender relations particularly in the area of sexual behavior and reproduction;
- conceptualizing and implementing reproductive rights within the framework of human rights and equity.

Underlying all activities is a concern for gender equity Preference will be given to projects that examine reproductive health within the broader socio - cultural and economic context leading to women's empowerment

THE FELLOWSHIP FOR POPULATION INNOVATIONS

The MacArthur Foundation Fellowship for Population Innovations is open to Indian women and men resident in any part of the country Candidates for a Fellowship may come from a variety of fields the academic community, social movements women s organizations, community action groups, the education and communication sector, law, health and other disciplines They must be in the mid stage of their careers and under 45 years of age Age restriction may be relaxed in case of women who have started their careers late or interrupted their careers The program is interested in identifying women and men with fresh ideas and demonstrated abilities to design innovative approaches that will have a long term impact in reshaping the population field.
Such persons will be supported for personal and professional development, that will enable them to respond effectively to the complex and multiple challenges of reproductive rights and health population growth, poverty and environment Funds cannot be used to support degree programs Preference will be given to individuals who seek an opportunity to develop personal capacity and knowledge

SELECTION PROCESS

Selection of fellows will take place once a year through a competitive process **The deadline for application is October 30, 1995.** Candidates may apply through an application form obtainable from.

New Institutional Economics

Neoclassical institutional economists have emphasised efficiency-improving institutional change through the reduction of transaction costs, placing much faith in the pricing mechanism being the driving force in resource-allocation, provided property rights are properly established But there is a need to develop more fully the scope of the theory of collective action, which has the potential to incorporate factors such as the sharply differing bargaining power of different socio-economic classes Under both approaches the focus has to be on the extent to which the prevalence of a highly unequal socio-economic structure and a state dominated by the propertied classes impinge on the capacity of temporary or specific voluntary groups to resolve short or long-term developmental problems **PE-65**

Cartography and Conquest

The emergence of modern cartographic representation in India is intimately linked to the colonial project of conquest, rule and administration After the early mapping efforts in the latter half of the 18th century, three major surveys the topographical, trigonometrical and revenue surveys – were carried out which were all crucial to the mapping of India **PE-87**

The Political after Modernity

What are the consequences of the challenge to the modernist interpretation of modernity by theory on the one hand, and by globalisation, on the other? What happens to notions such as national identity, sovereignty, citizen-subject tradition notions supported by the modernist understanding of modernity? **PE-104**

Reforms as Politics

The economic reforms are neither 'economics' nor 'reforms' but instead a political ideology to shore up support for the use of power of the governing section of the ruling class of resident non Indians **PE-73**

Dangers Ahead

The threat of a deepening of the dualism that already exists the possibility of erosion of some of the capabilities built up during the last four decades the need for wariness in dealing with MNCs and the importance of safeguarding national interests in the face of the inequities of the global market and the pressures of the global political configuration – these should be the major concerns relating to the future of economic reforms **1913**

Prehistory of Self-Reliance

The case of the Government Industrial Institute set up in Madras in 1919 and the problems at diverse levels raised by the experience of the institute – of provision of venture capital, of infant technology protection, of plain incomprehension of the issues involved –clearly form the prehistory of more recent lunges at self-reliance **PE-99**

Honorary Taoist

Joseph Needham's monumental *Science and Civilisation in China* reshaped perceptions of the non-west and raised important questions of historiography along the way **1904**

FDI and BOP Problems

In the aftermath of the debt crisis of the early 1980s the view that foreign direct investment has a more salutary influence on the balance of payments of the developing countries than debt finance has become widespread How valid is this view? **1921**

Empire of Chaos

US imperialism has reached a critical stage in its evolution the over extension of the empire is causing the downfall of the domestic economy and society Domestic economic reconstruction has been sacrificed for global corporate and financial expansion as the interests of the capitalist ruling class lie in foreign investment and global markets **PE-54**

Industrialisation: The Options

The West Bengal Left Front government's industrial policy hardly differs from that of the central government. The pursuit of such a policy by the Left Front cannot but weaken the struggle against the IMF-World Bank strategy, the offensive by international as well as Indian capital and the centre's new economic policy **1896**

Bihar's evolving new policies for industrial development should consider all the available options so that what emerges is a genuine alternative to the dismal policies of the centre **1902**

LETTERS TO EDITOR

On 'Bombay'

ASGHAR ALI ENGINEER in his article on Bombay (July 1) seems to have concerned himself more with the 'controversy than with the issues involved Having given details of the controversy around the film and having raised the issue of artistic freedom rather cursorily Engineer prefers not to raise more pressing questions about the nature of the film, as a finished product notwithstanding the noble intentions or otherwise of Ratnam It cannot be anybody's case that the film has to be necessarily viewed from a primarily sectarian/fundamentalist viewpoint as is being done by fundamentalists of one hue or the other A third viewpoint is also possible without falling into the acrimonious trap By all appearances it seems that Engineer has been more than concerned with projecting a 'moderate Muslim viewpoint in view of the rather 'queer' behaviour of the 'ummah' and the attendant scorching media gaze

There is no doubt that the film is valuable for its message of communal amity and brotherhood coming out strongly, as it does, against the mindlessness of communal riots and violence And much of the objection raised about the film, elopement scene included, hardly merits serious attention But seen more closely, the film does belie a lack of objectivity, however fictionalised, in its depiction of the chain of events leading to a harrowing national experience of the recent past and thus lacks any documentary value But then the wiseacres may very well question the desirability of taking the film as a reliable source for shedding light on a contemporary phenomenon However, going by the experience of the film 'Gandhi', it can hardly be denied that it seems to have disseminated, rather successfully at a popular level quite a different version of the Indian freedom struggle Engineer while concerning himself with the controversy and the issues of artistic freedom strangely fails to raise larger issues of artistic honesty at a given place and time This omission becomes all the more glaring in view of the fact that Thackeray remains fully content with a doctored version of the film and mind it, a 7-ft cut is quite a substantial one

Viewing the film, one is struck by the wonders of editing for frame after frame, it transpires at an abstract level, that the victims were, in fact, the aggressors in the first place, however tangentially Film making/censorship is not the innocent exercise it is made out to be and the behaviour of even the ever watchful censor board leaves no room for ambiguity about its actual working Nor can one assume Ratnam to be naive enough not to realise the implications Having compromised his artistic freedom once he can hardly afford to plead innocent What was expected from a critique of the film has hardly been attempted by Engineer But then, that would have required attributes other than just good intentions as would be evident from a reading into the critique of Roja carried by *EPW* in the recent past Alternatively, it would have required an Anand Patwardhan and a 'Father Son and the Holy War' for it is obvious that obfuscations however well intentioned hardly serve any purpose as far as an understanding into the nature of things or phenomena are concerned

EKRAM KHAWAR

New Delhi

Reorganising Universities

THE government is planning to permit the setting up of private corporate universities The idea needs to be discussed more thoroughly West Bengal appointed an education commission under the chairmanship of Asok Mitra Amrik Singh while reviewing the report has hailed it as the best report in recent time and has said it should be a model for other states to emulate An extract from the report quoted in the review makes interesting reading 'students prefer to elongate the phase of supposed education because of the grim prospects awaiting them in the labour market" In other words enrolment in university is looked upon as distinguished unemployment Later the commission adds "The country's authorities too have done their cost-benefit analysis, if a genre of social turbulence can be kept confined for an extra number of years within the low walls of a so-called university, a considerable saving of resources would take place at the other end, the creation of employment is (a) relatively a great deal more capital intensive ' (*EPW* July 17-24, 1993)

E M S Namboodiripad is equally forthright in his column in the *Frontline*, (March 24) He has suggested that more attention should be given to off . . diverse courses at this level, and there is a need to trim higher education He has used V I Lenin's interesting expression 'fewer but better Another question relates to elitism Dharma Kumar and Jayant Narlikar have argued that the disbursement of funds among institutions cannot be equal One cannot disagree with this argument This has existed even in former communist countries The question is in regard to the nature of elitism Many of these institutions are hot house plants without any organic link even with their discipline in question We have a truncated elitism There is a need to reorganise the system and sufficient encouragement must be given to elite institutions Sometimes anti-elitism becomes a cover for enjoying elitist perks without performing elitist tasks
